the bit of afternoon leisure that so breaks up the day; the time for cheerful chat at the meal's close, and the evening reading, these all cost little, surely, save tact and provision, the right arrangement of the day's tasks, and the best disposal of one's odd minutes. But they count wonderfully on the side of household cheer and contentment, they aid wonderfully in preserving the housewife's strength and serenity.

The cheerful look, the willing step, the habit of forbearance, the meekness of silence when any speech would only irritate. I would count these, too, among the things that cost nothing, if I were not convinced that these imply or involve a habitual self-control, a heart peacefulness, a deep-rooted cheerfulness, which it may take a lifetime to acquire. They are certainly unpurchasable by money or industry, skill or learning.

As I hinted just now, the things that cost nothing may help to win for us those better things that are among the "must-haves," as we think of life and its issues.

The treasured scrap of poetry or prose that held some helpful thought; the moments of thoughtful quiet, wherein, perhaps, both soul and body were refreshed for life's struggle; the neighborly call that blessed both her that gave and her that received it, and thoughtfulness for others that afforded a respite from one's own caretaking, are not these, for the most of us, available helps?

It seems to be too often a part of woman's work to make something out of nothing. We take upon ourselves such tasks to our own loss, and needlessly, oftentimes, in the realm of material and practical things.

But there is a field where such a talent may find fitting exercise. If any of us find ourselves endowed with this good gift, let us make good use of it.

GOLDEN GRAINS.

THE OBSERVER thinks that men who have no spirituality ought not to have any office in the churches. But there is need in many offices of a happy combination of spiritual life and financial ability. It believes that such a combination exists and that, where the proper steps are taken for the selection of officers, we can have such men in charge. If any church has chosen its officers solely on the ground of financial wealth, thus ignoring the spiritual qualifications, that church has, to its mind, taken a long step toward idolatry.....

DR. CUYLER says that Christ gives peace by healing the diseases of the soul. Instead of the wretched device of attempting to satisfy restless and unholy cravings, He expels them and brings in the new sources of joy. The world's false peace begins in delusion, goes on in sin, and ends in perdition. Christ's peace begins in pardoning grace, goes on in quiet trust, and ends in glory.....

LYMAN ABBOTT says that the results of reading are best preserved by communicating them to others. It is of little use to read to one's self, and never speak of what one reads.....

DO NOT permit yourself to make a positive statement even about a small matter unless you are quite sure; for if you do you will find the habit growing upon you, and by and by you will begin to make loose replies to questions of great importance. Don't be too certain.....

IF you have talents, industry will improve them; if moderate abilities, industry will supply the deficiencies. Nothing is denied to well directed labor; nothing is ever to be obtained without it.....

LET every dawn of morning be to you as the beginning of life, and every setting sun be to you as its close. Then let every one of these short lines leave its sure record of some kind thing done for others, some goodly strength or knowledge gained for yourselves. So from day to day, from strength to strength, you shall build up, indeed, by art, by thought, and by just will, an ecclesia of England, of which it shall not be said: "See what manner of stones are here," but "See what manner of men."....

NEXT to the comforts of religion are those of friendship and society, therefore to be friendless (as to this life) is almost to be comfortless; and to those who have had friends, but have lost them, the calamity is the more grievous. If our friends are put far from us by scattering providences, nay, if by death our acquaintances are removed into darkness, we have reason to look upon it as a sore affliction, but must acknowledge and submit to the hand of God in it.....

THEY asked Lokman from whom he learned good manners. He replied: "From the ill-mannered; whatever in their behavior appeared to me disagreeable, that I refrained from doing myself."....

Domestic Economy

CONDUCTED BY MRS. AGNES E. M. CARMAN.

"How true it is no spoken word can give
Form to the best of thoughts which in us live."

IN SEASON.

"COME out! 'Tis now September,
The hunter's moon begun;
And through the wheat and stubble,
Is heard the frequent gun
The leaves are paling yellow,
Or kindling into red
And the ripe and golden barley,
Is hanging down its head."

SEPTEMBER is with us! She was welcomed by the hunter, for now he can shoulder his gun, call his dogs, and direct his steps towards the fields and woods without fear of molestation. But the hunter is not alone in welcoming September—the lover of the oyster is on hand to do his share in greeting and welcoming back a month with an "*r*" in it!

The oyster is one of the most easily digested foods known. When an invalid is too weak and ill to eat or digest any ordinary food, he can almost always digest a few oysters. But if he should be too weak to eat even a few of these bivalves, he may relish some of the juice—either pure or with milk, cooked or raw—and this often awakens an appetite for other food. [Authorities tell us that the easy digestibility of the oyster is confined exclusively to the raw article. Cooking effects a change which renders the bivalve quite hard to digest.—ED.]

The oyster seems to have some mysterious effect on the lining membrane of the throat, stomach, and all digestive organs. I have known cases where people have had quinsy sore-throats and have been unable to take any nutriment at all for days, yet they have swallowed raw oysters without any difficulty—thus gaining nutriment and also soothing and cooling the throat.

Dr. Kitchener, who wrote the "Cook's Oracle," says, in his book: "Shell fish have long held a high rank in the catalogue of easily digested foods; of these, the oyster certainly deserves the best character."

It is said that the oyster, with the exception of the egg which some claim may be cooked in over 600 ways, may be cooked in a greater variety of ways than any other diet; but, unlike the egg, it is eaten raw. Almost all oyster lovers relish it in this form; but it seems to me it is an acquired rather than a natural taste. Of course, to eat it raw we must have it immediately it is opened.

In an old book published in England in 1817, entitled "Aspicius Redivivus," we find the following: "Nothing appears to common people more indifferent than the manner of opening oysters, or the time of eating them after they are opened. Nothing, however, is more important in the enlightened eyes of the experienced oyster-eater. Those who wish to enjoy this delicious bivalve in its utmost perfection must eat it the moment it is opened with its own gravy in its under shell. If not eaten while absolutely alive, the full flavor and spirit are lost."

Thus we see that oysters on the half shell were appreciated then as well as now. Still that is not surprising when we remember that the epicures among the ancient Greeks had slaves to stand by their tables and open oysters while they ate them.

Just here I might add that the New-Yorkers have a sort of a reverence for the oyster, and look upon it as do the Philadelphians upon terrapin; the Baltimorians upon the soft shell crab and the Washingtonians upon the canvas-back.

I might talk on the theme of oysters *ad infinitum*—and yet not say anything particularly interesting to farmers. They will not be likely to care for their oysters gotten up into all sorts of fancy dishes—I'm sure I don't—so I will confine myself to a few ways of preparing them—simple, yet toothsome.

PLAIN STEW.

Strain the juice from the oysters into the pail in which you wish to cook them: add about the same quantity of sweet, fresh milk. Place over a hot fire. When this liquor comes to a boil add the oysters. Let them remain only long enough to get heated through. Add a generous lump of butter, and pepper and salt to suit the taste.

OYSTER OMELET.

Put half a dozen plump, large oysters in their own juice, into a stew pan on a clear fire, take them off at the first boil, drain them, cut them in halves and spread over the omelet (made in the usual manner) when it is ready to turn. If the oysters are large and solid the half dozen will suffice for two ordinary omelets. As some of our readers may be new beginners and know nothing of cooking, I might add the "*omelette au naturel*," as the French say for the plain omelet, is made as follows: Three eggs, two tablespoonfuls of cream (milk will do of course) one-half salt-spoon of salt, one ounce of butter. Beat the eggs, cream and salt lightly together until froth begins to rise, but no longer; pass them through the sieve, if there should be any hard bits of yelk. Have your pan (iron) hot and well greased with butter. Pour into this pan and as soon as at all firm turn—etc.

OYSTER PATTIES.

Take about 100 fresh, opened oysters; put them in a saucepan over a quick fire, and let them boil, skimming well of course. Then strain them dry, keeping the liquid in which you have boiled them. Take about three table-spoonfuls of fresh butter and the same quantity of flour; mix well; put over the fire and let it simmer until of a nice color. Then add the liquid in which you cooked the oysters, and about two pints of sweet cream (or milk if you cannot get cream.) Season well with salt, pepper, a little nutmeg, and a very little Cayenne pepper. Then let it boil about 20 minutes; strain; add the oysters and finish with a little butter. Then take the material meant for crust (there are a number of ways of making this, and most housewives prefer some certain method—but if any should wish a special recipe I can furnish it) and roll out to the thickness of a quarter of an inch, and in a square shape; cut out the patties with a tin cutter, round or oval, as wished, place them on a cake pan, which must not be too thin, and must be wetted with water. Take one egg well whipped, and a few drops of milk. With a brush color the tops, without touching the sides; then, with a smaller tin cutter (half the size of the first), mark the patties, but not too deeply, in the center, and slip in an oven hot enough to roast chicken. When cooked, take out the centers with a small, pointed knife. Fill, and then use the centers as covers.

PLAIN FRY. Select large, firm, fresh oysters. Beat an egg and into this dip the oysters, then into some cracker dust, or finely rolled bread crumbs. Fry in *hot* butter. Season to suit the taste. Let them fry until they are a golden brown. All surplus grease may be done away with if the oysters are laid on a sheet of clean manilla paper for a moment or two before serving.

"No dainty yet prepared on earth's broad range
Can match thee fresh from out thy pearly cloister;
Thy name? We'll breathe it—Shakespere's line to change—
Unrivaled dainty! sure, thy name is *Oyster*!"

Apropos of oysters, let me tell the RURAL readers that they number a rhymster among them. A mother was reading something about oysters the other evening, when some one declared that reading of them made his mouth water. The mother then promised that on the morrow the family should have some. When the morrow dawned one of the children called from her bed: "Say, I've made up some 'poetry!'" On being pressed to let the others hear it, she blushingly gave the following:

What is that frothing, steaming mess,
Yon chubby little boy stirs?
I surely think that I can guess,
It is—it *must* be—oysters

The family all laughed and the little miss scarcely knew whether to feel offended or flattered—still I think she won't care when she sees it in print, and probably you may hear from her again.

DORA HARVEY VROOMAN.

BLACK Armour silk is liked.

FRINGES are to the fore.

GRAY felt hats trimmed with black are to be worn.

BONNETS or toques made of the dress goods—whatever the color—will be embroidered and trimmed with black.

BLACK dresses will be fashionable this winter and will be worn by both young and elderly ladies.

THIS is the way that Harper's Bazar would trim a gray felt sailor hat: The band around the crown is of black velvet with two folds of white crape above it. On the left is a large rosette of white crape and a white bird with spread wings.

A CAUSE.

IN the RURAL of August 31, I read with much feeling "A Few Observations on Table Manners." The writer either ha been educated wrongly; had grown up selfish; was averse to the society of children or was an old maid. The young lady of 15 was, without question, an only child of a thoughtless, indulgent, unobserving mother, who believed that custom and society in later life would correct habits so long neglected that they had become a part of her nature. The error here lay in the careless training of an indulgent mother, and business-absorbed father. I hold that when the child is old enough to speak, it is old enough to understand and reason, and what *nurse* can convey to the tender mind, the clear, concise ideas that the loving, faithful mother can? Mrs. White's children not allowed to come to the table until 10 years of age! Sad, indeed! The tender child banished from the mother's presence during the most important part of its young life—meal time.

Is a person who is interested in her charges only to the extent of her wages, and who knows naught of motherly instincts and feelings, capable of guiding and directing the manners of a child? Not half of the nurse-girls can read and write, and that they, with their stunted and starved minds, to say nothing of worse failings, should be given the entire charge of young children, (as is often the case) certainly shows criminal negligence on the part of the parents.

True, there are exceptions, but I speak of the masses. We pick up Bridget just from the Emerald Isle, who cannot speak a word without a brogue, and commit the infant to her charge—she to mold the impressionable mind and to cultivate refinement! Take the child from the nursery when old enough to sit alone in its little high-chair, and place it by your side at the table, and then in gentleness but with firmness begin its education "in table manners." You will be astonished at the advancement made through observation alone.

The best bred families I ever saw were those who received their training in the very lap of infancy. I visited a family where the child of two and a-half years of age occupied her place at the table with as much grace and ease as any of the guests; never speaking unless spoken to; always asking with a "Please give me" etc., and when through she would sit quietly till all were through, when she would say, "Papa, please excuse me," and when answered would bow to the guests and go to her play quietly. This child never asked for a dish until it was passed and when helped would say: "Thank you!" If you wish your children mannerly you must set the example. Your manners must, however, be such as are not taken off and put on upon occasion. They must be with you every day, every meal, every hour. Never ask or give without a "please;" never accept without a recognition of the favor. But talk about a child not being allowed to come to table until 10 years old! Why not say 20 as well. Begin its training when it is not older than two years of age; and with a gentle, loving hand guide it, and you will be astonished at the progress made. Have a bib and a table tray, and go gently to work. Away with all interference. Keep cool under all circumstances; have complete control of yourself and before you can credit it, you will have a little lady or gentleman at your table and you will have been the molder. What do you know of the actions, talk, examples; what of the

When Baby was sick, we gave her Castoria,
When she was a Child, she cried for Castoria,
When she became Miss, she clung to Castoria,
When she had Children, she gave them Castoria

food prepared and given; in fact, what do you know of the physical and moral training of the little being that God has placed into your keeping if you leave it to the care of the hireling nurse? I know there are exceptions, but when I speak of the masses of German, Irish, and negro nurses, I speak advisedly when I say that they are wholly unfit for their duties.

Household pets! In what can they equal, or approach, the child treasure—God's greatest gift? Everything sinks into insignificance beside that, though I have seen a mother consign her child to the nursery and the nurse while she came to the dinner-table and placed her poodle dog on a chair at her side. Insist by example and teaching that good manners are the commodities of every-day life. I say, emphatically, have your children so obedient at home that it will be the delight of your friends to have them accompany you when you visit them. A thorough mother will first study her child (she will not study the nurse until afterwards). And then, if compelled to employ a nurse, she can judge correctly what is required. Then, with constant oversight and frequent presence, there will be few fruitless after regrets. HENRY OLD COMER.

THE "Mail & Express" says that it is very difficult to tell the truth under "fashionable" circumstances.

TIMELY.

HAVE you ever tried musk-melon sauce? It is rich and delicious. Remove the seeds and skins and cut in small, square pieces. Cover with sweet cream, add a little sugar, and serve at once.

WATCH the little ones as the nights grow cool and take care that they do not begin to "curl up in bed." Does not the habit of sleeping "all in a heap" cause round shoulders and sunken chests? Will some writer for our splendid "Domestic Economy Department," give us a few ideas on this subject?

BAKED TRANSCENDENTS.

CHOOSE those of the same size with stems. Wash, remove the "blossoms," stand with stems up. Pour a little boiling water into the dish, and sprinkle on them a few spoonfuls of sugar. Bake in a rather quick oven. Nice for dinner with meat dishes.

TRY some dried ones, this year, too. Quarter and core them. With a darning-needle string them on white cord, and hang near the kitchen fire. They make good pies, having a pleasant, peculiar flavor.

Will some one, please, tell me how to make jelly from these little apples? I have tried, but without success. I should like the information soon. MRS. LEVI H. NILES.

EUGENIA CAKE.

ONE egg, one cup of sugar and one-fourth cup of butter beaten together, one-half cup of milk, two cups of flour, one tea-spoonful of baking powder and a little cinnamon.

SOFT GINGERBREAD.

ONE cup of molasses, one cup of sugar, three-fourths cup of shortening, one cup of sour milk, two tea-spoonfuls of soda, two tea-cupfuls of flour (a little more may be required). MRS. GULLEY.

GINGER CAKE.

ONE-HALF cup of brown sugar, one-half cup of New Orleans molasses, one-half cup (scant) of butter, one-half cup of milk, one egg, one and three-fourth cup of flour, one tea-spoonful of baking powder. If you use sour milk, use a very scant tea-spoonful of soda. MRS. A. W. FARWELL.

CREAMED SALMON.

MAKE a cream of one pint of boiling milk into which pour two table-spoonfuls of corn-starch dissolved in one-half tea-cupful of milk. Add a table-spoonful of butter and pepper and salt to taste. Butter a baking dish, line it with bread crumbs, cover with a portion of the cream, then a layer of salmon, which has had the bones and skin removed, then another of bread-crumbs, cream, etc., finishing with crumbs. Bake from 15 to 20 minutes in a hot oven.

MISS J. COLLINGWOOD.

BUTTER SPONGE CAKE.

TWO CUPS of sugar, one-half cup of butter, three eggs, one cup of milk, three cups of flour, one and a-half tea-spoonful of baking powde.. AUNT ANNA.

BOILED FROSTING.

ONE cup of sugar and four table-spoonfuls of water. Mix and boil until it hairs, stirring constantly. Beat the white of one egg stiff, add and stir until cold. Flavor with vanilla, rose or orange.

CREAM FOR FILLING CAKE.

ONE-HALF pint of milk, one egg, one heaping tea-spoonful of corn starch dissolved in cold milk, two table-spoonfuls of sugar. Flavor.

CHOCOLATE FILLING.

THREE squares of melted chocolate, one-half cup of sugar, mix smooth and add milk until of the right thickness to spread. Boil until smooth. Stir until cool. Flavor and spread. MOLLIE W.

SNOW CAKE.

ONE cup of sugar, one-half cup of butter, one-half cup of sweet milk, whites of three eggs, one and a-half cup of flour, one tea-spoonful of baking powder. Flavor with lemon.

YELLOW SPICE CAKE.

THE same rule, substituting yelks for the whites and spices for the lemon. Use one tea-spoonful of cinnamon and one-half tea-spoonful each of nutmeg and cloves. For a chocolate cake stir in one and a half square of Baker's chocolate melted.

A. E. F.

FRUIT SPICE CAKE.

ONE and two-thirds cup of molasses, one cup of shortening, one cup of sugar one whole egg and the yelks of three, one cup of sour milk, one tea-spoonful each of allspice and nutmeg, four cups of sifted flour, one tea-spoonful of soda. Add as much or as little fruit as you like. Flavor with lemon. Two large loaves.

MRS. G. C. MINOE.

CARAMEL FROSTING.

TWO CUPS of sugar, two-thirds of a cup of sweet milk, butter half the size of an egg. Boil together in a double dish for 15 minutes. After taking from the fire stir until it grains. If too hard to spread, warm it a little. Flavor with vanilla. Use on plain cake. D. H. B. C.

TABLE TALK advises keeping out of the frying-pan and trusting to the broiler.

Entered at the Post-office at New York City, N. Y. as second class mail matter.

OUR markets and news departments have been crowded out of the paper this week by a volume of advertising received too late to be used on the cover. The storm of the past week has greatly interfered with the New York markets, and there is little to report in the way of changes. Poultry is plenty, eggs are going up in price, grain is a little firmer, butter steady with large receipts, fruits in good demand. Cattle and sheep hold their prices well while hogs are barely steady. The storm has seriously injured grapes and other fruits near New York. Potatoes are being pushed to market. The price promises to be higher later in the season.

He Wants Results.

"I will not accept your bodiless theories," exclaims the materialist "I require something tangible; if you make an assertion then support it with acceptable evidence." Very well, then; how is this for evidence?

Here are names you may find on the back of our notes of Compound Oxygen at any time:

Hon. Wm. D. Kelly, member of Congress, Philadelphia.
Rev. Victor L. Conrad, Editor Lutheran Observer, Philadelphia.
Rev. Charles W. Cushing, D. D., Rochester, N. Y.
Hon. William Penn Nixon, Editor Inter-Ocean, Chicago, Ill.
W. H. Worthington, Editor New South, Birmingham, Ala.
Judge H. P. Vrooman, Quenemo, Kan.
Mrs. Mary A. Livermore, Melrose, Mass.
Judge R. S. Voorhees, New York City.
Mr. E. C. Knight, Philadelphia.
Hon. W. W. Schuyler, Easton, Pa.
Mr. Frank Siddall, Merchant, Philadelphia.
Edward L. Wilson, 833 Broadway, N. Y., Editor Philadelphia Photographer.
Fidelia M. Lyon, Waimea, Hawaii, Sandwich Islands.
Alexander Ritchee, Inverness, Scotland.
Mrs. Manuel V. Ortega, Fresnillo, Vacatecas, Mex.
Mrs. Emma Cooper, Utilla, Spanish Honduras, Central America.
J. Cobb, Cassablanca, Morocco.
M. V. Ashbrook, Red Bluff, Cal.
Jacob Ward, Bowral, New South Wales.
And thousands of others in every part of the world.

We publish a brochure regarding the effect of Compound Oxygen on invalids suffering from consumption, asthma, bronchitis, dyspepsia, catarrh, hay fever, headache, debility, rheumatism, neuralgia; all chronic and nervous disorders. It will be sent free of charge to any one addressing DRS. STARKEY & PALEN, 1529 Arch St., Philadelphia, Pa.; 120 Sutter Street, San Francisco, Cal.—*Adv.*

YORK CHEMICAL WORKS, York, Pa.

REGULAR PREMIUM LIST.

LAST year the RURAL NEW-YORKER adopted a new Premium plan. A few standard articles known to be first-class in all respects were described and illustrated, while rates were given to show how easily agents could obtain them. It was intended that these articles should simply serve as representatives, giving an idea of the rates that would be offered on other articles not named in the printed list. This plan worked so well that it is proposed to continue it this year. We, therefore, give rates on a few articles, and announce our willingness to give similar terms on

ANY AMERICAN ARTICLE.

THE RURAL NEW-YORKER goes to a class of practical, business people who do not care for the cheap "novelties" so generally offered as premiums by farm papers. We find that our readers know what they want in the way of tools or household articles. It is never necessary for us to select premiums for them. It is our business to make such terms that the reader or agent will find a paying business in making up a club of subscribers. And this is just exactly what the **Rural New-Yorker** can do—to better advantage, perhaps, than any other farm journal in the land.

REMEMBER THAT WE WILL SUPPLY ANYTHING; IT MAKES NO DIFFERENCE WHAT IT MAY BE.

The few articles that are described in the following pages are standard. There is nothing cheap or shoddy there. We prefer to handle reliable goods made by responsible parties. The **Rural New-Yorker**

NEVER SELLS THESE ARTICLES,

And does not care to make anything from handling them. We are simply in the market for new subscribers. If you can obtain these subscribers you can have all the profit other papers would make on the articles.

Special Clubbing Combinations

Are also offered in connection with the **Rural New-Yorker.** It will pay all who desire to take more than one paper to secure our terms before ordering. As in years past, our clubbing specialties will be the **Rural New-Yorker** in connection with either of the following weekly papers:

CHICAGO INTER-OCEAN, NEW YORK WORLD, DETROIT FREE PRESS

We can also give the lowest possible clubbing rates on the **Rural New-Yorker** combined with any other paper or collection of papers.

NOTES.

☞ The price of the **Rural New-Yorker** from now until January 1, 1891, is $2.00 for single subscriptions. Club rates and agents' commissions made known on application.

☞ We make a very liberal short-term offer.

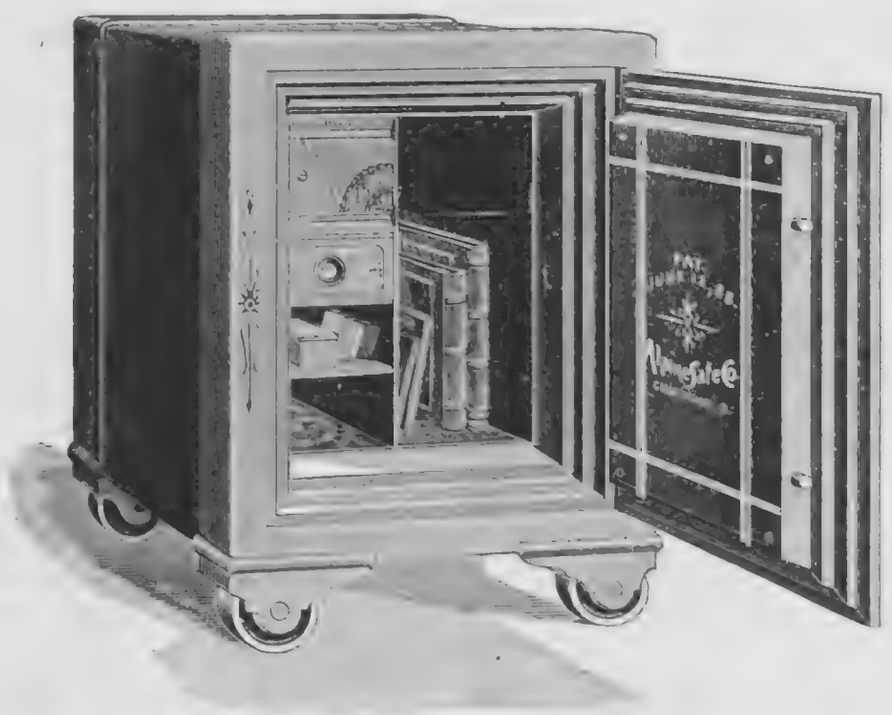
☞ Send for sample copies, posters, circulars, etc., etc.

☞ We will pay the highest wages for reliable agents.

☞ Money sent by letter generally reaches us safely. Still, unless registered, we will not assume any risks.

☞ Premiums are sent at the expense of the agent, unless otherwise noted, either by mail or express as desired. When goods are to be sent by mail, money for postage must accompany the order.

The Alpine Safe.
Given for 30 Subscribers.



THIS is a fire-proof safe with non-pickable combination locks. This is a first-rate premium for a store-keeper or agent who can take subscriptions in connection with his regular business and thus obtain a good safe at little or no cost. Any farmer who keeps valuable papers or securities at home will find this safe very useful. It is well in these days to be prepared for thieves or tramps. Such gentry will be baffled by one of these safes, which will hold your property as securely as though it were deposited in the county bank. The safe we offer is, outside measure, 28 inches high, 18 inches wide and 18 inches deep. It weighs 500 pounds, is well made and is a highly ornamental piece of furniture. Made by the Alpine Safe Co., Cincinnati, Ohio.

Cream Tester and Test Churn Combined.
Given for One New Subscription, Postage Paid.

THIS is a tool that every dairyman should have. We have offered it before so that our readers know what it is. It is simple enough to suit anybody; it is accurate enough to save you a great many dollars during the course of the year. How? It will enable you to pick out your best cows, because it will show you how one cow in your herd compares with another. Very likely you have been feeding good hay and grain to cows that are unable to make suitable returns. Stop such business. Discharge the poor cows. This tester is the detective that will establish their crime beyond a doubt. *For only one subscriber.* Made by Wyman L. Edson, Union Center, N. Y.

Success in Market Gardening.
Given for One New Subscriber.

This book is written by one of the largest and most successful market gardeners in the country, Mr. W. W. Rawson, of Boston, Mass. It is a book every one of our readers should have.

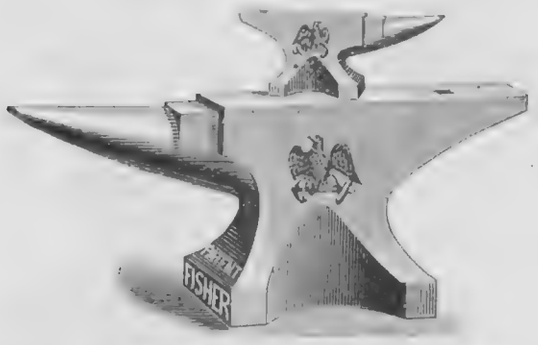
Webster's [Practical] Dictionary.
Given for One New Subscriber.

This is a complete little library in itself. It is of handy size and shape, and it contains just the words needed in every-day conversation or reading. Every child in the country ought to have one of these little dictionaries as a part of its school-book outfit. A teacher can do no kinder act for his pupils than to encourage them in the habit of consulting a dictionary whenever they have the least doubt as to the proper spelling or real meaning of a word met with in conversation or reading. This habit may be considered as being the most important part of the foundation of a thorough education. This little dictionary will lead to a thoroughness and carefulness that will be felt all through life. As will be noticed in another column, we offer Webster's Unabridged Dictionary at a rate that should make it very easy for school districts to supply their schools with this invaluable volume

Enterprise Sausage Stuffer and Lard Press.
Given for Three Subscribers.

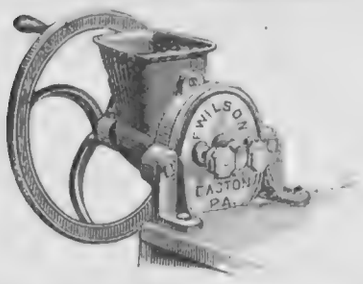
THIS is a machine which should be in every farmer's family. Send to the Enterprise Manufacturing Company, Philadelphia, Pa., for further particulars.

The "Eagle" Anvil.
Given for 10 Subscribers.



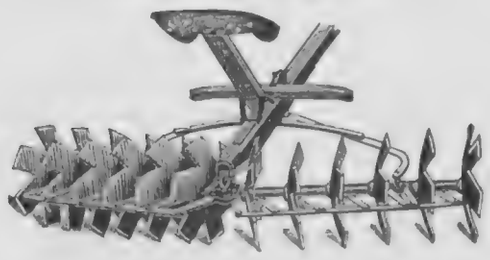
THIS is described as "something for farmers to hammer on," and there is no doubt about its ability to stand a vast amount of pounding. We believe this the best anvil made. It will prove a splendid addition to the farm work-shop. You can't get a better one. Made by Fisher & Morris, Trenton, N. J.

Frank Wilson Bone Mill.
Given for Six Subscribers.



JUDGING from the way our agents call for this premium, it looks as though we shall have to offer it as long as we do business. We never heard of one that did not prove very satisfactory. We never heard of a poultry man who once began to grind bones and shells who ever gave up the practice. Have you a mill? You ought to have one. Here is your chance to get one. The mill is made by Wilson Bros., Easton, Pa.

Clark's Cutaway Harrow and Seeder.
Given for 25 Subscribers.



DURING the past season the R. N.-Y. has given this implement a very careful test on different kinds of soil. We regard it as a very valuable labor-saving device. We shall use it in seeding our potato ground this fall, without using the plow at all. This, we find, is quite a common practice with those who use a Cutaway. The seeding attachment works very well indeed—in fact, this implement "saves work" as few others do. For 25 subscribers, it is a great bargain. Made by the Higganum Manufacturing Co., New York.

Lewis Combination Force-Pump.
Given for Five Subscribers.

THIS pump can be used as a fire-extinguisher, an insect exterminator or as a veterinary syringe. The R. N.-Y. has used it for the two latter purposes; fortunately we have had no occasion to extinguish any serious fire. This pump is very well suited to the use of those who desire to spray a few fruit trees with the arsenical mixtures, because it is light and easily handled and worked. At the same time it is powerful enough to do the necessary work. It is next to impossible in these days to produce perfect fruit without making use of spraying appliances. That is why the R. N.-Y. wants its readers to provide themselves with pumps. The Lewis pump is made by P. C. Lewis, Catskill, N. Y.

Carter's Hand Printer.
Given for Three Subscribers.

THIS is a self-gauging printer that does the work as well as any. It is used by having the butter rolled up and pressing the print through it, the surplus butter going out at a small hole at the side.

There is a very large class of customers who demand printed butter. As they are prepared to pay for the printing, it is policy for the good dairyman to select the tools that will serve his purpose best in this part of dairying. The printer we offer is made by John S. Carter, Syracuse, N. Y.

O. K. Churn.
Given for Nine Subscribers.

THIS is a barrel churn, working end over end, bringing the butter by concussion. This is the true principle of butter-making, as by this method it is easier to be sure that the butter comes in true granular form. The "O. K." is made of heavy white-oak staves, and is put together in the most substantial manner. The castings are made of malleable iron, tinned, and are thus strong and neat and will not rust or stain. The fact of the matter is that the "O. K." is one of the strongest and simplest churns on the market. It will make just as much and just as good butter as any churn on the market, and at the terms on which we offer it, it is a splendid bargain. The churn we offer is No. 2, capacity 15 gallons, price $9.00. We can furnish any other size on the same terms, viz., one dollar in retail value of the churn for each subscription. Made by John S. Carter, Syracuse, N. Y.

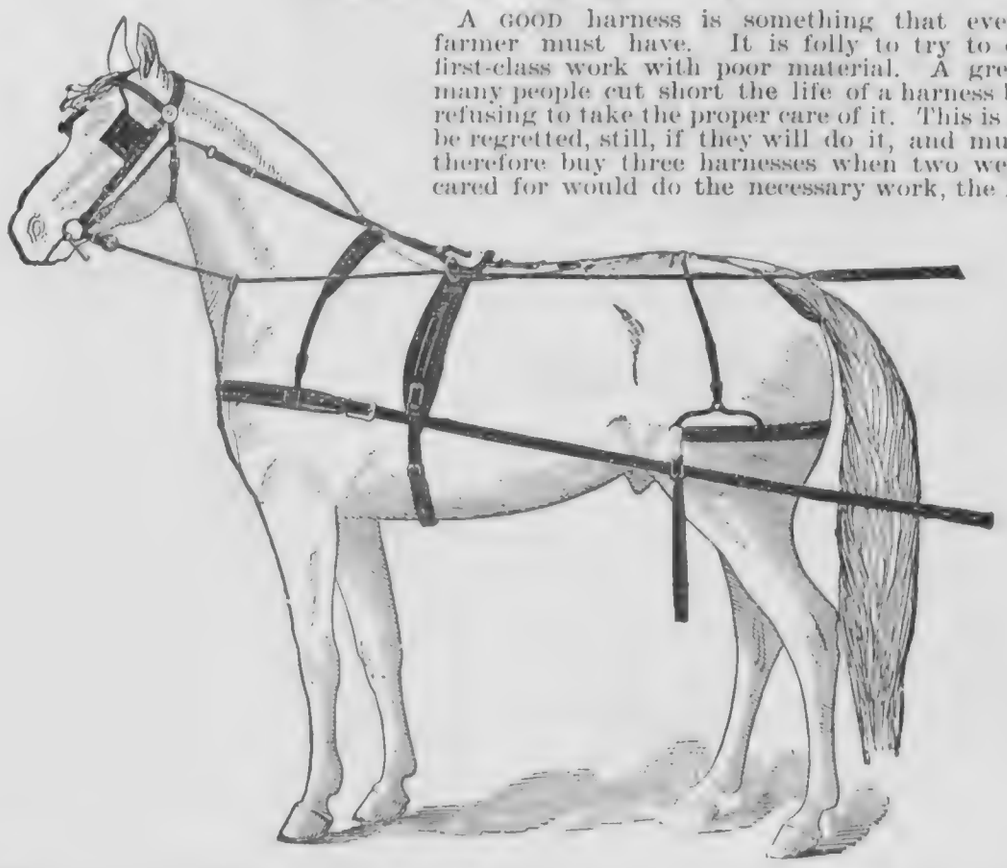
Sand's Patent Triple Motion White Mountain Freezer.
Given for Two Subscribers.

THE writer was taught when a boy to believe two things about ice-cream. 1. It was very unhealthy food. 2. It was far too expensive for ordinary people. These statements were believed until the writer grew up and had to do with a farm of his own. He now knows there is a good deal of nonsense about them. The same elements that make up the ice-cream are eaten every day in the year in other foods. Almost every dairyman nowadays has his own ice, and he can spare a little milk and cream now and then. In fact, the R. N.-Y. believes that the dairyman who does not provide ice-cream for his family, at least once a week, does not live up to his privileges. The R. N.-Y. has tried about every kind of freezer made, but has never found anything to equal the "White Mountain." It is a perfect implement. There should be one in your family and you never will have a better chance to put one there. *Only two subscribers!* The White Mountain Freezer Co., Nashua, N. H.

Montour Range.
Given for Thirty-Eight Subscribers.

WE want the attention of all housewives who are trying to do good kitchen work with an old, broken-down stove. You are wasting force, wasting fuel and wasting health. With a Montour Range your kitchen will seem like a new place. To the husband, father or sweetheart of the above-mentioned lady we may offer a little free advice: You, sir, will never fully realize what life is capable of producing until you bestir yourself, secure the necessary club of subscribers and present this premium to your lady. The Montour is one of the best ranges made. It is fitted with either wood, hard or soft coal grates. It economizes fuel, and is very handsome. Made by the Danville Stove and Manufacturing Co., Danville, Pa.

The Murray Harness.
Given for 18 Subscribers.

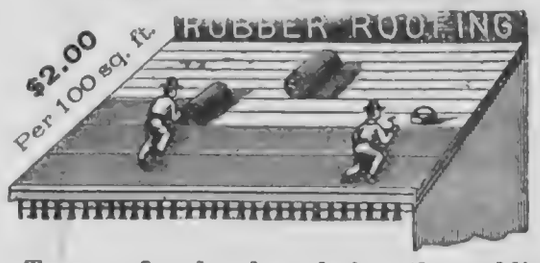


A GOOD harness is something that every farmer must have. It is folly to try to do first-class work with poor material. A great many people cut short the life of a harness by refusing to take the proper care of it. This is to be regretted, still, if they will do it, and must therefore buy three harnesses when two well-cared for would do the necessary work, the R. N.-Y. would like to save them all it can by providing a good harness at cheap rates. The "Murray" harness is a good one, well-made, strong and handsome. For 18 subscribers it is a first-rate premium. We can offer a cheaper harness made by the same house, for fewer subscribers, but this one we believe to be cheaper in the end. We can also quote figures on double harness, saddles and other horse furnishings. These articles are made by the Wilbur H. Murray Manufacturing Co., Cincinnati, Ohio.

The Perfection Coaster
Given for Four Subscribers.

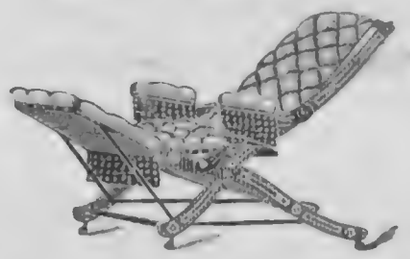
THE great value of this coaster lies in its perfect steering device, which is so easily managed that a boy or girl may safely coast on a steep hillside. Country children who live in sections where hills are found, know the keen pleasure of a good coast. The sleds commonly used are unsatisfactory. The only way to steer them is to drag one foot behind. This wears out the boot and forces a very uncomfortable position. The "Perfection" Coaster is steered by means of a lever. It attains the highest possible speed and is perfectly safe. This coaster is better than a toboggan because it can be used on any hill-side, while the toboggan requires a special track. All the Rural boys and girls both old and young will want one of these coasters. Made by S. L. Allen & Company, Philadelphia, Pa.

Rubber Roofing Outfit.
Given for Eight Subscribers



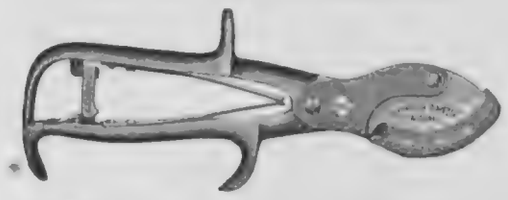
THIS roofing has been before the public for years. Many of our friends have used it and find it an excellent substitute for shingles or slate. We are sure there is a space of roof on your premises that needs just this covering. The outfit we offer consists of 325 square feet of the roofing with the necessary nails, caps and paint. Made by the Indiana Paint and Roofing Company, New York.

Luburg Adjustable Chair.
Given for 13 Subscribers.



THE R. N.-Y. has offered this chair as a premium almost every year it has made up a premium list. As each succeeding year finds more and more agents working to secure it, we reasonably conclude that it is one of the most attractive premiums that we can offer. The R. N.-Y. would like to have each one of its subscribers secure one of these chairs. This would make a very satisfactory showing on our subscription list, and would add greatly to the comfort and contentment of our subscribers. The R. N.-Y. uses this chair every day in the year, and can most heartily recommend it to all who desire a comfortable reclining place. Made by the Luburg Manufacturing Company, Philadelphia, Pa.

Pruning Shears,
Given For One New Subscription.



EVERY person who undertakes to grow fruit will want a pair of these shears. You can go to the store and pay $1.00 for a pair or you can get your neighbor to take the RURAL and thus get a pair for nothing. These shears are like the RURAL—"all right!" They are made by Seymour Smith & Son, Oakville, Conn.

Moody System of Dress-making.
Given for One Subscriber.

Our lady readers will be greatly interested in this premium. It consists of an illustrated system of dress-cutting and a book on dress-making by Prof. D. W. Moody. Experts speak in the highest terms of this system and all who appreciate well-fitting clothes will thank us for supplying this premium at such a reasonable rate. Sent for one subscription, postage paid.

Eclipse Vine and Plant Sprinkler.
Given For Three Subscribers.

This is considered the best device on the market for sprinkling potato vines with a water mixture of Paris-green. It has a sifter attachment so that plaster or ashes can be used if desired. This ought to make a first-rate premium, considering the fact that farmers have more and more trouble each year in fighting insects. This is a very useful premium. It is made by F. A. Tyler, Rome, N. Y.

Farm and Family Scales.

THE farmer who undertakes to do business without a pair of scales works at a sad disadvantage. The science of successful marketing is based upon accurate weighing. The calculating farmer uses the scales. He weighs his milk and thus detects his robber cows with the aid of a cream tester. He weighs small quantities of his fertilizers and weighs the crops that come from them. When he sells an article by weight he weighs it before it goes to market. He works on business principles—the result is success. The careless farmer "guesses" at weights, results and quantities. The R. N.-Y. is so well convinced of the great importance of scales on the farm that it has made special arrangments to supply the celebrated Jones scales as premiums. They are made of all sizes. We call special attention to the following sizes:

PLATFORM BARN SCALES.—The large cut shows the shape. It will weigh from four ounces to 400 pounds. It is well made and reliable in every way. We offer this for 20 subscribers.

"RURAL NEW-YORKER" SCALES.—These scales weigh from one-fourth of an ounce to 25 pounds. Nothing could be nicer for weighing milk or similar products. Every one has the name, "RURAL NEW-YORKER" stamped upon it. Given for three subscribers.

Universal or Family Scales

THE R. N.-Y. has used a pair of these scales for many years. They are used in making the weighings for our experiments and are always reliable. They weigh from one-half an ounce to 240 pounds. Given for six subscribers. These scales aremade by Jones of Binghamton, and *"he pays the freight!"*

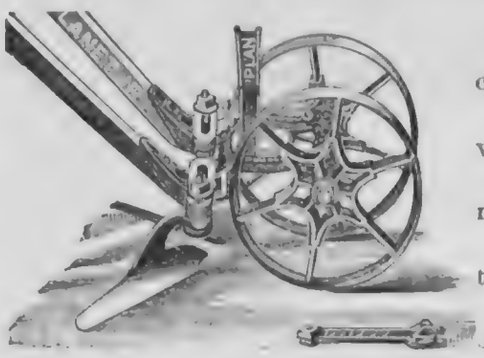
"Grand Rapids" Carpet Sweeper.

Given for Three Subscribers.

THE Grand Rapids Sweeper possesses all the qualities of a broom and dust-pan combined, its brush being so constructed as to be perfectly self-adjusting under the slightest pressure. Lightly running, it will take up anything that a broom will, from any kind of carpet, while if pressure be given to it as with a broom, to remove dirt embedded in the carpet—still running easily—it will work wonders, being more effective than any broom. It is adapted for the lightest as well as the heaviest sweepings. Recently improved with new reversible bail and spring dump for discharging the dirt, and everlasting, pure bristle brush, it is more effective than ever. Its case is unique in shape, made of rich woods and handsomely hand-decorated, which, with the contrast afforded by the color of the rubber band encircling it, makes it the handsomest as well as the best of carpet sweepers. It sells for $3, and is manufactured by the Bissell Carpet Sweeper Company, Grand Rapids, Mich. Eastern branch, 103 Chambers street, New York.

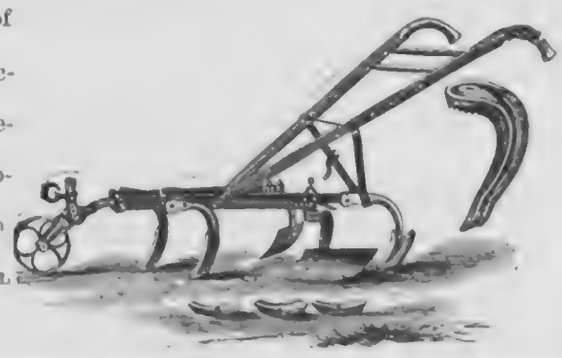
"Planet Jr." Tools.

If there are any farmers who need to be told what these tools are, we can only say that we feel sorry for them. They are behind the times. We offer two of the tools this year, though we can supply, if necessary, any implement made by the "Planet Jr." Company.



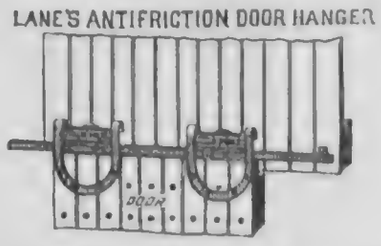
THE PLAIN DOUBLE WHEEL HOE may be seen in the cut. It is a strong yet light implement, made of the very best materials, and with all the latest improvements. You know what it is. It is only a question as to whether you want it or not. It costs $4.50. We offer it for five subscribers.

"PLANET JR." HORSE HOE.—This is the best of the cultivators. It is light, strong and effective in every way. Why use the old horse-killing tools when this one is so easily obtainable? Price, $11. Given for eleven subscribers. All these tools are made by S. L. Allen & Co., Philadelphia, Pa.



Lane's Patent Door-Hanger.

Given for One Subscriber.

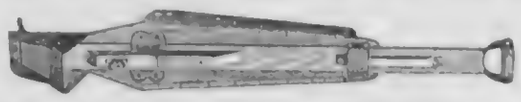


This is for the farmers who want an easy-running door on the barn. We consider this the best door hanger on the market. It runs without friction and does not screech and groan as rusty wheels generally do. The hangers are made in three sizes, to run five, 10 and 15 feet respectively. We offer No. 1. The hangers will run on any ordinary iron track, but if desired, a patent steel track can be supplied. The hangers are made by Lane Brothers, Poughkeepsie, N. Y.

Macomber's Corn Planter.

Given for Two Subscribers.

This is one of the greatest labor-saving machines of the age. It is slow, tedious, backaching work to drop corn by hand in the old-fashioned way. Thousands of these planters



have been sold, and the demand for them increases every year. They sell for $3.50, and are made by S. M. Macomber, Adams, Grand Isle Co., Vt.

Farm, School and Church Bells.

Given for Two, Eight and 25 Subscribers.

Everybody knows how useful a good farm bell is. It is worth its price to hear it give notice of a good meal. In case of fire or of a visitation from tramps the neighborhood can be easily alarmed by a brisk ringing of the bell. We will duplicate the offer of last year, viz., give a bell costing $5 for two subscribers. This bell weighs 50 pounds and is 17 inches in diameter.

Many of our friends, last year, desired larger bells. To accommodate them we have made arrangements to supply the bells, numbers 24 and 26, which are suitable for churches and schools. The No. 24 bell weighs 150 pounds or 225 pounds with mountings. It costs $25, but we are able to offer it for 20 subscribers. The No. 26 weighs 220 pounds or 325 pounds with mountings. It costs $40, but we can offer it for 25 subscribers. These bells are first class in every respect. They are made of an alloy of cast steel and crystal metal. They are of fine, clear tone, convey-

ing sound from three to four miles. They are warranted for two years. Think of the chance we offer school districts or church societies to provide themselves with these excellent bells! Twenty public-spirited men in any district or church society can form a club for the RURAL and thus secure a bell for the church or schoolhouse. Send to Bell & Co., Hillsboro, Ohio, for descriptive circular and catalogue.

Waterman's Ideal Fountain Pen.

Given for Two Subscribers.

A farmer or any one else who fails to use every labor saving device of merit makes a mistake. If you spend five minutes every day for a year getting out your inkstand and looking up your pen, you lose in a year, nearly three working days, to say nothing of loss in worry and ill nature over dry ink-stands and broken or rusted pen-points. The Ideal Fountain Pen is a labor-saving implement just as much as is a harvesting machine or a sulky plow, and every one who has writing to do should have one. It is a pen for every-day use at the desk, or can be carried in the pocket and used when occasion requires. It is a first-class gold pen attached to a hard-rubber pen-holder, carrying ink sufficient for from 12 to 16 hours' continuous writing. The entire pen is plainly shown in the cut. The handle or ink holder is made in two pieces, the point section and the barrel, which are secured together by a screw joint, at which place it is opened for filling with ink. The pen (a first-class gold pen) is held in the point section by the feed bar, which also carries the ink from the reservoir to the pen only so fast as used up in the writing. The fourth piece is merely a cap which covers the pen when not in use, to protect it from injury in the pocket, and also to prevent the ink from drying up, and when removed from over the pen, it is put on as shown in cut, to lengthen the holder for use in writing. We have used this pen for four years, and can fully recommend it to every one as the best pen we have ever seen. One year we handled hundreds, giving it as a premium for two subscribers. It is again offered for two subscriptions, and every one of our friends should secure one. We do not wish our readers to confound this with the cheap fountain pen, or with the old stylographic pen, as it is fully equal to any gold pen made, and is worth a basketful of the cheap, poor trash, and we guarantee it to fit to your hand, or you can change till you get one that does fit. This is a pen that every clerk, school teacher, canvasser or farmer needs. It is made by L. E. Waterman, No. 155 Broadway, N. Y. The prices range from $2.75 to $7. Send for circular as above, see what the pen is, and then go to work and secure one. We know you will never regret it.

The Nos. 1, 2, and 3, are most suitable for ladies' use; we will send either number for two subscribers. The No. 4 is the medium size and is well adapted for ordinary use. We will send one for two subscribers. The larger sizes, No. 5, 6 and 7, will be sent for three, four and five subscribers respectively. If you desire the pen sent by registered mail send 10c. for fee. Farmers, Clergymen, Boys, Girls, School-teachers, Everybody, here is a chance you cannot afford to neglect. No more useful or appropriate present can be found for Christmas, New Year's or birthday, and you can earn one with a little effort. Send to L. E. Waterman, 155 Broadway, N. Y., for circulars.

The Enterprise Meat Chopper.

Given for Three and Four Subscribers.

THIS is another article that we have offered for a number of years—always with very satisfactory results. It is a first-rate article, and we can safely repeat what was said last year concerning it:

A lady, who has achieved quite a reputation as a writer, recently said: "I shall always regret the years I spent trying to keep house without an Enterprise Chopper. It is an indispensable household utensil. No housekeeper who knows its value would be without it for many times the price asked for it." This is by no means an exceptional statement. During the past four years we have used a large number of these choppers as premiums and have yet to hear the first word of complaint against them. Tens of thousands of these choppers have been sold and are in use. They will last a lifetime. We want every housekeeper who reads the RURAL to have one. We would prefer to have you send us the required number of subscribers, but if you cannot do it conveniently, buy one of the nearest hardware dealer. The Enterprise cuts the meat like a pair of shears and does not mash or grind it. The meat is left in as good condition as when prepared with the old-style chopping knife and bowl. We would certainly never think of using any other chopper in our family.

The No. 10, shown in the cut, weighs eight pounds, chops two pounds per minute, and sells

for $3. The No 12 is the same as the No. 10, except that it has legs instead of clamps; price, $2.50. The No. 22 chops three pounds per minute; price, $4.00.

These choppers are made by the Enterprise M'f'g Co., Cor. Third and Dauphin Streets, Philadelphia, Pa.

BOOKS! BOOKS!

As in former years, the R. N.-Y. offers to furnish any book that is published or sold in America. Single books, sets of books or complete libraries will be furnished as desired. Our experience is that most of our agents have some special book in mind. Tell us what your favorite is and we will quote rates on it. Here are a few of our specialties. Similar rates can be obtained for other books.

Willard's Practical Dairy Husbandry.

THIS is still the standard work on dairying in spite of the volumes that have been published since it first appeared. This is a new edition with over 300 illustrations. Price $3.00, given for only three subscribers.

Willard's Practical Butter Book.

THIS is a complete treatise on butter-making on the farm and at factories. Price $1.00, given for one subscriber.

Randall's Practical Shepherd.

THIS is another standard old volume, very complete and reliable. It has been out of print for some years. Price $2.00, given for two subscribers.

Lewis's Practical Poultry Book.

THIS contains full information regarding breeds, breeding, rearing and general management of poultry. It also tells all about caponizing. Price $1.50, given for two subscribers.

How to Hunt and Trap.

IF it be possible for one to learn how to catch or kill wild animals without actual experience in the field, this book will provide the desired information. Price $1.50, given for two subscribers.

Andersonville Violets.

THIS story, published two years ago in the RURAL, has had a large sale in book form. Price $1.00, given for one subscriber.

Works of Charles Dickens.

WE can supply a complete set of Dickens in 15 volumes for only two subscribers. The merit of this set lies in its low price. The paper, printing and binding are not at all what we should expect in a high-priced set. The books can be read easily and with good care will wear well. This is a wonderful bargain at the price, but remember we do not say the books are printed or bound in the finest style of the art.

The Waverley Novels. A Complete Set of 25 Volumes for only two Subscribers.

THESE books are similar to the volumes of Dickens's works described above. All that was said of them can be said of the Waverley Novels.

Miss Alcott's Works.

THESE books cost $1 each. We will send any one of them for one subscription and 10 cents postage.

Uncle Tom's Cabin.

THIS work is always popular. We have more calls for it than for any other volume. Given for one subscription.

"Allegro."

THIS is called an "Italian Music Card Game." It is an instructive game, having for its object an awakening of interest in the study of note reading, the most important part of music. It is entertaining too and thus appeals to children. Given for one subscription. Made by the "Allegro" Card Company, Philadelphia, Pa.

Books That Have Helped Me."

THE star of empire is ever tending Westward. The marvelous growth of Kansas, Nebraska and Dakota, the development of Colorado, Wyoming, Montana, Idaho and the great mineral region between the "Rockies" and the Pacific Coast with its varied climate and productions, afford ample room for millions of industrious people. Circulars and pamphlets gotten up by land speculators, town lot syndicates and railroads are often misleading. If you want reliable information about the great West, you must get it through reputable and responsible papers. Such you will find the Omaha Bee, now in its nineteenth year. Sample copies mailed free. Direct letter or postal card: THE WEEKLY BEE, Omaha, Nebraska.—*Adv.*

Humorous.

The RURAL NEW-YORKER *is prepared to offer very liberal terms to good, responsible* PERMANENT *agents. Correspondence solicited.*

A POULTRY authority says that "chickens should have an ample range." It depends upon the number of chickens. A little chicken will broil pretty well over a very small stove.—*New York Herald.*

"I WOULD like to ask you a question," said a gentleman to a fellow who was spreading himself over four seats in a crowded railway car. "What is it?" "What brand of nerve food do you use?"—*Epoch.*

JACK: "Charley, why don't you propose to the Widow Green's daughter? She's rich and is regarded as the pearl of her sex." Charley: "I know it, my boy, but I dislike the mother of Pearl."—*Jeweler's Weekly.*

MISS PLANTAGANET DE VERE: "That man's attentions to me are most offensive, and he has the reputation of being a fortune hunter. Do you suppose it is papa's wealth that allures him?" Miss Dolly Flicker (thoughtfully): "Why what else *can* it be?"—*Life.*

FIVE HARVEST EXCURSIONS.

THE Burlington Route, C., B. & Q. R. R., will sell, on Tuesday, August 6th and 20th, September 10th and 24th, and October 8th, Harvest Excursion Tickets at *Half Rates* to points in the Farming Regions of the West, Southwest and Northwest. Limit 30 days. For circular giving details concerning Tickets, rates, time of trains, etc., and for descriptive land folder, call on your ticket agent, or address P. S. EUSTIS, Gen'l Pass. and Ticket Agent, Chicago, Ill.—*Adv.*

Miscellaneous Advertising.

DR SETH ARNOLD'S COUGH KILLER CURES COUGHS AND COLDS. PREVENTS CONSUMPTION.

I WAS GIVEN UP to die with consumption by a prominent physician. Was advised by friends to try Seth Arnold's Cough Killer, and much to the astonishment of all it cured me and I am now a well, hearty man. Thomas D. Paine, Jeweler, Woonsocket, R. I. **25c., 50c. and $1 per bottle.** **ALL DEALERS SELL IT.**

AN ELECANT COUNTRY HOME FOR SALE AT A BARGAIN.

Located within an hour's ride of New York City. House has 10 rooms with all improvements: barn 34x20. Two acres of land. Great variety of small fruit, shrubs, etc. Fine location for greenhouses. Price, only $4,500. Terms easy. *Must be sold.* J. H GRIFFITH, Care Rural New-Yorker, N. Y. City.

INDIANA PAINT AND ROOFING CO., NEW YORK.

QUEEN BEAVER

WITH PATENT HEATING ATTACHMENT.

Wonderful things can be said of man's handiwork within the last half century. The Locomotive has taken the place of the Horse, the Reaper succeeds the Sickle, and the Flail makes way for the Threshing Machine. The ocean "Grey Hounds"—giants in strength and palaces of luxury and comfort—cross from the New to the Old World within the secular days Thoughts are flashed from Continent to Continent, distancing the Sun in his flight, and Edison now says the time is not far distant when a whisper may be heard around the world.

But it is not our purpose to write a dissertation upon this subject. Instead, we wish to call the attention of all good people to an attachment used upon our ranges. While this device cannot take rank among the marvelous, yet it is of wonderful utility and economy. By it we utilize the heat of oven, when not wanted for cooking, to heat upper or adjoining rooms. The arrangement suggests economy.

The cut shows heat pipe leading from the heating attachment, affixed to back of oven of one of our ranges the "Queen Beaver." In the bottom of oven door there is placed a draft slide, through which air is admitted into the oven. Becoming heated, it is passed through an opening in the upper part of back of oven, through an elbow, in which there is an ingeniously devised check damper, into pipe, and then conveyed into upper rooms.

This range has large oven, pedal oven door, opener, Duplex grate, and, in fact, every modern appliance and is made in such a variety of styles and sizes, as to meet the wants of all.

Our line of stoves embraces everything that may be desired in Wood and Coal Cooks, Ranges and Heaters. Our Parlor Heaters are beautiful conceptions.

THE DANVILLE STOVE & M'F'G CO.,
CHICAGO: 120, 122 & 124 So. Clinton Street. DANVILLE, PA.

The TORNADO Feed, Ensilage and Stalk Cutter

AND SLITTER for cutting hay, straw, sheaf oats and cornstalks. The latest and best. For cutting ENSILAGE, it has no equal. It SPLITS and CUTS cornstalks (with or without the ear), at one and the same operation, leaving no sharp corners or edges on the cut pieces to cause sore gums in the mouths of the cattle.

Leading Points of Excellence in the Tornado: Speed, capacity, strength, durability, ease of management, new safety fly-wheel, novel cutting device, improved knife blades, simplicity of construction, positive self-acting feed rollers, independent adjustable and reversible cutter bar, patent automatic stripper bar to prevent choking.

TRUTH CRUSHED TO EARTH WILL RISE AGAIN!!!

Probably your dealer or some agent for cheap, shoddy buggies and harness has told you that "he has as good or better buggies and harness than the "Murray," which he will sell you for $15 or $20 more, and will last you longer, and when he tells you this, he knows

HE LIES!

You wonder why he would tell you a downright lie. Why simply because we will not give him a big per cent. to sell our goods, but

SELL DIRECT TO YOU AND YOUR NEIGHBOR

just as cheap as we will him. Every body should know the

"MURRAY" BUGGIES AND HARNESS

are the best and cheapest in the market, and there is no getting around it. We know it too from the fact of our steadily increasing trade, and the excellent testimonials we are receiving every day from our patrons. Don't pay big prices to dealers, but buy direct from the manufacturers and save money.

FIGURES DON'T LIE! LOOK AT THESE.

BUGGIES!

If you value your money, don't buy elsewhere before seeing our Catalogue.

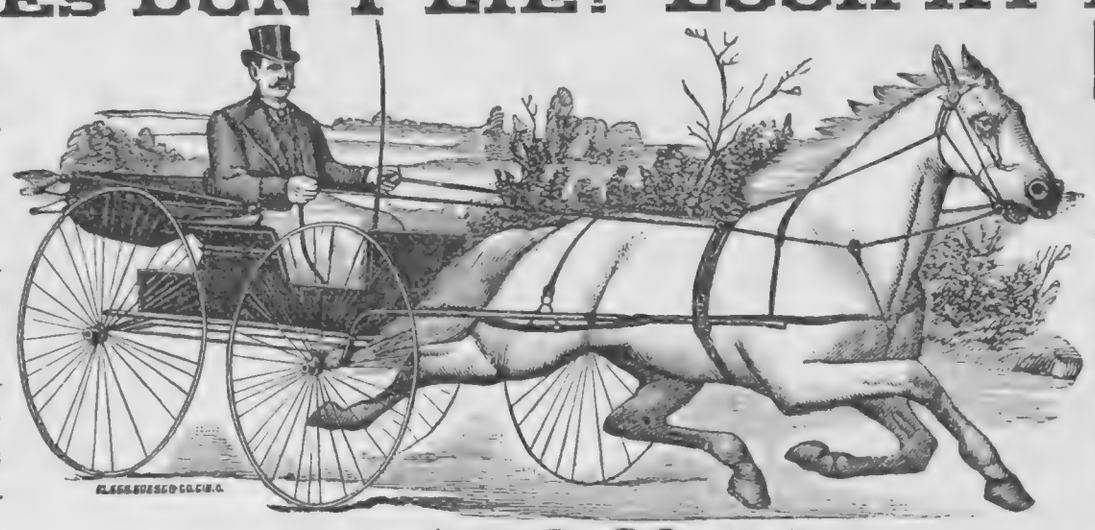
$15.00 for one of the best Road Carts made

$55.95 for either a Side Bar or End Spring Murray Buggy

$108.00 for our Murray Canopy Top Side Bar Surreys

$109.00 for our elegant Jump Seat Surrey

We're not afraid to show our prices, for we know they can't be beat.



!! $66.99 !!

We're the only Factory in the U. S. that CAN DO THIS!!!

Just think, sixty-six dollars and ninety cents for a "Murray" Brewster Side-Bar Top Buggy, and a set of "Murray" Single Strap Track Harness. It seems strange, but it's true, and we are the only Firm that can do it.

HARNESS!

If you want the Best and Cheapest, buy of us.

$5.95 for our No. 1 Murray Single Buggy Harness

$9.35 for our No. 2 Murray Single Buggy Harness

$10.95 for our No. 3 Murray Single Buggy Harness

$15.20 for our No. 4 Murray Double Buggy Harness

$19.80 for our No. 5 Murray Double Buggy Harness

Remember, that every harness that leaves our factory is made of the best No. 1 OAK TANNED LEATHER.

HONEST GOODS, LOW PRICES and **COURTEOUS TREATMENT TO OUR CUSTOMERS** is our motto.

We deal direct with the consumer. Call and see or write to us for our Catalogue and Price List.

The Herdsman.

A GROUP OF NEVADA CATTLE.

THE picture shown at Figure 246 is a copy of a photograph taken on the farm of Mr. Samuel Davis of Carson, Nevada. The big bull in the foreground is a Holstein—"Saratoga" 3,300, and the little girl is the eight-year-old daughter of Mr. Davis. The picture was made, originally, to illustrate the gentle character of these animals. We are very glad to print it, because many Eastern people seem to have an idea that the wild Texas steer is the true type of all Western cattle. The dairy animal is by nature a docile creature, and kind treatment of stock will give satisfactory results in any part of any country. We do not see that the "dehorner" has much of any business inside Mr. Davis's yard.

THE PAST HISTORY AND FUTURE PROSPECTS OF THE BEEF-PRODUCING INDUSTRY IN OHIO.

JUDGE T. C. JONES.

Beef cattle raising and marketing in Ohio over half a century ago; character of the farms; impecuniosity of the farmers; quality of the cattle; early drives to the Baltimore and Philadelphia markets, profits of the farmers; prices to stock-growers; mode of feeding; the great extent of the trade; railroad transportation supersedes driving; soil exhaustion.

THE writer has been familiar with the condition of the cattle-growing industry, and the general practice of the farmers engaged in it, in the rich valleys of this State for more than half a century. Indeed my recollection of the practice of cattle growers, and the quality of their stock in the Scioto Valley covers a period of more than three score years. In those early days our people were comparatively poor; they had very little capital except what was invested in their lands. In that portion of the State known as the Virginia Military District, embracing all the lands between the Scioto and the Miami Rivers, there were many large estates, holdings of 500 to 2,000 acres being quite common. In other districts the farms were generally small, averaging but little, if any, more than 100 acres each. But the occupiers of these small estates constituted then, as they do at this day, the great majority of our cattle-growers. Then, as now, every farmer must have a few cattle. The work ox was then almost as essentiai on every farm as the dairy cow, which has always been regarded as a necessity in every family.

The quality of our cattle, descended, as they were, from good animals imported from Europe, mostly from Great Britain, was pretty good. In breeding, attention was given to the maintenance of useful rather than fancy properties. The calves of the cows that were good milkers, and of good form, and thrifty feeders were generally reserved for breeding, while the offspring of the poor milkers and the "raw-boned" sort were drafted for slaughter. Attention was also given to the disposition of the breeding stock. The restless and the vicious were regarded as not only dangerous but unprofitable. But the great defect in the character of Ohio stock in the first third of the present century was the absence of uniformity in essential characteristics. No attention was given to breeding for uniformity of type, and the ancestors of our stock being imported for the most part before systematic improvement in breeding had been established in Europe, we had no cattle that were thoroughbred, none, that is, that had been bred to a uniform type in useful properties. Our cattle were of all colors—red, black, brindle, spotted (pied), line-backed, etc. Some had long horns, but the great majority were middle-horned, while the hornless sorts were not uncommon, though we had no polled breed, nor was it supposed in those days of practical experience that the absence of horns was any special advantage.

In the early history of our agriculture the great want of the inhabitants was money. The farmer could not realize cash for his products, because they could not be sent to market. As early as the year 1805, George Renick, of Chilicothe, started a lot of 68 head of fat cattle for the Baltimore market, driving them by way of Moorfield, Hardy County, Virginia, where 21 of them were sold for $20.95 per head; one was given to Mr. Renick's father, then living near Moorfield, and the remaining 46 head were sold at Baltimore, the profit on them, after deducting all expenses, being $31.77 per head.

Mr. Harness Renick from whom I have this account, states that there is no entry in his father's books showing the first cost of these cattle; but they were doubtless good in quality for the period, and fully ripe in condition. Mr. George Renick who, besides being a large land holder, was engaged in the mercantile business of Chilicothe, was the first to conceive the idea of sending to the cash markets of the Atlantic the products of the rich soil of the Scioto Valley by this method, the profits of which were highly satisfactory during all the years of the early history of our agriculture. But the prices realized to the breeders of these cattle were generally very low, as shown by the following furnished by Mr. Harness Renick from his father's book:

1818,—76 head of cattle were purchased at an average price of $20.75 per head. Twenty-six head on hand put down as worth $25 each.

1822,—325 head, net cost $15.45 per head—90 of these were Kentucky stock, which cost, including expenses, $9.71 per head.

1823,—300 head, cost per head $12.75.

1824,—303 head, cost per head $9.40.

1825,—212 head, cost per head $13.68. Twenty-seven of these were bought of Governor Worthington.

These cattle were well matured, generally from four to five years old. The sales at Baltimore and Philadelphia during these years show a profit of from $19.95 per head, clear of expenses, to $31.91.

Beef cattle were somewhat higher in 1828 to 1830; but prices continued low until the great expansion in the currency caused by the large issues of the State Banks in 1836. This expansion of the currency was followed by a general suspension of specie payments in 1837. This derangement in the currency with changes in duties on foreign imports, caused the most severe depression in prices of agricultural products ever experienced in our history. Still the method of marketing our crops by driving fat cattle to market, "with hogs to follow," inaugurated by George Renick in 1805, continued until superseded by the railway transportation in 1850 to 1852. During the last 10 or 12 years of its existence the volume of this business was enormous. In our rich valleys corn was the great staple crop, and excepting the limited amount consumed by

A GROUP OF NEVADA CATTLE. From an Indistinct Photograph. Fig. 246.

the distilleries, the important consumers were the feeders of hogs and cattle. I remember making inquiry in regard to the number of cattle fed in a single year in the county of Pickaway, and was surprised to find that it amounted to no less than 14,000 head. The bullocks probably averaged from 1,400 to 1,500 pounds per head, and were fed in lots of 100 bullocks with,say,200 light hogs to follow.

The method was to arrange two feed lots in a dry, sheltered locality, with a proper and convenient supply of water. The corn was hauled from the shock on a low wagon with a long rack by two yokes of oxen. The pigs meantime occupied the other lot, from which they would be removed before a fresh load would be distributed. By this method it is believed that very little corn was wasted. The undigested grain was picked up by the hogs and found to be more readily assimilated by them than the dry corn. The quality of the beef produced under this system was excellent; being fully matured and fat, it was rich in juices and of superior flavor. But in one sense the practice was expensive. The cattle were well grazed and were allowed from 75 to 100 bushels of corn each with the fodder during the last season's feeding, say, from October to March or April, having been "half fed;" that is, consuming 40 to 50 bushels of corn each the previous winter. This was the method in the corn-growing valleys, to which the cattle were driven from the grazing districts in this State and from Kentucky, and, after 1830, to some extent from Illinois.

Soon after the construction of railways the price of grain advanced, and farmers began to grow more wheat and to devote less land to corn and grass, until at this date even on our richest lands, as compared with the old practice, but a small moiety of the crops are fed out on the farm. The opulent proprietors of many of the large estates in our corn-producing districts are in the habit of leasing their lands to tenants for one half the crop of grain to be delivered at the warehouses at the neighboring stations on the railway or the canal. To compensate for this enormous drain upon the fertility of the soil some farmers are expending large sums of money for commercial fertilizers, in the vain hope that the infinitesimal doses will compensate for the wholesale removal they are annually making of grain and hay, and straw, etc., etc.

Delaware County, Ohio.

(To be Continued.)

HOLSTEIN BULL VERNON.

THIS bull, whose picture is shown at Figure 247, is owned by our corespondent J. W. Ingham, of Pennsylvania. We have had considerable to say in times past about the peculiar merits of Holstein cattle. Mr. Ingham gives the following reasons for selecting this breed for his purpose:

"I desire cattle that have been bred especially for dairy purposes and which are large enough to furnish beef, when beef is desirable. These cattle are as thoroughbred as any stock in the world. They have been bred a thousand years for the dairy, and the breeders in aiming for the highest excellence in milk production, did not neglect size, and comeliness. If a cow is a machine for making milk out of grass, hay, bran, etc., then the larger machine is capable of performing the most work. A large engine requires more fuel and water to make steam than a small one, but it furnishes enough more power to pay for the extra fuel and water. In my opinion an average Holstein-Friesian cow will furnish as much butter as an average Jersey cow on the same amount of feed, and on a larger amount of feed will do still better."

Farm Topics.

The Dressed Beef Trade.

WHAT ARE YOU GOING TO DO ABOUT IT?

"1. *Has the trade in Chicago dressed beef made itself felt in the farming interests of your section?*

2. *To what extent has it affected the raising and fattening of beef cattle?*

3. *Has it changed the business of local butchers to any extent?*

4. *Is the change an advantage or disadvantage to farmers, and to what extent?*

5. *What can you suggest as a means of fairly regulating the matter?*"

HOLSTEIN BULL, VERNON. FIG. 247.

FROM M. H. C. GARDNER.

All farmers, especially those in the East, should be interested in the subject of refrigerator meat, or, more properly, Chicago dressed beef, obtained from Western cattle fattened on cheap ranges, at a cost that would be ruinous to an Eastern farmer, taken to the immense abattoirs and dressed, placed in refrigerator cars and shipped to the Eastern States by the railroad companies, which by reason of large contracts with the dressed beef men, charge a very low figure for freights. This meat comes to a building erected on purpose for the business on a switch in some town that is central to a large local territory, and is then distributed to the meat markets 10 to 20 miles around. This subject I say, is what has spread consternation, and made low prices rule for beef among the farmers of the East. A few years ago there were farmers who, in addition to their dairy business, fattened a few steers, perhaps two or three yoke of oxen during the fall and winter for early spring beef; but times have changed and the advent of Chicago beef precludes any possibility of fattening any meat for profit any more. Butchers in large places, like Middletown, used to scour the country for miles around for steer and good cow beef, veals, lambs, sheep, etc., and pay a fair price for them; but this is all changed. They will not now even look at, or even talk to you about a fat cow, for in a few minutes or hours at most, they can get direct from the refrigerator just such meat and as much of it as they want, and they prefer to do it because there is no profit in dressing a fat animal for the by-products, and tallow and hides rule in price very low.

A few months ago this very subject of Chicago beef came up and was discussed at our farmers' club—the Westtown Farm and Garden Club—and it made the farmers feel glum as they discussed it, and no radical remedy was suggested that could be available. Leg'slation was spoken of; but past experience shows that it is a hard matter to legislate against powerful corporations. They can get what favorable laws they want, for, as the late James Fisk of Erie Railroad notoriety, said, when he wanted a particular law or bill passed for the benefit of his road, he went up to Albany and bought it. This kind of legislation puts farmers in the back-ground; so the club seemed to think that there was no outlet or remedy and that we would have to "grin and bear it."

Farmers here sell milk exclusively and it is a serious question what to do with the stock that is turned off fat. It is considered a good sale to get $25 or $30 for a cow that perhaps was bought and proved to be a poor milker, for which $45 or $50 were paid perhaps a year or two before. The country butcher will drive up to the farmer's door on his semi-weekly trips with Chicago beef in his wagon, which we must buy or go without beef altogether, and in the meantime we may have one or two fat cows to dispose of. He may perhaps buy one, now and then, but at a ruinously low figure. So I must candidly admit that I cannot see a very brilliant future for the dairy farmer in the way of getting rid of his fat stock at a paying figure.

Orange County, N. Y.

FROM F. E. VAN EPS.

1. It has. The change is manifested in the low price of fat cattle.

2. Very few beef cattle are being raised in this section. Many who were in the habit of buying cattle in the fall and winter to feed for beef have given it up entirely, the price of fat cattle being so low as not to pay the cost of feed.

3. No; except to lessen their work and increase their profits.

4. A disadvantage. Many are keeping cows and furnishing cream for the creamery; others cannot do this, not having summer feed, and they are therefore at a loss how to make the manure that is needed on the farm.

5. I give it up.

Ontario Co., N. Y.

FROM J. H. PORTER.

The trade in Chicago dressed beef has hurt the farming interest here to some extent, as it has made less demand for home-grown beef. For the past few years it has been more profitable to sell calves in the fall. All the good steer calves have been bought up and shipped to Chicago and from there they go out on the plains—some as far as Colorado. Some farmers here go to Buffalo and buy a carload apiece of steers in the fall, feed them through the winter and take them back and sell them in the spring, but it hasn't paid for the last few years; sometimes they have to sell them at about the same price they paid for them.

3. It has changed the business of butchers to some extent. They used to come out through the country and buy up all the cattle; now they scarcely come at all.

4. The change is a decided disadvantage to the small farmer who has but a few fat cattle to sell.

5. I don't know how the business can be regulated unless a tax can be imposed on all beef brought into the State or unless a stop can be put to the importation of any dressed beef at all.

North East, Pa.

FROM W. B. PRATT.

Western dressed beef is rarely seen in small inland village markets, but its free use in larger places along railroad lines makes it govern the price of home-grown animals. There are fewer buyers searching through inland districts for supplies for local markets than formerly, and the interest felt in growing and feeding cattle is much smaller. Consumers doubtless get cheaper beef, and in that way realize something from the public or cheap lands of the West in which they have a common interest with all the other people. The consumers out-number the producers and should therefore be first considered.

The way to "fairly regulate" whatever is bad in the matter would seem to rest with the people to install an administra-

tion that will not set the pernicious example of voting some men's earnings into other men's pockets on a pretense of "protecting industries;" when the real object is to protect individual or corporate greed, and which will treat all combinations to control production and prices as conspiracies against the public weal to be roughly handled without mittens. All interference with the free, easy and natural operation of supply and demand, save for purposes of raising public revenue, whether by combinations inside or outside of congressional halls, start because somebody scents something to be made out of them, not *for*, but *from* the great producing crowd in which the farmers have most prominence.

Prattsburgh, N. Y.

FROM A. L. CROSBY.

1. Yes.

2. It, and the discriminations of the railroads have made the raising and fattening of beef cattle in this section a very uncertain business. If the railroads favor the live meat interests in the fall, farmers will buy cattle to feed during the winter expecting to get fair prices in the spring; but when spring comes the railroads may have changed their rates in favor of the dead meat trade, and farmers will get low and ruinous prices for their cattle. But, apart from the action of the railroads, the immense quantity of dead meat shipped here has injuriously affected the beef interests of farmers.

3. Yes; many of them sell nothing but Chicago dressed beef.

4. A great disadvantage, as, though the farmer may buy his fresh beef cheaper—and this is not a very large item in most farmers' accounts—he can make little or no profit in feeding his crops to beef cattle.

5. Break up the trusts. "How can that be done?" By farmers' votes. "When?" As soon as the farmer will learn to vote for principles, not parties; when he will ask, not whether the candidate for office is a member of his party, but whether he is honest and whether he will use his influence to enact laws that will give the farmer as good a chance as any other citizen to make a fair profit on his labor.

"Will that time ever come?" It surely will, but things must get to their worst, they haven't touched bottom yet.

Catonsville, Md.

FROM A. G. STURTEVANT.

In this section neither the local butchers nor the stock growers as yet have felt any bad results from the Chicago dressed beef trade, owing to the universal prejudice of the people against it. The sale of it has been tried and discontinued. In the city of Wilmington it is sold to some extent. What effect it may have locally I cannot say. If a State has the interest of its farming public at heart as all candidates for offices would have us believe, it can easily protect its farmers by passing a law that all beef should be inspected on foot within the State before killing. This would be effective.

Dover, Del.

R. N.-Y.—It is rather doubtful whether such a law would be constitutional. In States in which such laws have been passed, whenever their constitutionality has come before the courts the decision has always been adverse.

FROM C. M. LUSK.

Broome County does not raise very many cattle for beef. It is principally a dairy section and turns off only dry cows and working oxen when fat. The trade in Chicago dressed beef has made itself felt among us, as we are unable to sell our beef stock, there being no buyers. Up to two or three years ago, the butchers from the city of Binghamton came out in the country to buy beeves to supply their markets, and country butchers also bought home cattle. Now, almost all buy Chicago dressed beef, and we have no market for our fat cattle. It has made a great difference with the business of local butchers. As they buy Western dressed beef, we have no sale for our fat cattle. We used to supply them entirely. The change is a disadvantage to the farmers and cannot be otherwise. The number of slaughter-houses in Broome County is very limited, whereas two or three years ago almost every market had its slaughter-house, and men out buying.

The butchers claim that they can buy in just such quantities as they desire, from a side upwards, and can have it every day without the anxiety of looking after it, and that the beef is of a better and more even grade, and that their customers prefer it at an advance over the price of home-raised beef. This being the case, I can suggest no remedy. If it be a fact that the meat is superior and that people prefer it to home beef, I cannot see how the trade can be stopped. I live 20 miles from the city of Binghamton. Years ago men were here from Binghamton, Philadelphia and other places to buy our fat cattle, and for the last three or four years there has been a continual falling off of buyers; now a buyer of fat cattle is a curiosity. In all probability they can buy Western cattle and Western beef to a better advantage. It is hard on us to compete with the Great West in beef, pork, butter and grain, as it has an advantage over us in the cost of production, and it costs me as much to get a tub of butter or anything else to the city of New York as it costs men to get their produce there from Buffalo, and the freight is nearly as much as that from Chicago. Therefore I can "suggest no means to regulate the matter."

Broome County, N. Y.

FROM SIMON EMERICK.

The Chicago dressed beef trade has made itself felt in this section. The change is manifested by lower prices of beef to the consumer and consequently lower prices for live cattle. It has affected the raising and fattening of beef cattle in this way: whereas the business formerly paid a small profit, now it would not pay expenses. This can be said especially of stall-feeding and preparing cattle for the spring market, consequently this industry has been almost entirely abandoned in this part of the country. Only a few local butchers have retired from the business even in the city of Dayton, where there is an estimated population of 60,000. Some of them buy the dressed beef, while the far greater number purchase their supplies on foot as formerly, but, as I have intimated, at lower prices. Of course the effect proves detrimental to the farmer's interest, and to this extent it cuts off a demand for one of the products of the farm and with it one of the sources of the supply of stable manure.

It would, obviously be a difficult matter to suggest any means by which this outgrowth of steam transportation by rail can be fairly regulated in the interest of the farmer. Whatever may be said of the merits or demerits of protection to home industries, the principle cannot be applied in this case, as the people of the United States occupy one common country, and therefore should enjoy equal privileges and facilities in interstate commerce trade. Dakota wheat has certainly proved detrimental to the farmer's interest here in Ohio; yet it would be absurd even to talk about preventing its introduction here. If dressed beef can be shipped from Chicago to Liverpool, England, in prime condition for human food, it assuredly can be shipped from Chicago into Ohio in as good order, and therefore would be a legitimate article of commerce. Of course, our legislature has the power and the undoubted right to prevent the sale of adulterated and unwholesome food in our State; but the exercise of this power would not necessarily exclude Chicago dressed beef. However much we may inveigh against the monopolistic character of the St. Louis and Chicago capitalists who have rendered the cattle industry so unprofitable to the farmers of Ohio and other States, still the fact remains that they have cheapened the price of beef to the consumers. This latter class are more numerous than the farmers, and they naturally point to the results as the effect of legitimate competition. We are evidently passing through a transition period in American agriculture—a period of over-production, and consequent low prices for the staple products of the farm; and one of the most perplexing questions that confronts the farmer to-day is, how long will this period continue. I am fully convinced that an end will come, for there has never yet been a permanent over-supply of the products of the soil.

Alexandersville, Ohio.

FROM F. P. ROOT.

1. It has in a large degree, and has nearly destroyed the beef-fattening interest of Western New York. The early interests of agriculture in this section of the State depended chiefly on grain growing; other branches of farming, such as dairying, stock-raising, vegetable and fruit-growing, received only incidental attention; but this specialty of grain-growing had the same effect upon our lands that has been experienced in all countries when special cropping has been followed—that of exhaustion of fertility and failure of crops.

To restore the wasted fertility of our soils we were obliged to resort to mixed husbandry involving several interests aside from the exhaustive business of grain growing, and one of the most profitable branches pursued, leading to the enriching of the soil, was that of beef-making. The fattening cattle consumed on the farm all the coarse grain, hay, straw, etc., and much purchased feed was also brought on the farm to be consumed there, making a large amount of manure of the richest quality to be applied to the land, and at the same time affording a fair profit in the sale of beef cattle, which the local markets were always ready to take at paying prices. A few years ago our local butchers began to deal in Western dressed meat, and the prices of home-grown beef began to decline. At the same time the local retail trade has been but little reduced—nothing in comparison to the decline in the prices of live stock, which have fallen off about 30 to 40 per cent. from those current five or six years ago. The present range of prices has destroyed the beef-making business; for our farmers cannot bear the sacrifice which the prevailing prices involve.

2. A reduction of at least 50 per cent. during the past year, and during the coming winter few or no beeves will be fattened as in former years. One farmer near me, who has in past years stall-fed from 50 to 100 steers each succeeding winter, now feeds none. Others have also discontinued the business.

3. Certainly; local markets are largely supplied by Chicago dressed beef. It deprives the farmer of one of the chief sources of enriching his farm by the manufacture of manures which otherwise are not available, and without which our farms must depreciate in productiveness and value. The agriculture of England has doubled in value during the past 60 years, mainly through their system of beef fattening, which has furnished manures for enriching the land, and our agriculture has been greatly improved through the same source during the past decade, and would continue to improve under a system of stock feeding, but this can be done now only at a great disadvantage. It is not easy to suggest any means by which our present condition can be relieved. We are hedged in on every side by a relentless monopoly which in every case "takes all the traffic will bear," and there seems only a chance for the "survival of the fittest." The Chicago butchers are controlling the beef markets of this country and of Europe, and in order to be able to undersell others in dressed beef they have monopolized the cattle trade of the West and so reduced the price of beef as to destroy production at the East, and while the Western plains shall supply their wants, I can see no remedy short of such legislation as will make monopoly and control of prices of food a crime, or until our farmers are so organized as to follow the example of the laboring class—order a strike and lay by until reasonable prices are granted. It is claimed that it makes no difference whether the Western beef cattle are sent East on foot, or whether they are butchered in Chicago and sent through as dressed beef; the supply is the same in either case. This is an error in its application to markets. When fat cattle were sent forward by the drover he had regard for the Eastern market so that it was not oversupplied, and then there was a reasonable competition between dealers; but when the Chicago butchers came to control both ends of the market, buying and selling at their own figures, the only result is to depress markets, and take from the producers "all the traffic will bear."

Monroe County, N. Y.

FROM J. E. SHEPARD.

Chicago dressed beef has completely revolutionized the raising of beef stock as a business hereabouts. Beef is now only a secondary object. Steers and oxen are worked and then fattened; cows and heifers take their turn in the dairy and then go for what they will bring.

Dairying, horse-raising and other branches of farming are now occupying the time and attention of the once successful beef producer. To prove that the result has not been for the bad, in this State, there is a largely increased valuation of live-stock which indicates that beef raising was not the best paying business for New Hampshire farmers. Western beef has made our local butchers independent of any beef produced in this region, a fact they are not slow to take advantage of. They can go to the refrigerator and buy a whole carcass, a side, a quarter or any cut they wish, and they prefer so to do rather than to kill for themselves. As a result the farmer with fat cattle must sell at a price lower than the Chicago beef. To get a price equal to that for Western beef, the stock must be extra choice. The farmer must sell for what the buyer will give or keep the animals. The ready dressed beef has induced a lively competition among the retailers and the effect is lower prices to the consumers. This has resulted indirectly as a benefit to our farmers, who have of necessity given up beef raising and gone into other branches of farming. The business ability of our farmers is increasing with the change; for statistics show that the value of live stock has greatly increased in the last few years in our State. The law of supply and demand, aided by a law requiring the rigid inspection of all live animals before slaughter and of all dressed meat where received at distributing points, seems to me the only fair means of regulating this traffic.

West Concord, N. H.

FACTS FROM FARMERS.

SPRAYED FRUIT TREES.—That great advantage is derived from spraying fruit trees with London-purple is no longer a question but an established fact, which is proved by the testimony of all the leading agriculturists and entomologists not only in this country, but through the whole civilized world. Some of the more intelligent among fruit growers have not been slow to take advantage of the benefits it yields; but there are still millions who, either from carelessness or a natural tendency to disbelieve in anything new till its virtues have been thoroughly tested by their neighbors, have as yet not tried it, thus letting some competitors get ahead of them in their own particular profession. For years the agricultural press has been a warm advocate of this operation. By destroying insect pests the life of the tree is often prolonged in full vigor thus enabling it to feed its fruits and bring them to perfection. The fruits from sprayed trees are not only more sightly (an important, if not the chief point in a marketing sense), but they are much larger and more numerous. Any expense for necessary outfit, would be repaid the first season ten times over by the increase in value and quantity of the fruit. Spraying is not only an absolute necessity to the professional fruit grower, but the small producer or farmer whose few trees are expected to supply only his own household, and who in many cases, from neglect, fails to obtain fruit fit for anybody but the hogs, would be benefited in pocket as well as by making his now unsightly, leafless trees a pleasure to the eye and more in accordance with the rest of his well cultivated farm. H. E. B.

Fort Hamilton, N. Y.

THE BEST WAY I HAVE EVER FOUND to kill Liveforever is to dig a hole about four or five feet in diameter and five or six feet deep (the deeper the better) to put it in; leave two feet on top. Then fill up with the soil thrown out. Be sure to dig it before plowing. I found a stalk of Liveforever in the hay last spring; I put it in a plant dish and it grew nicely. Such a hole is a splendid place into which to throw weeds that are nearly ripe, broken glass and all waste from the kitchen. It will give an opportunity for a clean back yard. Of course, in some soils it would be hard to dig such a hole W. H. D.

Middlebury, Vermont.

AS THE TIME FOR HUSKING CORN has arrived, I send the RURAL my method of saving corn husks for bed mattresses and ticks. Do not loosen the husks from the ear, but press it close to the base and break it off. The rough, coarse husks will be left on the stalk and all the finer sort on the ear. Throw the ears in a pile and when enough are broken off husk them, sort out the "silks," and you will have a very superior article. L. H.

Dansville, N. Y.

Dairy Husbandry.

DAIRY NOTES FROM A DAIRY RANCH.

No. V.

RAISING CALVES, TESTING COWS, AND HANDLING BULLS.

As I have better uses for my new milk than to raise calves upon it, all of my calves are hand-fed. If the mother is a young cow the calf is never allowed to suck, for if it does it will be all the harder to break the

dam into being milked; and it often injures her as a milker, because in her restlessness and anxiety about the calf she learns to hold up her milk. With an older cow it does not matter so much. In either case the calf is fed its mother's milk until it is fit for use, which is generally conceded to be at the fifth milking. After this, the youngster is fed skim-milk, sweet and warm, three times a day, care being taken not to spoil the appetite for the next meal by any degree of over-feeding. Every day or two, common table salt, in small doses, is mixed with the milk. This is thought to help greatly in keeping the calves hearty and well. Should they get "off their feed" or "scour," they are made to swallow one or more raw eggs per day, as the exigencies of the case may require. Regularity in time of feeding and uniformity in the quantity of feed are very important. Calves so fed can be made fat enough for veal. I disposed of four grade Holstein calves for veal that averaged in weight 175 pounds each when three months old. They grew to this size on the feed that was given all the calves, with no special effort to fatten them. A box of wheat bran always stands where the calves can lick at it and learn to eat it, and they early show a desire to pick a little hay. Every milker can guess pretty nearly as to the quantity of milk his cows give, but in the quality of the fluid there can be no guess-work.

It is essential to test the value of each cow as a butter-maker to operate a dairy of more than one cow successfully. Some cows make twice the amount of butter from the same amount of milk that others do; some make white butter—often it is white and hard—others make very yellow butter, and too often it is as soft as it is yellow. Years ago I owned an imported Guernsey cow that made butter as yellow as a carrot and so soft that it spoiled the "gilt-edged" properties of my butter all one summer, and it was only by accident that I discovered where the trouble lay. I remember another, a grade Jersey, that made the finest-colored butter and the hardest I ever saw, and the addition of her milk to my dairy of six cows made a very noticeable improvement in the quality of the butter; firmness and high color of butter are two desirable qualities that are not always combined in the butter from one cow.

In breaking my bulls to be handled, I have so far been very fortunate and have had no dangerous animals. When about a year old a ring is put through the cartilage of the nose. The animal is never allowed its liberty, but it is picketed near the barn, during the day, its feed being carried to it. Or it is led by the ring to water and about the place with as little trouble as a well-broken horse. The Holstein bull that has stood at the head of my herd for four years, has always been managed in that way and he never has shown any disposition to quarrel with his keepers. One thing about him worthy of mention is the ease with which he is kept. No attempt has been made to keep him in other than a good growing condition; but at four years of age he turned the scales at 2,000 pounds. O. H.

NOTES ON FUNGI.

ANTHRACNOSE OF THE BEAN.

Its victims; its effects; mode of spreading; structure; classification; proof against the Bordeaux Mixture.

THE disease commonly called bean-rust is only too well known to gardeners, but they are not so well aware that the same disease attacks the melon and is even more disastrous to it than to the bean. In the latter case it rarely attacks anything but the pod, although it does occur on the leaf and stem, but it not only attacks and destroys the melons themselves, but by destroying the leaves may prevent the perfect maturing of the fruit even were the fungus entirely absent from the latter.

The appearance of the diseased beans is too well known to need much description. The pods become more or less covered with dark-brown spots which are often surrounded by a reddish-brown border, while the center is covered with a whitish or flesh-colored powder. On the melon rind we see large, sunken, discolored areas which, as in the case of the bean, are covered with a fine, flesh-colored powder. Underneath these spots the tissue of the bean and melon are shrunken and discolored. On the melon leaves appear large, or smaller dead areas, over which are scattered tiny heaps of the same powder which are so small that they are barely visible to the naked eye.

The cause of all this trouble is a fungus growing within the tissues of the diseased plant. It is as much a plant itself as the one on which it feeds, but is built on a much simpler plan. It is composed simply of long, slender, branching filaments which wind through the tissues of the host plant, and come to the surface in certain places. Where they do this, celled spores or reproductive bodies are cut off from the ends. These spores falling on a healthy bean or melon will grow out into another filament which will bore its way into the plant and there by continued growth produce another diseased spot. It is popularly supposed that the spotting of bean pods is caused by wet weather or by a damp situation. It is really produced by the spores of the fungus and will not occur unless these are present; but these spores cannot germinate without moisture, hence a dry, airy locality is the best and surest preventive of the disease. A gardener once wrote me that a single wet night would sometimes develop spots on hitherto healthy pods. I was inclined to doubt the statement until I placed an apparently healthy pod one night in a moist chamber, and found several spots on it the following morning.

Some reader may be interested in a fuller account of the structure of the fungus. As has been stated, it is composed of slender branching filaments; where these filaments approach the surface they branch repeatedly; the ends of the branches stand upright, side by side, and the spores are borne on the tips. It is these spore masses that form the flesh-colored powder already mentioned. The spore-bearing branches themselves are colorless and short, but scattered over them are a few longer, brown filaments, appearing like brown hairs. Whether they are really a part of the fungus causing the disease has never been absolutely proven, and it is quite possible we may have here a case of one fungus attacking another. However, Cavara, an Italian author, has considered them of sufficient importance to change the classification of the fungus. The fungus has hitherto been classified as a Glœospori n. Fungi of this genus are very destructive and very hard to eradicate. It is a Glœosporium that causes the well-known cane-rust of raspberries and blackberries, better known as Anthracnose of the raspberry and blackberry. Another attacks the grape, and while not so destructive as black-rot, is even harder to treat. Still another causes the sycamore blight, and where there are no sycamore trees it attacks the oak. If, however, the new classification be adopted, as it probably will be, the fungus must be known as Colletotrichium Lindemuthianum, the first part of the name meaning glutinous hairs.

Some experiments made this year by Col. Pearson on melon vines indicate that the Bordeaux Mixture, usually so effective against fungi of all sorts, has no effect whatever on this disease. Mr. B. T. Galloway has visited his place during the summer and seen the disease developing on melons covered with the mixture. This was also true of the Anthracnose of grapes, where the same treatment had prevented black-rot; and various reports which have come in during the summer go to confirm the idea that this disease belongs to a class very resistant to fungicides.

E. A. SOUTHWORTH.

The Vineyard.

THE WOODRUFF RED GRAPE.

SECRETARY CAMPBELL'S OPINION.

I SEND the RURAL by mail a sample of a few berries of the Woodruff Red Grape, from a young vine in its first bearing, hoping the editor may not find it quite as inferior as he has heretofore seemed to regard it. I have several times expressed, in the RURAL NEW-YORKER, a favorable opinion of this grape for general use; and I have seen no reason to change my opinion. I have always thought it a little strange that the RURAL considered this grape so poor as to be unworthy a place in its grounds, especially as it has received commendation from such men as Lyon and Garfield and Crawford and Miller and many others, and I have thought it must be either that the editor had not the variety true; or that there must have been some unfortunate circumstance of soil or season that prevented its normal development. I know that taste is a matter not to be disputed about; but so many do like this grape, and it has so many valuable characteristics to recommend it, I cannot help the belief that if the RURAL had left its vine to stand for further trial, the editor would have regarded it more favorably, under perhaps more favorable circumstances. It is more vigorous in growth, and certainly as hardy and healthy as the Colerain; has larger berries and cluster, and so far as tested here has been more productive.

I quite agree with the RURAL as to the probable value of the Colerain. It has a vigorous, healthy vine, with pure Labrusca foliage, and is probably as hardy as any of the Concord seedlings of its class. It ripens early, is handsome in appearance, and very good; and I hope to see its originator duly rewarded for the production of a grape apparently so worthy and so good. There is, in my judgment, no good point possessed by the Colerain, that the Woodruff has not, except it may be in flavor. The color of the Woodruff is also in its favor, as there now seems to be a lack of good, red, market grapes earlier than the Catawba, and I really think the Woodruff the most promising *red* grape that I have ever seen or tasted, for general planting, as the Concord and Worden, and such popular varieties are planted. And as the great mass of the public, who buy, and eat grapes, will regard it as good enough, and entirely satisfactory, its other good qualities must make it one of the most valuable and popular grapes, even if its quality does not come up to the highest standard of excellence required by the most fastidious tastes. I have written more than I intended when I began; but I do not like to appear in the position before RURAL readers, of recommending a grape beyond its merits; or in opposition to the views or opinions of the editor. [Readers of the R. N.-Y. will no doubt accept the opinions of Secretary Campbell regarding grapes before they would those of the R. N.-Y. And that is just as it should be. Eds.]

The past season has been a disappointment to grape-growers in this region and, I think, generally throughout the State. Although the early promise was good, excessive rains and very cool weather at the time of blooming seemed to prevent fertilization and the clusters were either destroyed or produced loose, uneven and very imperfect fruit. Even the hardiest kinds, such as Moore's Early and Concord, produced but little, and the berries were small, and the clusters loose and inferior. The latter part of the season was more favorable, and we have the somewhat singular experience of the early and late varieties ripening very nearly together, the peculiar season seeming to retard the early, and hasten the maturity of the late ones. Another noticeable circumstance is that all varieties with the short filaments and reflexed stamens failed to a much greater extent than those with the long filaments and erect stamens, or what we call perfect blossoms. This includes several of Rogers's Hybrids, Brighton, Moyer and some others, which failed almost entirely, the blossoms falling off and setting little, if any, fruit.

Delaware, Ohio.

R. N.-Y.—The berries sent were, in the R. N.-Y.'s estimation, much the same as those grown at the Rural Grounds and sent to this office from time to time, except that the foxy flavor is less pronounced. Our objection to them is the tough pulp from which it is difficult to separate the seed.

JOHN BURR'S LATEST GRAPES.

THE R. N.-Y. has received a box of grapes from John Burr of Leavenworth, Kansas, containing a number of his seedlings. No. 13 is a blue-black grape, of medium size with a dense blue bloom. Skin thin but quite firm; pulp, rather tough; seeds large. The quality is sweet and pure. No. 11 is a large, green grape tinted with purple. Skin about like that of Concord. Seeds large. Pulp rather tough. It is sweet, but not of high flavor. No. 15 (Paragon) is a black grape, juicy, sweet, of fair quality. No. 14 is a green grape of medium size and fair quality. Seeds rather large, skin strong. No. 16 is much like No. 14, though more juicy and sweeter. Skin firm. Minnehaha is rather larger than Delaware; green without bloom, translucent, almost transparent. Pulp tender, juicy. Skin firm. The bunches are long and double-shouldered. Eclipse is a green grape of medium size, firm skin and fair quality. No. 9 is a red grape of excellent quality. Juicy, sweet; pulp tender; skin firm. The bunches were injured in transit and many of the berries decayed. Standard is a blue-black grape of medium size. The bunches are shouldered, rapidly tapering to a single berry. Skin thin and firm, juicy, pulp about like Concord. It is not of high quality.

Mr. Burr has labored perseveringly through many years in the vineyard and many of his varieties are prized in various parts of the country.

The following note from Mr. Burr should be read in connection with our necessarily imperfect report of the quality of the grapes sent, size of bunches, etc.

LEAVENWORTH, Kansas, September 6.

Editor R. N.-Y.—I sent you yesterday by United States Express a small basket of grapes. They are not good specimens as our season has not been at all favorable for the development of good quality. An early warm April and part of May caused an early strong growth. About the middle of May when the vines were mostly in full bloom, cold rains set in lasting 10 or 12 days, with two frosts, which retarded and chilled the blossom so much as to destroy their vitality to such an extent that most of the clusters are not half filled with fruit. The Standard is full and is one of the most reliable; it has not failed of a full crop of perfect fruit since it first commenced bearing eight or nine years since; vine hardy, healthy, very vigorous and enormously productive, quite free from rot, mildew or cracking of the berries which remain perfect on the vine throughout the season. The Ideal is a seedling of the Delaware. The vine is very strong and vigorous, hardy, healthy, and enormously productive; the very small cane with the two clusters will show something of its character. Every branch shows fruit and a good-sized cane usually gives clusters one-third larger than either of these two. None of my grapes are as good as usual owing to almost continuous rain and a cool summer. The Paragon shows clusters not over one-half the size they were two years since. It is a very healthy, hardy and vigorous grower and very productive. The Eclipse is generally about the size of a well grown Concord. The two clusters sent are no criterion of its ordinary size, and it is now past its prime. It is an uncommon grape; the vine is one of the strongest growers I have, with the largest leaf, and it is quite hardy and healthy. I hardly need speak of the others sent, as the clusters are not full enough to enable one to judge what they are or should be except for variety.

VINEYARD HINTS.

L. D. SNOOK.

IT is conceded by all that without a sufficient amount or number of roots we cannot produce a vigorous growth of vine or fruit, and the Concord is considered one of the most rampant growers, with a wealth of roots and hardiness that far eclipse the Delaware and other delicate varieties; hence in examining a large vineyard not long since, I was surprised at the rank growth of Delaware vines and the amount of fruit they were carrying, which the proprietor—Mr. John J. Smith of Dundee, N. Y.—fully attributed to his method of grafting the Delaware on Concord roots, and his method has the merit of originality and success, hence I send it to the RURAL for publication.

One-year-old Concord roots are taken from the nursery row, or rather bed, and instead of being set in the vineyard in the position in which they grew, are laid down flat in a trench of the proper depth, and two buds of the previous year's growth are allowed to remain above ground, as in Fig. 248, in which *a* is the cutting and *b* a portion of the first year's growth, and *c* the surface of the ground. The Concord vine is allowed to grow one year in the vineyard and presents an appearance quite like that shown at Fig. 249, in which one can see that several more bunches of roots have been thrown out at the covered buds. This cut also

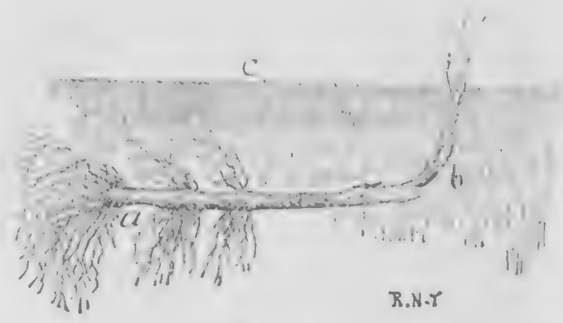

Fig. 248.

shows the graft or cion in position at *g*, two buds being left above ground. In this sec-

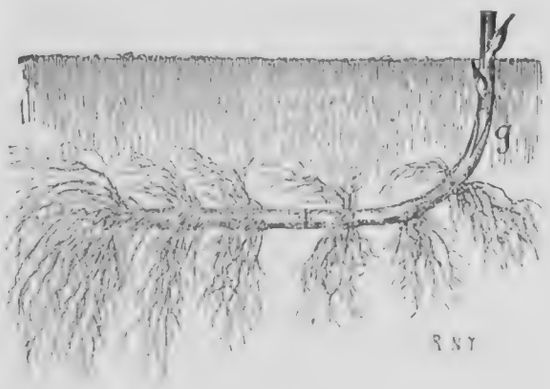

Fig. 249.

tion grafting is done from April 1 to May 10, and if carefully done 90 per cent. will live. Those failing to unite, of course, send up a Concord shoot. By this plan any delicate or feeble-growing variety can be placed on strong-growing roots that are already firmly established in the soil.

Mr. Smith was one of the first if not the pioneer in dispensing with wooden braces at the end of the vineyard trellises, using wire instead. To the last post at the surface of the ground is firmly secured a wire, as shown in Fig. 250. This is attached to its

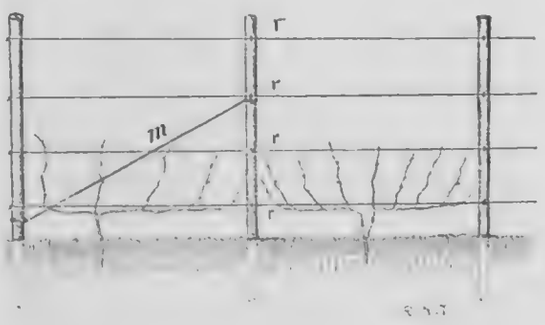

Fig. 250.

nearest neighbor at some point near the top and this is usually done ere any of the main wires *r r r r* are placed in position. It is plain that the second post is the one that bears the strain. This plan is cheap, neat and highly satisfactory. For the brace one should use wire several sizes larger than for the trellises.

Yates County, N. Y.

Everywhere.

RURAL SPECIAL REPORTS.

Delaware.

DOVER, Kent County, September 14.—The wet season still continues, much to the detriment of crops and farm work. Peaches are about all gone. The favored few who had them, realized fine prices. The crop being limited to a very small section, very few growers are the gainers. From Wyoming Station the peach center of the State, if not of the world, growers and dealers could not ship more than three to 10 carloads per day during the season, against 30 or 40 when anything like a fair crop is produced. Corn is not a good crop. About half of the corn-growing section of the State will not produce enough for the use of the growers until another season, and the heavy storm of the past three days has about ruined corn-fodder. What corn was cut is about all down, wet and moldy, and what is standing has been completely whipped to shreds. This will entail a serious loss of feed; for no where else is the full value of corn-fodder so highly appreciated as in the South, as nearly all stock is wintered on it, and certainly where the old Southern plan of saving it is still practiced nothing of the crop goes to waste. The corn is topped, the tops being thrown in convenient piles to cure, then bound in bundles set up around a hill, then the tops are tied and the shocks are left standing to cure. The blades below the ear are then pulled and stuck in the hill so that by going between two rows one can take up the fodder of four, when properly cured. This process makes feed which the finest hay cannot equal, and hands used to the work do it with great rapidity. After husking, the stalks should be cut and fed in the yards dry; stock will winter well on them without any other feed, and nothing except the heavy stalk is left uneaten and this is soon tramped into manure. Early potatoes were a good crop, and the condition of late ones indicate a fair one. Apples are mostly on the ground and will be of no value except for cider. No fruit has been dried except a little for home use. A great share of the wheat crop is still on the growers' hands; much of it was damaged before it was thrashed. Grapes were a failure. Pears were a fair crop. Factories are putting up tomatoes. At present $6 per ton is the price paid for them. The present outlook is not very encouraging for farmers. Market quotations: wheat, 70 cents; corn, 40 cents; oats, 30 cents; butter, 20 cents to 25 cents; eggs, 18 cents; potatoes, white, 40 cents; sweet, 50 cents to 60 cents. A. G. S.

Michigan.

LANSING, Ingham County, September 10.—The present is a very unfavorable season. The fact that it was cold and wet early, and hot and dry later makes the corn crop very backward. This is another point in favor of the silo. This year, unless we get rain very soon and have a very late fall. the corn crop will be worth very little for husking; but with a silo we can save it so that it will be of great value. The silo men ought to be very happy this year. A. J. C.

New Hampshire.

SOUTH SUTTON, Merrimack County, September 16.—I am a real farmer; not a person who merely makes pretensions, and if there is any farm work I cannot do, it is simply from lack of strength—I weigh only 106 pounds. I have done in the hay field this year all but the mowing and pitching; I spread, rake, (with and without the horse) load, and take away the hay. Now I do all the work, except that some help is given by father whose health is very poor, and mother, and I also hire by days' work "some." I would rather do it than have a great lazy, bragging man around, most of whose work I would have to do besides waiting on him. Since father's health failed I have done more out-of-doors work, and I am not dependent. Some change must come soon for farmers in this section or they will fail in many places. I never saw stock so low; good seven feet well matched oxen, beef, or work, are only $100, and no sale at that. Beef is very low; good round steak, 11 cents per pound down to seven cents; Western beef side, seven cents. Butter is very low. I have a dairy of six cows and at present prices they can't pay their keep, so that we hold on to them only to keep the farm up. I can buy Western meal and corn cheaper than I can raise it, at the high price of help. I have been much interested in the "pictures of cattle and horses" in the RURAL. We have a horse which I think is more than common. She is in the hands of my brother-in-law at Newport, N. H. He had her photograph taken in July. She was foaled in June 1854. Her sire was Flying Morgan, son of Justin Morgan. Would the RURAL like to have me write a short sketch of what she has done, and send her picture as a type of the true farm horse for New Hampshire? She is no trotter. She has done a mile inside of three minutes only; but after she was 25 she traveled in 20 minutes five miles with a common light buggy and one person. I drove her from pasture alone, with no grain 25 miles in two hours and 20 minutes with a light buggy and two persons, and to-day she can go a 10-mile gait for a time. She is perfectly sound after these long years of hard work and hard driving. This is the kind of horse we want and need here—not the little trotter or heavy draft horse. Our horse, her daughter, is 21 years old and as smooth as a colt; but not as good as old Fanny. Give me the true Morgan horses every time. Horses are one of my pet hobbies, and dear old Fanny is in part the cause; for I tended and drove her in my "teens" and she taught me to know a good horse, for neither she nor I like the dust.

MISS H. B. C.

[R. N.-Y. Send us the picture by all means. We shall be glad to use it.]

New York.

NEW YORK CITY, Sept. 17.—To the diligent observer of natural phenomena, to the student in any branch of natural history, there is nothing so delightful as the witnessing of an event of rare occurrence, or the finding of a new species, or of a locality before unknown, either in the mineral or vegetable kingdom. I had the pleasure but a short time since of visiting a little mountain lake situated about seven miles back of West Point, New York. Even its name, Popelopen, is suggestive of the early history of one of the most beautiful sections of the Hudson River Highlands. Whether the name is derived from some tribe of Indians, or perhaps from a chief, I know not; or whether it is descriptive in a measure, does not matter. Though at an elevation of not less than 500 feet above the Hudson, the mountains rise on every side to a hight sufficient to afford it a most beautiful setting. I am fairly well acquainted with mountain lakes, and ponds; but this is certainly the gem of all those I have yet seen—a miniature Lake George, following its prototype with pure water and great depth, and with deeply indented bays and lovely islands. Securing a boat, with my companion, we made the circuit of the lake; and upon reaching the head of a little bay, we found growing upon the rocky hillside and in some instances reaching down to the water itself, a large and luxuriant plantation of rhododendrons. This was surprise number one—I had previously explored, as I thought, every nook and corner of the Highlands either for mineral or botanical specimens, and was no stranger to its wealth in either direction. But here, not over a mile from where I had been before, did I find this far northern outpost of this most beautiful evergreen. My friend said: "You seem to be so enthusiastic, I will give you another surprise before the day closes." On our way down from the lake to the river, and when we had reached the outskirts of the little village of Highland Falls and the dwelling of Anthony Miller, Sr., my friend made his promise good. Here I was shown a little grove of English walnuts, growing as sturdily and seemingly as much at home as the native oaks and walnuts, their near neighbors. These trees had been planted about 12 years ago, are now about 20 feet high, and measure from 10 to 12 inches in diameter. The leaves run rather thicker than those of the American walnut and their growth is more luxuriant. The trees have been bearing for three or four years, and are full of well developed nuts this season. I think it not necessary to draw any moral. In one instance a plant needing a favorable location is here found occupying a cold hillside and growing, not in a sickly manner, but with every evidence of staying power. In the other instance, a tree whose fruit is imported to the extent of thousands of dollars' worth yearly, is found growing not in a hot-house, or partly sheltered, but in an exposed position, and holding its own with the native tree. A. S. C.

JOHNSON'S, Orange County.—The terms "Orange County Butter" and "Goshen Butter" were very familiar in the market reports of thirty years ago and more; but the present generation that is growing up to be farmers will have to be told what these terms mean when they occasionally hear them spoken; for within the boundaries of this formerly great butter-making region there is scarcely a tub of butter made to-day. This whole territory is given up to the production of milk for the New York market. As the country is bisected by three or four trunk lines of railroads, and many short branches, and the temptation to abandon butter-making and send milk to market is irresistible, so, with the exception of what little milk goes to creameries, all goes to New York City. M. H. C. G.

Wisconsin.

BARRON, Barron County, September 10.—Crops in this portion of Wisconsin are very good, but prices are ruling low. Potatoes are an enormous crop and will probably sell for not more than 10 or 15 cents per bushel. T. W. P.

THE FARMER'S CLUB

ANSWERS TO CORRESPONDENTS.

[Every query must be accompanied by the name and address of the writer to insure attention. Before asking a question, please see if it is not answered in our advertising columns. Ask only a few questions at one time. Put questions on a separate piece of paper.]

BERRY CULTURE.

J. S. R., Harrisburg, Pa.—I expect next spring to move on a small farm in Ohio and try to make a living on raising fruits and berries. 1. I shall plant one acre each of strawberries, raspberries and blackberries. About how many bushels of berries will each acre yield by giving time and attention to their cultivation? 2. How early in spring should the plants be set out; and of what age should the plants be; and will they bear anything the first season? 3. Where can I get a book on berry culture and at what price?

ANSWERED BY M. CRAWFORD.

1. Strawberries yield from 75 to 300 bushels per acre. In exceptional cases, over 400 have been obtained. Raspberries and blackberries yield from 50 to 100 with a possible 150 2. As early as the ground can be worked, using plants of the previous season's growth. No fruit may be expected the first year. Strawberries will give a full crop the second year, while the others will not yield over half a crop and often not more than one-fourth. 3. The RURAL NEW-YORKER, Popular Gardening and American Garden will give the best information obtainable on fruit culture. It has become so that the person who will grow from one to two or three acres of each of the fruits named—just what can be well grown and sold in the vicinity—will make all there is to be made in the business. It is no longer safe for any one in Ohio to plant a large area with the expectation of shipping to a distant market. All markets are coming to be supplied by growers in the vicinity except with early berries from the South. There will always be a chance for the one who will raise choice fruit and get it to market in the best manner. The strawberry responds so readily to extra culture that it is not very hard to raise 300 bushels or more per acre, while black-caps that yield from 50 to 75 with no culture can hardly be made to produce over 150 with the best possible chance. Red raspberries are not appreciated in Ohio as they are in the East, and one should be cautious about planting too many until he knows his market. When one is obliged to buy raspberry tips he should procure them very early and set them out temporarily a few inches apart. After they are six inches high they may be planted permanently, rejecting all that are too weak. In this way the plantation will be uniform, and all vacancies will be avoided. In many parts of Southern and Southeastern Ohio there is no profit in raising blackberries as the wild ones are so abundant. The great secret of success in raising small fruits is to stir the soil frequently without going deep enough to injure the roots.

MR. J. M. SMITH'S METHODS OF STRAWBERRY CULTURE.

N. H. O., Wayne County, Michigan.—Will Mr. J. M. Smith of Wisconsin tell us what treatment he gives strawberry plants after September 1?

ANSWERED BY J. M. SMITH.

I set my strawberry plants in the spring, putting them two feet apart each way. After setting them I set out early onions, lettuce, or sow radish seed, dwarf peas, or beans between the rows and thus take off one crop before the runners really get fairly started. As soon as they begin to take root, we go through the beds and train the runners around the parent plant like the spokes in a wheel, each parent plant standing for the hub. In this way I get an even stand of plants, and get them fairly distributed over the ground. We do nothing more during the remainder of the summer and fall, except to keep the ground clean and in the best of order for the young plants to do their best.

The plants occupy the ground so closely, that we are compelled to do the work entirely by hand and our hoes. After the ground becomes frozen, which is generally by the last of November or early in December, we haul marsh hay and spread it upon the beds in quantities sufficient to entirely hide the leaves from view. After freezing and thawing in the spring have ceased, we take off the cover and stack it for another winter's use, put a coat of wood ashes upon the beds, keep them clean, and then expect and generally get a very large crop of very fine fruit. As soon as we are done picking, we turn the beds under and set them with either cabbage or celery for a fall crop. This, of course, makes it necessary to set new beds every year, and it costs more per acre to grow the fruit, but the crop is so much larger, and the fruit is so much nicer, that I have found it far more profitable than any other way that I have ever tried.

A MIXTURE OF GRASSES FOR PERMANENT PASTURE ON A LIGHT SOIL.

C. C. P., Hempstead, L. I.—Several of us living near here are getting ready to seed the pastures; what is a good formula for a mixed grass seed, suitable for a permanent

Miscellaneous Advertising.

"Herbrand" Fifth Wheel for Buggies.

pasture on the light soil of this locality. The ordinary Timothy and clover run out too soon, and I have read in the RURAL that besides holding longer in the soil, a mixed grass seed yields a heavier crop.

ANS.—The soil around Hempstead (Long Island, N. Y.) requires a special mixture of grasses, and the following has succeeded very well in that locality, viz: six pounds of Timothy; six pounds of Meadow Foxtail; six pounds of Tall Oat Grass; six pounds of Meadow Fescue; 12 pounds of Orchard Grass and five pounds of Medium Red Clover. As almost all plants are sociable and produce more herbage when grown in company, a suitable mixture of grasses yields more pasture than any one kind grown alone. But while this is true, it is equally true that this increased produce calls for proportionately adequate manuring and thorough tillage before the land is seeded. Consequently a light annual top-dressing should be given, the best season for this being the late fall when the pasturing is over. An excellent top-dressing would be 250 pounds of superphosphate, 150 pounds of potash salts and 100 pounds of nitrate of soda. The increased yield will abundantly repay the cost of it.

FERTILIZER FOR FRUIT TREES.

H. E., Hamburg, Conn.—1. I have a small peach orchard of about 50 trees which were set five years ago last spring when they were two years old. Two years ago this fall I gave them a dressing of bone flour and kainit. They have given me a good crop of fruit this fall and I wish to give them another dressing. What will be a suitable amount, per tree, of the above named and in what proportions? 2. Would a coarser grade of bone costing less answer as well? 3. I have in the same orchard a few plum trees of the same age; would the same treatment be suitable for them? 4. I wish to remove some asparagus roots in my garden this fall, what will be the best time to do so?

ANS.—1. Ten to 15 pounds of fine ground bone, and four to five pounds of high-grade muriate of potash per tree are not too much annually per peach tree of bearing size. The muriate is better and cheaper than the kainit. 2. As peach trees at best are short-lived, it is best to use the fine bone and obtain prompt returns, as it will be some years before the coarse bone is likely to give full value. 3. Much the same fertilizer will answer for the plums except that possibly not so much potash is required. 4. Asparagus may be transplanted in Connecticut at almost any time in October or November.

FEED FOR PIGS.

I. K. B., Princess Anne, Va.—What proportion of the following feeds should be given, and what is the best way to prepare them for young pigs? Corn, corn-meal, cotton-seed meal, wheat shorts, sweet and Irish potatoes. I have no milk so have to do the best I can without. How much cotton-seed meal can I feed to fattening hogs, with corn or corn-meal? All my hogs have a large range, though the pasture is not very good.

ANSWERED BY HENRY STEWART.

Cotton-seed meal is not a healthful food for pigs. In every case in which I have used it for this purpose it has been injurious even in small quantities. It is too nitrogenous for them. In the absence of milk, an excellent food can be made up of potatoes boiled and mashed with the water into a thin paste and mixed with a sufficient quantity of corn-meal and bran, so that when it is cool it can be lifted with a shovel. This mixture is not only extremely nutritious but it is a well balanced and healthful food, for growing, as well as fattening pigs. The proportions I have used are as follows: One bushel of cleanly-washed potatoes; five pounds of corn-meal and 10 pounds of bran. For nursing sows I have given this mixed food boiled with water to the consistency of a gruel, adding a little salt to each feed.

KEEPING GRAPES.

Mrs. H. C. A., Lansing, Mich.—How can grapes be packed for winter use? I tried packing in newspapers—a layer of grapes then paper, then grapes till the box was filled. In a few weeks all were spoiled. Last year I used cotton-batting with no better success.

ANSWERED BY E. WILLIAMS.

I cannot tell how to do this till I succeed in doing it satisfactorily myself. In the first place, much depends on the kind of grape; few of our native grapes have much keeping qualities: Catawbas and Isabellas are probably among the best. Catawbas, with perhaps Dianas, are to be had in our city markets in winter in fair condition. I succeeded tolerably well in keeping the Isabella for a few weeks or months years ago; but all attempts of late years with the present varieties by using warranted methods have utterly failed. A cool, dry cellar or a fruit house has, I think, more of the elements of success than the mode of packing; but with ordinary appliances I have yet to learn the art of keeping any of my grapes much beyond the first of November.

PUMPING FROM A DISTANCE.

E. T., Chappaqua, N. Y.—I have a well 20 feet deep in which it is 10 feet to the water. It is 160 feet of level ground to the house. Can the water be pumped to the latter? If so, what size pipe and what kind of pump should be used?

ANS.—There will be no difficulty in pumping water from a well under these circumstances. One inch rustless iron pipe with the unions or joints cemented with white lead so as to be air-tight and any good suction pump will answer the purpose. In laying the pipe it should be put below the reach of frost and should incline downwards about one foot from the well to the pump; a check-valve should be put in the bottom of the pipe in the well so as to keep the pipe always full of water and prevent it from filling with air in case of any leakage through the pump valve.

Miscellaneous.

R. A. W., Genesee, N. Y.—Where can a trio of pure, well-bred Dorking chicks, both Silver-gray and White be obtained at a reasonable rate?

ANS.—From Henry Hales, Ridgewood, N. J.

J. E. N., Genesee, N. Y.—The plant sent for name is the Swamp Rose Mallow—Hibiscus moscheutos. Though it is usually found wild on the banks or meadows of brackish water, it thrives better in garden soil, even in high, dry situations.

J. McC. Jr., Salem, N. Y.—Are the Redcap fowls any better than Leghorns for broilers?

ANS.—The R. N.-Y. cannot answer from its own experience for the reason we have never killed any of the birds. Our eggs were purchased of W. Atlee Burpee & Co., Philadelphia, Pa.

"*Subscriber.*"—What American breeder raises the Black Orpington fowls?

ANS.—The Orpington is a new breed just "come out" in England. Birds are offered for sale in advertisements in English papers by George Weaver, Rumford, Essex at the rate of eight guineas for trios delivered in New York. They were originally bred by W. Cook, of Orpington House, Kent, England. We do not know of any American dealer who handles them.

J. A. T. & Sons, Argenta, Ark.—Omitting manure, what is the best fertilizer for asparagus and when and how should it be applied? Where can rubber bands for tying bunches be obtained.

ANS.—We suggest raw bone flour and unleached ashes. You may apply it now or in the spring. The R. N.-Y. decidedly prefers spring. Apply all the way from 500 to 2,000 pounds of bone to the acre according to your aims and means. Of ashes, from 10 to 50 bushels. As to rubber bands inquire of any stationer.

J. H. C., Tabernacle, N. C.—1. What is a good early variety of wheat suitable for this section? 2. What is the best fertilizer for wheat, and where can it be obtained, and how much will it cost per ton?

ANS.—1. The R. N.-Y. prefers not to recommend any particular kind of wheat for localities in which it has had no experience. The safest way for our friend would be to try a small quantity of the several varieties now most popular, such as Fultz, Clawson, Landreth, Golden Cross, Red Clawson, Diehl-Mediterranean, etc. Johnson & Stokes of Philadelphia, Pa., and Henderson & Co. of New York publish catalogues with lists of wheat. 2. We cannot tell you what would be the best fertilizer for your land; that is, the most economical. In the absence of such information we would advise you to buy a high grade of complete fertilizer manufactured by various companies especially for wheat. The cost will be about $40 per ton.

Discussion.

ABOUT THE MONTANA BOOM.

W. O. F., GREENSBURG, INDIANA.—I am one of those who have been reading the fascinating descriptions of the Milk River Region of Montana, which are now appearing in some of the agricultural papers from the pens of their editors who have been making tours through that region. I am also one of those who are looking to the West as a place for a future home. To me, the RURAL'S late editorial on this subject, was very timely. I very much doubt whether all they write about that wonderful land, and its perfect climate, gives a true picture of it, the whole year round. From most of the descriptions it would seem to be a veritable Eden, and though so far north, they say that its winter climate is so tempered by the chinook winds as to be less rigorous than our own here in Indiana. But I have recently encountered a statement in the World Almanac for this year, which seems very contradictory to all the above mentioned writing. In a chapter entitled "Climate and Rainfall in the United States," compiled for that publication by the Chief Signal Officer, I find the following: "Observations were made at three points: Fort Assiniboin and Poplar River both on Milk River, and Fort Custer in the southern part of the Territory. The mean annual temperature at Fort Assiniboin was 40.8 degrees; at Poplar River 37.6 degrees, and Fort Custer 44.2 degrees. The lowest temperature reported from any part of the Territory was 63 degrees below zero." This is 10 degrees lower than was reported from any other section of the United States. Montana is a very large Territory and has a great diversity of plains and mountains and valleys, but it does seem to me that it would hardly be safe to get anywhere in the neighborhood of a place where the thermometer presumes such freaks as reported of it here. Let all the truth be told and then justice will be done to all parties concerned. Editors who accept courtesies and perhaps pay from railroad companies and town-site syndicates and in return make their editorial columns advertising mediums to boom the property of their patrons, are corrupt in morals and are betraying a high trust.

CORN FOR EGGS.

FRED GRUNDY, CHRISTIAN COUNTY, ILL.—I am aware that experts and poultry fanciers tell us that wheat is the best food for the production of eggs; but so far as my observation extends not one farmer in a hundred feeds wheat to his fowls. Quite often the screenings are fed to young chickens; but good wheat is generally considered too valuable for poultry food. This town is quite a poultry market, thousands of chickens and millions of eggs being sold here yearly to a party who has erected a large establishment for the handling of these products, and who keeps several men busy dressing and packing during the entire fall and winter months. Much of the produce is shipped direct from here to Boston, Mass. It is safe to say that more than nine-tenths of all the poultry raised hereabout are fed and fattened on corn and oats, with the seeds, insects, etc., they pick up about the yards and fields. The Plymouth Rock is the leading breed and such fowls bring the best prices. On a diet of corn, oats and yard pickings they lay a full average number of eggs per year. Early-hatched hens lay well in the fall, and, if warmly housed, most of the winter, and rest and molt in the summer. Some of our women poultry-keepers are quite expert in inducing their hens to lay during the winter. I have tried several different kinds of food for my own hens, and find that they lay as well on a diet of mixed corn and oats and what they pick up about the yard, as on anything. When allowed the run of the place they will eat only enough to keep them in good trim, even when the food lies before them in heaps. When yarded, however, I find it necessary to feed them only a limited quantity or they quickly become too fat and lazy to lay.

MORE ABOUT ROT IN POTATO "SEED."

"FARMER," BRIDGEWATER, MASS.—I should like those scientific men who do their farming on paper and who claim that our only hope of avoiding potato rot is to get the "seed" from localities where the tubers have not rotted, to note that which follows and which I stand ready to make oath to: It being a part of my business to grow choice strains of potatoes for seed, not only have I for years planted my own stock annually, but I have also received stocks yearly from Nova Scotia and the Islands where rot is seldom known, and many of my neighbors will plant only foreign stock. Now after years of trial and observation and hard facts, the rot is universal here and shows no partiality; hence experience teaches me that talk is cheap and facts cannot be disputed. No remedy has yet been discovered; no theory has been advanced with regard to rot, that is worthy of consideration by a practical farmer. The only way in which a fair crop of sound potatoes is secured in this section is by planting so early that the tops will mature and die a natural death on or before August 10th, the time the blight usually strikes. Of those raised under those conditions we are sure, but good potatoes cannot be obtained from late potatoes, and the fact that the blight arrived 15 days earlier this year, shows, of course, the above plan is not certain to guarantee success.

SULPHUR FOR POTATO SCAB; FERTILIZERS FOR POTATOES.

C. H. F., FORESTVILLE, N. Y.—I have tried the RURAL'S "sulphur remedy" for the potato scab and found it to be exactly as recommended—a success. I made a test plot by planting every other hill with a teaspoonful of sulphur sifted in planting time. The potatoes in the sulphured hills came out perfectly clean, while those in the other hills were badly scabbed. Fertilizers have been experimented with to some extent in this locality this season. Most of the experiments show the value of commercial fertilizers in a decided way.

Here are a few of the tests: A piece of buckwheat was sown with a standard fertilizer at the rate of 250 pounds per acre. In the center of the plot the fertilizer was shut off from the drill once through. At harvest time the unfertilized strip could be plainly distinguished for some distance. It was not worth harvesting while the buckwheat on either side was a splendid crop. Another man seeded a plot with oats, using fertilizers, shutting off the drill as above. The consequence was that on the unfertilized strip the oats were only half a crop and the seed did not catch, while that on the fertilized part was good. I have experimented some with fertilizer in my garden, and find that it surpasses all other kinds of manures in any shape.

POTATO DIGGERS.

F. A. B., RISING CITY.—I am interested in the reports of potato diggers in the RURAL of September 7, but can't fully agree with some of the writers in stating that they can get about all the potatoes by harrowing the ground. I use the Hamilton, O. digger and consider it the best that we have, and there are several other kinds used in this section, one costing $100. The trouble with the Hamilton digger is that it buries potatoes on each side and if the tubers are deep so that we have to run the plow deep to get under them, it buries lots of them in the furrow behind the plow. One year I ran the plow through the rows the second time and got a bushel every 25 rods. I think that if we could have some kind of a shaker attached just behind the rods, we would get more of the potatoes on the surface. Will not some of the Colorado subscribers of the RURAL tell us how they dig their potatoes, as I understand that they have such an arrangement to be attached to their potato plow. Potatoes in this section are good and there are lots of them. There is no sale for them as yet even at 15 cents per bushel. About every farmer has from 10 to 40 and some as high as 100 acres.

H. V., UNION COUNTY, N. J.—The Vermont Dairyman's Home, figured on page 537, has indeed a solid, home-like appearance; but there are several features the RURAL does not mention, which have such a familiar look that I cannot forbear calling attention to them. The most prominent is the fence. I suppose we must call it that for courtesy. It looks like the inclosure one might expect to find around a log-cabin in the wilderness, rather than around a typical Vermont homestead. Then the shrubbery within the fence! How many times have we seen farms where the owner not only indulged his taste for similar ornamentation in the grounds surrounding the house, but has extended the growth to all the fences on the farm, making a beautiful screen to hide the otherwise unsightly fence! In the illustration, the cattle have evidently been brought into the front yard to have their pictures taken, but it reminds me of cases where the cows or horses or other stock have been turned loose among the flower-beds "for a minute, just to get a bite." Unfortunately, dumb animals fail to discriminate and are just as likely—if not a little more so—to take a bite from the choicest shrub, or plant their feet in the middle of the flower-bed which the overworked housewife has tended with patient care. This is likely to cause a flow of language more eloquent than elegant, and to ause feelings which never should be occa-

sioned. The illustration is truly an "accurate" one in many respects, but, I must confess, to me there are several features which are far from what I consider "homelike."

S. R. Mc., West Salem, Wis.—The Jerseyman's article on horse-racing expresses just my views. The other day I was at our fair. About 20 race-horses were stabled on the grounds. I passed through and viewed these noble animals. Each horse was cared for by at least two men or boys. Their owners and backers were making bets, drinking whisky, smoking and cursing. I was invited to bet on any horse. The crowd who followed the race-course had all the marks of full-bred penitentiary stock, just what Jerseyman saw at the races. I then went out among the working stock and found them hitched to posts in open sheds fighting flies. There was no one to rub and curry them; their hides were marked with scars that were made by ill-fitting harnesses; they drew heavy loads, plowed and dragged and made it possible for their fine-boned swift brothers to get their living without much work. The race-horses got $800 in premiums and the hard-working, honest draft horses got just $8. They were hitched to a stone-boat loaded with two tons of stone. They pulled the load. The crowd who followed the draft horses were farmers and lumbermen, natives and foreign-born—a hard lot.

What Others Say

Work for the Agricultural Department and Agricultural Papers.—An advance slip from the Department of Agriculture gives results of an investigation regarding the composition of baking powders which "has been conducted under the direction of the chemist of the U. S. Department of Agriculture, Dr. H. W. Wiley."

If the department can legitimately make such investigations says the Farmers' Review, why was not flour examined instead of baking powder? The latter article has been sold under chemical analyses for years. The public had no fears in using it. They asked for no further information regarding its composition. Private experiment had satisfied each family as to which brand to use. The Government was not expected to investigate the subject, and now that the Agricultural Department has seen fit to do so, intense surprise has been aroused among the farmers, and rightly so.

Farmers and honest dairymen would be thankful, continues our esteemed contemporary, were the Department of Agriculture to investigate the vile combinations offered for sale under the name of cheese, expose the adulterations of such fraudulent productions, and incidentally assist the sale of pure dairy products. If baking powders are a character of goods which may be properly investigated and advertised by the Department of Agriculture, which presumably works for the interests of farmers, the latter would much rather have them substitute for baking powder investigations those of coffee, tea, sugar, mixed paints, vinegar, fertilizers, alleged woolen goods, and a hundred other articles vastly more important to them than baking powders and most probably much more impure.

The R. N.-Y. quite agrees with the spirit of the article above quoted and the Farmers' Review does good service in thus forcibly condemning such apparently needless work.

Turning from the shortcomings of the Department of Agriculture, the R. N.-Y. would feel pleased if the Review would heartily join it in condemning a culpable piece of business in which certain farm journals are engaged. The publishers, owners, proprietors or editors, as the case may be, of these papers are pecuniarily interested in booming certain Montana lands. They praise them up to the skies editorially, while their advertising columns are liberally given up to Montana advertisements. Now all this is being done while the readers of those journals are kept in ignorance of the fact that the editors or proprietors are cracking up the lands in which they own a share and for which they are stiving to obtain the highest price.

Against Poor Butter.—One of the most disagreeable experiences of farm life, says Henry Stewart in the New York Times, is to grow crops, rear cows, feed them, make butter, and be forced to sell it for a few cents per pound when the best market prices are as much as 25 cents per pound. In many places the quotations for farmers' butter are as low as six to 10 cents, while the best dairy and creamery brings 25 cents. This takes all the pleasure out of the work and makes it most disagreeable drudgery. A well-known dairyman, whose butter sells for 50 cents a pound, writing on this subject, says that he knows of many farmers' wives who from the milk of two, three, or five or six cows make butter that is better than the best creamery butter ever sent to market. But in every case these women are educated and intelligent, and read and study as well as practice the excellent methods which their mothers taught them, with the help of all the new improvements which have eased and simplified their work.

The best of butter may be made in any kind of churn. A jar even can be used; the old-fashioned up-and-down churn has made as good butter as the very best now made; but yet a modern improved churn is easier to use and more conveniently kept clean, and a clean churn is indispensable for making good butter. Churn regularly, not now fast and then slow, and do not leave the churn for an hour or two and then go back and finish it. The best butter is made in about 25 or 30 minutes. Look in the churn, if you do not understand the changing sounds of the splashing, and when the butter is in grains as large as wheat and peas, stop work; pour off the butter-milk and put clean cold water, with a little salt in it, into the churn and wash the butter until it is quite free from butter-milk.

Never touch the butter with the hands. Use a paddle made of an oaken shingle to lift it by or one of the ladles sold at the stores. Put the butter in a clean wooden dish, well rinsed with cold water; spreading it out as flat as possible, gashing it with a ladle, and sprinkle one ounce of the finest dairy salt to the pound of butter over it. If the butter lies loosely in the dish you need do no more, but if it is necessary, the salt should be mixed with the butter roughly, and the dish put away for 12 hours for the salt to melt slowly and mix with the butter. At the end of this time the butter is worked over by turning it with the paddle and squeezing it, taking care to avoid breaking the grain by plastering it, and when the salt is well worked in and the water well worked out, the butter should be made into neat rolls or small cakes, and put in a clean dish in a cool place where there is no dust. Then take a sample of the butter to a family in the village or a boarding-house, and try to get an order for a regular supply every week for the whole year, and get a fresh cow when it is needed to keep up the supply regularly every week. As one customer is found look for another; but, as soon as you can, get away from the store where the butter is exchanged for soap and dry goods and is put on a box of codfish near the stove until it is traded off or packed with a lot more of the same kind and is sent off and sold at 10 cents a pound for cooking and making pastry at the cheap hotels and boarding-houses in the cities.

"RAYS."

The pig crop, says the Breeder's Gazette, seems quite commensurate with the promised yield of corn, and in the face of prospectively large feeding operations the cholera question becomes once more an important consideration. That Dr. Billings has made material progress in the line of extending relief to infected herds seems reasonably certain, and as this is the first tangible assistance yet tendered by science to a long-suffering and much-humbugged swine-rearing public it is to be hoped that this matter of inoculation will be made the subject of most thorough investigation, as suggested by the late Government Commission. In herds where the disease has already made its appearance inoculation should most certainly be given a thorough trial.....

Make a note to try next year the Ignotum and New Jersey Tomatoes. The Prelude is the best very early tomato. Golden Queen is the best yellow. The Shah is one of the so-called potato-leaf tomatoes. The color is yellow and it is no smoother than the Mikado.....

The Ohio Farmer heard a horseman say, not long since, that more men had lost money in trying to raise fast horses than ever made money by either raising or owning them. This may be true. They lost money by attempting too much—not by breeding to good stock with sure, solid improvement in view.....

Sander's Horse Breeding says that very fast horses are not produced with certainty even by the most experienced breeders, with the best breeding stock to work upon, and the best trainers to develop them. This business affords enjoyment and recreation to gentlemen of wealth and leisure, with whom profit is a secondary consideration, and in such hands the breeding of horses for speed alone should be left. This is safe advice.....

The North-West says that any community which raises good draft horses will be found prosperous and progressive. When a half dozen or ten good teams are put upon the market and bring into the neighborhood from three to five thousand dollars, it helps everybody in it and drives the wolf from many a door.....

The Boston Transcript is of the opinion that the overhead check-rein for the horse is refined and steady torture, not for the strain backward of the neck, but because the animal cannot see the ground on which he is stepping. The swaying of his head from side to side is evidence of his trying to find relief.....

In referring to the practice of docking horses' tails, the Hartford Times says that the mutilation of a horse by chopping off his tail is no less a mutilation in reality than the cutting off of his ears, or taking out one of his eyes. In either case it is not only an atrocious act of cruelty to the horse, inflicting needless pain, but produces disfigurement. It is not only in bad taste, it is essentially barbarous. It belongs properly with the customs of tribes that flatten their heads, bore holes through their lips or noses, for the purpose of wearing a billet of wood suspended from such localities by a cord, and otherwise disfigure the features made by nature. In Massachusetts it is an offence punishable by fine and imprisonment thus to mutilate a horse, and it should be in every State ....

DIRECT.

——O. C. Farmer: "If such an elixir as that of Dr. Brown Sequard were among the possibilities and it would prolong life to the age of a hundred years, it is questionable if it would be a blessing. The very men whom we least need would be the first to try a barrel of it."

——Mr. Anderson at American Florists' Association: "About all the Hybrid Perpetuals that are really fall-blooming are Paul Neyron and Mrs. John Laing, no others being hardly worthy of being so called."

——Post-Express: Passenger: "Say captain, I'd like an egg for breakfast."

Captain: "When the ship lays to I'll try and get you one."

Passenger: "Oh, thanks. But if she doesn't?"

Captain: "Then you'll have to wait till I get the lay of the land."

——Garden and Forest: "Colonel Pearson writes that the copper sulphate mixture has again proved itself preventive of both rot and mildew even in this exceptionally wet summer. The grape-crop about Vineland is, however, almost a total failure, even where the clusters were bagged, and bagged early."

——The American Florist: "Mr. Craig tells us in his essay that catalogue cuts have been sent back to the engraver to have the flowers made larger and more of them on the plant, and we are convinced that catalogue cuts are frequently made simply from a description—that is the engraver is told to make a cut like one already in existence, 'changing it so that it will look different, but make the flowers larger and more of them, as this novelty is an improvement on that sort.'"

——Life: "The summer hotel is the doctor's fast friend. One of the conspicuous risks that poor people are spared is the hazard of travel-for-the-health. Many an ill-timed intimacy with an undertaker might have been indefinitely postponed if only the contracting party had been too poor to stir from home"

——Puck: "How has it come about that nearly 327,000 veterans and over 93,000 widows and children of veterans are to-day drawing pensions? It has come about through the pension agents. The business of these men began toward the end of the war. They were useful middlemen between the disabled veterans and the pension office. But the deserving veterans—nine-tenths of them—got pensions long ago."

——Garden and Forest: "The pea-weevil (*Bruchus pisi*) and the bean-weevil (*Bruchus fabæ*) can be destroyed by putting the peas or beans into a pail and covering them with water; if the water is warmed to about blood-heat all the better, but this is not necessary as cold water will answer. If the seed remain in the water from eight to 12 hours every weevil will be destroyed, as the cavity containing the insect is soon filled by the water absorbed by the seed and the weevil is drowned. This simple remedy, which is recommended by Professor J. W. Clark, of the Agricultural College of Missouri, is not only effective, but does no injury to the seed, and if the seed is not soaked until the day before planting, it will germinate more readily than before."

——New England Farmer: "Farmers cannot raise hogs to compete with cotton-seed oil, any more than they can make butter to compete with oleo."

——American Farmer: "No farmer can get to the head of the procession by hanging to the tail of a scrub cow."

——M. A. Cragin, in New England Farmer: "The rich man can afford two things—he can afford to do without silage, and he can afford to burn green wood. But the poor man can afford to do neither."

We also manufacture Self-Dump Rakes, Corn Shellers, Farm Rollers, etc. Send for Circulars and Price Lists. A. BLAKER & CO., Newtown, Bucks Co., Pa

THE
RURAL NEW-YORKER,
(34 PARK ROW, NEW YORK),

A National Journal for Country and Suburban Homes.

Conducted by
ELBERT S. CARMAN.

SATURDAY, OCTOBER 5, 1889.

PERSONAL.

"PRINT THE R. N.-Y., on a poorer grade of paper; give up your artists and use second-hand illustrations which can be bought for a song. Pay less for contributions. Then put down the price to a dollar, and you'll double its circulation."

Such has been the advice tendered us at various times by acquaintances and friends. Though thankful at all times for suggestions and advice, we have never been able to accept the above as worthy of serious consideration. To do so is and always has been discordant with our progressive aims and hopes. We have never felt quite contented unless we could feel at the end of every year that the R. N.-Y. has been better than ever before and more worthy of the support of a discriminating patronage.

Cherishing such views, encouragement from prominent men who cannot afford to bestow superlative praise indiscriminately, is peculiarly gratifying. The following lines are an extract from a note just received from W. Atlee Burpee, of Philadelphia, Pa.:

"The typographical appearance of the R. N.-Y. is grand and the paper excellent. * * * * I am glad that you have determined to stick to your plan of giving a high-grade paper. The RURAL already is head and shoulders above any competitor, and to maintain this rank rather than cater for the cheap trade is certainly a wise policy. Do you know that the 'Something-for-Nothing' policy of these cheap publications has almost destroyed their usefulness even as advertising mediums? You have a broad field if you can only maintain health and strength to work it with the same energy."

ASK any questions you choose, readers of the R. N.-Y. We or some of our many and widely-distributed correspondents will answer them as best we or they may. The Farmers' Club and its Discussions have grown to be one of the most useful and interesting departments of this journal.

MR. E. F. STEVENS, of Dickey County, Dakota, has the following to say, in a recent letter:

"I planted our field potatoes somewhat after the R. N.-Y.s trench system: result, I have potatoes to sell to my neighbors who planted theirs in the old way and hilled them up. Hurrah for the RURAL! I am about $30 or $40 ahead this year by taking it."

This note is printed for the benefit of those Western farmers who object to the R. N.-Y. because it is "printed too far East to do them any good."

"EDITORS who accept courtesies and perhaps pay from railroad companies and town-site syndicates, and, in return, make their editorial columns advertising mediums to boom the property of their patrons, are corrupt in morals and are betraying a high trust."

So says a correspondent on page 662, writing of the Montana boom. Chas. A. Dana says:

"Never print a paid advertisement as news matter. Let every advertisement appear as an advertisement—no sailing under false colors."

"THE RURAL NEW-YORKER is published too far East; it is not suited to Western farming!" This remark is often heard by our agents at the West. What do farmers who say this think of the following note?

"I did not believe a few weeks ago, when I sent for a sample of the RURAL NEW-YORKER, that I would care to take any Eastern paper; but I find that I cannot do without the RURAL, and so I inclose $2 for a year's subscription. I find everything in it worth recording, even in those lines that are foreign to my own special interests."

Rockford, Ill. J. B. U.

IT is very evident that the question of selling potatoes from fields where the rot has appeared is to prove quite an important one for farmers and seedsmen. The R. N.-Y. has given the statements of the purely scientific people, which are to the effect that it is unsafe to plant potatoes from fields where the rot has appeared. Practical farmers do not generally believe this; see for instance what "Farmer" says on page 662 Now, if the scientific side of the story be taken without question, it will be seen that potato sellers who have seed for sale, which was grown in localities where the rot has not prevailed, could rightly claim superiority for their seed potatoes and would be justified in demanding an extra price for them. Before farmers buy their seed, therefore, the R. N.-Y. wants this subject understood, and we shall print, within a few weeks, the best information that can be obtained regarding this matter, which we deem of considerable importance.

A FARMER in New Jersey rests in jail rather than pay a fine imposed upon him for selling milk which fell below the legal standard. The farmer claims that the milk came directly from his cow and that nothing has been added to it. If this be true, which is the culprit—the man or the cow? The New Jersey law requires that milk shall contain at least 12 per cent. of solids. This looks reasonable enough; it would seem that a cow giving milk with less than 12 per cent. of solids is not worth keeping, yet there should be no foolishness or carelessness about the official examination of the milk. The proportion of solids in milk from a given cow will vary considerably. A cow at the Wisconsin Station gave but 11 1-2 per cent. of solids in the first pint of milk drawn from her; while the last pint contained 19 1-2 per cent. Fright, change of feeding, a chill and other conditions may affect the cow so that a sample of her milk would give an entirely untruthful record of her usual performance; so that we see that carelessness in the enforcement of a milk law may do injustice.

SCIENTISTS are now discussing the desirability of a law which will create a very delicate legal difference. Some bee-keepers claim that their bees have been killed in their search for honey on fruit trees that have been sprayed with the Paris-green and water mixture for the coddling moth. It would seem as though a man ought to have a perfect right to use poisons on his own land to save his fruit from the ravages of insects. He merely uses the best known means of protecting his property. And it also seems fair that the bees should have a chance to gather the honey. Honey is a desirable article of food and its extraction takes absolutely nothing from the value of the tree or fruit. It would be a waste product if the bees did not utilize it. Now the scientists say that the only danger to the bee lies in spraying before the blossoms fall. After this point of growth, there is nothing left for the bee—it must work on other flowers. The coddling moth, however, so they tell us, can be killed after the bee has been satisfied, so the scientists would have a law, if need be, making it an offense punishable with fine and imprisonment to put poisons on one's trees before the blossoms fall. It can be readily seen that such a law would cause some very curious and delicate legal business. It must be said, in justification of those who desire some legal protection in this matter, that several cases are reported where bee-keepers have been nearly ruined by the early spraying of apple orchards.

THE Wisconsin farmers' institutes will open this year at Phillips, Price County, November, 19. These institutes are conducted in an eminently business-like way; in fact, it is probable that the Wisconsin farmers get more "institute talk" in the course of a year than do the farmers of any other State. Does all this talking do them any good? Well, the farmers claim that it does and they ought to know their business at least. There will be 60 institutes this year in two sets, both in session at the same time, so that a large territory may be covered. There will be five sessions during each institute, and a general programme has been arranged so that the same topics may be discussed at each institute. The following outline is given. The R. N.-Y. prints it because it may be useful for managers of other institutes.

First Session (for gentlemen only).—Stable management of cattle; principles of breeding in domestic animals; care of breeding animals; horse-breeding on the farm.

Second Session (all invited).—Clover, grasses and pasturage; corn culture; potato culture, grain raising; feeding questions—silage or otherwise.

Third Session (evening).—Educational topics.

Fourth Session.—Sheep husbandry, wool and mutton, early lamb-raising; swine-breeding and pork-raising; how shall we produce cheap beef?

Fifth Session.—Dairying; butter-making, cheese-making; gardening; fruit-culture; road-making, draining, noxious weeds.

Whatever is said regarding the value of such institute work to the farmer (the R. N.-Y. believes such work can be made of great value), the business management shown in conducting the Wisconsin institutes is most commendable.

$25.

TWENTY-FIVE dollars are offered by the R. N.-Y. as follows: Fifteen dollars for the largest and best shaped R. N.-Y. No. 2; $10 for the second-best. Description and weight should be sent in before November next. Those only who may be entitled to one or the other of the above prizes, *as judged by their own reports*, will be asked to forward the specimens to this office.

DEATH OF DR. G. H. COOK.

LAST Sunday George H. Cook, LL. D., Ph. D., State Geologist and Vice-President of Rutgers College, died unexpectedly at New Brunswick, New Jersey, of heart failure, at the age of 72. He was born at Hanover, N. J., in 1817; became a civil engineer in 1836, and graduated at the Troy Polytechnic Institute in 1839. He afterwards became a teacher in the Institute and was made "Senior Professor" or President in 1842. Later he became Professor of Mathematics and Natural Geology in the Albany Academy, and Principal of it in 1852, accepting the chair of chemistry and natural philosophy in Rutgers College two years later. Next year he became Assistant Geologist of New Jersey, and held the position for three years. Owing to his efforts the office of State Geologist, which had been for years in abeyance, was reorganized in 1864, and he was appointed its head. His work in this capacity was varied and of great importance. In the same year the State Scientific College was attached to Rutgers, and Dr. Cook, while relinquishing none of his other duties, became Vice-President of the college. He was the organizer of the State Board of Agriculture and was for a long time its secretary. In 1886 he became Chief Director of the New Jersey State Weather Service. He was also member of the State Board of Health and held many minor offices in the State, besides being an active worker in other directions. He was a member of the American Association for the Advancement of Science, and the author of many papers and addresses, some of which have appeared in the R. N.-Y. He received the degree of Doctor of Philosophy from the University of New York, and the degree of Doctor of Laws from Union College. A wife, one son and one daughter survive him. His life was active, useful and honorable, and his death is widely regretted.

WHAT ARE YOU GOING TO DO ABOUT IT?

ABOUT WHAT? Western dressed beef! We are speaking more particularly to our Eastern friends now, although Western farmers find very little to admire in the present state of affairs. Our correspondents tell their story forcibly and well. There is little that we can add concerning the effect of the trade in sections where the meat is to be sold. When we add that the rulers of this business are as greedy in buying as they are in selling, it is evident that Western farmers are but little better off than their Eastern brothers. Eastern farms are not going to grow up to brush pastures because of this trade. There are sorts of live stock that can be grown here at a profit and which will make the needed manure—sheep and early lambs, coach and carriage horses, hogs, "fed for lean," sold at special markets, first-class dairy cows, and, best of all, poultry. There never will come a time when the farms east of the Alleghanies will be beaten at the production of such stock. No, the R. N.-Y. has little fear for the future of agriculture in any part of this country. In "Snow-Bound" Whittier speaks of the schoolmaster:

"Born the wild Northern hills among,
From which his sturdy father wrung,
By rugged toil, a living scant,
Not competence, and yet not want."

That same rugged farm to-day planted in seed potatoes might produce a crop the value of which would fairly startle the old farmer. We merely speak of this as an illustration of the fact that there is a special product for every section. The man who is most successful in discovering this specialty is the man who succeeds. Agriculture is safe in spite of the dressed beef business. The germ of the matter is that a few keen, grasping business men have so manipulated an important business that no outside party coming in contact with the business is particularly helped, while all besides themselves are in some way injured. This is wrong. It is about this state of affairs that we ask—"What are you going to do about it?"

"I have tried the Rural's 'sulphur remedy' for the potato scab and found it to be exactly as recommended—a success. I made a test plot by planting every other hill with a tea-spoonful of sulphur sifted in at planting time. The potatoes in the sulphured hills came out perfectly clean, while those in the other hills were badly scabbed.—C. H. F., page 662.

BREVITIES.

A LIVELY dairy symposium next week.

THERE is to be a poultry show in this city on February 19 to 25, 1890.

FEED a few tomatoes to the cow if you want to see her enjoy a meal.

COME, Mr. Alfred Rose, let's have your apology now. Better late than never.

BE kind enough to weigh a potato just under what you term marketable size and let us know the weight.

THERE is a lively demand for nuts in this market. The sale of native nuts seems to increase from year to year.

WESTERN dairymen are talking about using the new "Butter Extractor" for the purpose of determining the value of different samples of milk brought to a factory.

"Break up the trusts. 'How can that be done?' By Farmers' votes. 'When?' As soon as the farmer will learn to vote for principles, not parties."—A. L. CROSBY, page 659.

"I AM a yearly subscriber for the R. N.-Y. and received the last number and lost it in an hour. I wouldn't take a dollar for it. Will the RURAL be kind enough to send me another copy? W. B. L.
Rochelle, Illinois.

Indust'l Societies.

CONNECTICUT STATE FAIR.

(RURAL SPECIAL REPORT.)

Very fine Grange exhibits; a good display of agricultural implements; a large cattle exhibit; on the whole it was the society's best fair.

THE 20th Annual Agricultural and Industrial exhibition of the Connecticut Agricultural Society was held in the Park and Town Hall in Meriden from the 17th to the 20th of September. The exhibition was the best ever given by the society, and it merited a much larger patronage than it received. As usual, the exhibition of the various Granges in the main building was one of the chief attractions.

The following Granges made exhibits in the building and the adjoining tent: Meriden, Cheshire, Mattabessett, (Middletown), Newington, Westfield, Berlin, North Haven, Middlefield, Wallingford, Percival and Northford.

The exhibition of Meriden Grange, No. 29, was made in the end of the implement tent. The feature of the display was a "Train of Plenty." It was a freight train with engine, cars and caboose complete. The cars, nine in number, were made of agricultural products. They were loaded with onions, beets, apples, watermelons, potatoes, etc. The locomotive was covered with seeds to give it the color of the original metal; the cab was made of corn-stalks and the tender was filled with ears of corn in imitation of fire-wood. The train was arranged on a semi-circular track 70 feet in length. In the center of this semi-circle were tables loaded with fruit and an arch of evergreens bearing the arms of the State designed of bunches of grapes and a column of flowers surmounted by a gray eagle. Altogether it was one of the most beautiful and striking exhibitions of farm products I have ever seen. Wallingford Grange showed a life-size figure of a milkmaid carrying a pail and milking stool and a very life-like figure of a cow. The milkmaid was made of pumpkins and various kinds of fodder. The cow was covered with oats and had a big squash for a bell. These figures attracted more attention than any other single exhibit.

North Haven Grange exhibited a windmill and clock made of flowers and seeds. Berlin Grange showed a model of a farm-house, barn and other outbuildings, with fields of grain, potatoes, etc. Westfield Grange had its table filled with 70 varieties of potatoes. Percival Grange showed a model of a plow about 10 feet long, made of fruits and vegetables. On the whole the Grange exhibits were highly creditable to the Granges of the State and were worth going many miles to see.

The implement tent adjoining the main building, was filled with a great variety of implements and carriages. Mr. Gale was on hand as usual and kept busy describing the various implements made by the Belcher & Taylor Company. Mr. W. A. Burr showed the Keystone implements and the E. W. Ross fodder cutters; also the Ideal feed mill and other kinds of farm machinery. The Shipman engine attracted much attention and favorable comment. The pomological exhibit in the hall in the upper part of the main building was well filled with fruits and vegetables. Mr. T H. Loomis showed some very remarkable specimens of the Eaton Grape. Mr. P. M. Augur, T. S. Gold and other well known fruit growers were on hand.

The cattle show was one of the best ever seen in New England. Between 500 and 600 head were on exhibition. The sheep and swine exhibits were large and interesting. The poultry tent was well filled; over 150 coops were shown. The industrial exhibition in the Town Hall was liberally patronized. The lower part of the hall was filled with the products of the local manufacturers, chiefly silverware and organs. The gallery was devoted to fancy-work, bed quilts, spreads, rugs and the like. The Pneumatic Symphony (self-playing) organs were the leading novelty in this department. These instruments would play a tune automatically, or the air could be played automatically, and an accompaniment played on the keyboard as on an ordinary organ. As the result of good management, the Connecticut State Fair grows better and better every year, but it needs the hearty support of the farmers of the State, and above all, it needs the hearty co-operation of the railroad company. The usual custom is for railroads to make the round trip to and from the fair grounds at the single fare rate. There is no good reason why the N. Y. N. H. & H. railroad should not do the same. J. H. G.

Field Crops.

RURAL POTATO REPORTS.

I RECEIVED my Rural New-Yorker Potato No. 2 about the middle of April. It was about the size of an English walnut and weighed just 1¼ ounce. Now the question was to get the largest return from the small amount of seed for seed next year. I carefully cut each eye out and laid them on a dish; then I cut all of the largest eyes in halves, making, in all, 13 sets. Some of them were no larger than a grain of wheat. I now took a piece of old onion ground very rich from former manurings, dug a trench 14 feet long six inches deep and 12 inches wide on the bottom according to the RURAL NEW-YORKER'S trench system. In the bottom of the trench I placed two inches of well rotted stable manure and incorporated it well with the soil.

On this I planted the sets and covered them two inches with soil. I then sowed over the surface of the trench at the rate of 500 pounds to the acre of fish guano and worked it well in with a rake. When the young plants made their appearance the leaves were about the size of a radish in the seed leaf. They looked as if they would be a failure for the want of nourishment from the small sets. I kept the soil stirred around them and watered them every few days until they got a start. After that they took care of themselves as well as any potato I ever planted with two to four ounce sets. The season being dry, they were thoroughly soaked with water twice during the growing season. On August 27 they were dug in the presence of three witnesses. The stalks were over 2½ feet tall and from one to 1¼ inch in diameter. The yield was 67 pounds of good marketable potatoes. The largest hill from one set was eight pounds nine ounces. In this hill grew the two largest potatoes. The yield per acre, allowing the rows to have been three feet apart, the usual distance of planting, and the sets one foot apart in the rows, would have been 1,220 bushels to the acre! When we take into consideration the size of the sets and the amount of stock seed—1¼ ounce—I think it safe to say the yield has never been beaten in field culture.

H. A. MARCH.

Skaggit County, Washington.

R. N.-Y.—This correspondent wrote us last spring just after receiving his little potato, that he had always supposed "the RURAL had more sense than to send out such a little potato by mail."

LAST spring I planted 10 pounds of Rural New-Yorker No. 2 Potatoes, cut to one eye, on 63 linear feet of land. No fertilizer of any kind was used and they were hoed but once. Last week I harvested from the plot five bushels and 59 pounds of the handsomest tubers I ever saw. There were but 9¼ pounds too small for market, and I offer a prize of $100 to any man who can find a deformed potato in the lot. One perfect tuber weighs 18 ounces. I showed one peck last week at the Wisconsin State Fair and the Rural No. 2 took the first premium for "Best Late Potatoes" against nearly 50 exhibitors of other varieties. Why should not the RURAL raise 700 bushels when mine yield at the rate of nearly 1,100 bushels per acre? D. B. H.

Delavan, Wis.

I PURCHASED last spring one pound of Rural No. 2 Potato and sprouted them in a hot-bed, setting the plants in a furrow on the edge of a field from which green rye had just been cut. They grew pretty well from the first; the bugs seemed to have no chance with them. They were dug about August 20, and carefully weighed. There were 18½ pounds of them, about 12 pounds of which were unmarketable. The heaviest hill weighed four pounds 4½ ounces. They are showing signs of rot. Potatoes in this section have rotted badly. C. M. T.

Stelton, N. J.

I PLANTED the R. N.-Y. No. 2 Potato about April 1. It was a diminutive, dried-up, wilted thing about the size of a hulled walnut and had a hole the size of a small peanut eaten in it by a grub worm. I cut it into nine pieces, one eye to the piece, and planted them in the garden in a trench, using dissolved bone phosphate at the rate of 200 pounds to the acre, as a fertilizer. The soil is a clay loam. The pieces were planted about 12 inches apart and only four of them grew. They had two hoeings and were dug August 10, and the four hills weighed nine pounds seven ounces, nearly all of a marketable size: one hill weighed two pounds 13 ounces, six potatoes being in the hill, the smallest one the size of a large hen's egg. The largest potato weighed 13¼ ounces. They are a fine lot of potatoes and I am well pleased with them and shall plant all of them next season.

Charlestown, Ind. J. D. K.

THE No. 2 Potato received last spring was about the size of a hulled walnut and from it I cut five eyes and planted them across the end of a beet bed in my garden, giving them about the ordinary attention. Owing to the cold spring they were very late in starting, but finally grew into fine, thrifty vines. About three weeks ago I dug them and got 64 tubers, weighing 11 pounds. There were several small ones and some as fine as I ever saw. They are beautiful potatoes and in every way a success.

Franklin, Ind. T. W. W.

THE Rural No. 2 Potato received was a little off shape. There were only four eyes. I planted them in good ground and dug them last week. I had 25 marketable potatoes; the largest one weighs 14½ ounces and the next largest 12½ ounces. I experimented with three other kinds of potatoes alongside of the Rural No. 2 and they are called first-class. They yielded well, but were over half rotten when I dug them and what I put away sound after I had dug them have rotted badly, but Rural No. 2 did not rot in the hill alongside of them and have not rotted since, and I am well pleased with them. I. S. P.

Stuyvesant, N. Y.

I CUT my Rural No. 2 Potatoes (I had two; a subscriber gave me his) into very small pieces. Most of the eyes were cut in two pieces, making 33 pieces in all. I planted them in a box and covered them about two inches deep, and placed them in a work-shop till they were up about three inches. I then dumped them out on the ground and picked out the sets. I planted them with a garden trowel, in a single row, in good garden soil, which had received no manure for years. I hoed them a little. Two of the sets refused to grow, which left me 31 hills. From these I have 51 pounds of potatoes. The largest one weighs 14 ounces, but is not smooth. The next largest 13 ounces, and the next 12 ounces. The last two are smooth. The largest 10 weigh six pounds and 14 ounces. With the exception of four or five hills, the potatoes are very fine. I would not sell the lot for $5. S. J. E.

Canton, Ill.

MY RURAL NO. 2 potato I planted about April 15 in a clay soil where a strawberry bed had been several years. No fertilizers were used. The potato was cut into nine pieces with one eye each, eight of which grew. The vines were very small all summer and did not seem to thrive very well, but I dug them September 6 and found 40 nice, smooth potatoes, which weighed 13 pounds; 31 were of good marketable size, nine being smaller than a hen's egg and weighing half a pound.

Potatoes are a good crop here, and are worth only 25 cents per bushel now. Late ones are not yielding quite as well as expected. Have not heard of their rotting any yet. D. W.

Wolcottville, Ind.

I PLANTED the Rural New-Yorker No. 2 about April 15th. It was not as big as an ordinary sized hen's egg, and only had six eyes. I cut it into six pieces and planted them 10 inches apart in a drill three inches deep. I did not use any fertilizer; but the ground was watered three times with liquid manure. They were dug the first week in September and yielded 12 pounds. There were 25 potatoes; two were about the size of marbles and the rest were of good size, the largest weighing one pound; while three or four would go about three-quarters of a pound. The largest potato is a little coarse, but is not knobby. Taking the size of the sets into consideration, it is the heaviest yield I ever saw.

W. MC A.

Port Hammond, British Columbia.

THE Rural New-Yorker No. 2 sent me last fall weighed just 1⅛ ounce. On May 7, I cut it into seven parts, planting them—one eye to a piece—in a trench and covering them four inches deep, each eye about 12 inches apart. The condition of the land was no more than an average of the whole field, which was fairly good. I used two pounds of Bradley's fertilizer and two ounces of sulphur and no other dressing for this potato. I harvested the tubers September 7, and got 47 potatoes, all weighing 10½ pounds, or 168 ounces. The largest weighed 13 ounces; 40 of them were of good size suitable for table use; seven others were smaller; all were white and clean. There was no rot or scab. I have tried some of them boiled and baked and find them fully equal to the Snowflake or Early Mayflower the two finest varieties ever raised in New Hampshire. S. S. L.

Meredith, N. H.

THE potato I received last spring was about the size of a very small hen's egg. I cut it into 12 pieces, one eye to a piece, and planted them in new prairie soil about one foot apart. All the working they got was a little forking of earth to them with a manure fork twice. I dug them September 11 and got for my labor 48 tubers free from rot, weighing 10 pounds; six were small, 42 of fair size, the largest weighing one pound. Thanks for the potato. G. K.

Bradshaw, Neb.

Woman's Work.

CONDUCTED BY EMILY LOUISE TAPLIN.

CHAT BY THE WAY.

SYDNEY SMITH says: "Never teach false morality. How exquisitely absurd to teach a girl that beauty is of no value, dress of no use! Beauty is of value, her whole prospects and happiness in life may depend upon a new gown or a becoming bonnet; if she has five grains of common sense she will find this out. The great thing is to teach her their proper value, and that there must be something better under her bonnet than a pretty face, for real happiness in life." The wise prebend spoke with his usual common sense when he made this declaration. There is no doubt that we women are always first judged by our looks, and we strongly influence others by these external qualities. But not only mere prettiness must be taken into account. Good temper, good sense, and social tact, combined with a talent for tasteful clothes, will cause a plain girl to outshine a pretty one, if the latter possesses no striking qualities beyond her prettiness. Very often the most attractive girls we know possess little actual prettiness, but somehow they give the impression of beauty. Personal beauty is God given, and we must recognize its powerful influence, while remembering the less evanescent graces that should accompany it.

* * *

TALKING of prettiness, we recently read an interview with a so-called beauty doctor, a woman whose business it is to preserve or improve the good looks of her patrons. Judging from her words, we all ought to be good looking; of course, she does not promise to make irregular features straight, or alter radical defects, but she gives many suggestions for improvement. Her three essentials are fresh air, exercise, and abundant soap and water. Many women do not believe in the use of soap upon the face, but eminent medical authorities say that skin disorders are often caused by impurities which the use of soap would prevent. Once a day the face should be washed with abundance of good soap. It is a good plan to wash the face first with warm water—then rinse with cold; this hardens the skin, and lessens the risk of roughening on exposure to cold. This "beauty doctor" speaks in terms of reprobation of those women who boast that water is never used to cleanse their faces, and rightly too. Surface dirt may be removed by such unguents as glycerine, vaseline, or the like, but we certainly cannot consider such people clean.

* * *

WE have often spoken of cleanly women whose cleanliness does not extend to their hair, and this is a very frequent fault. Unquestionably, the hair should be properly washed every 10 days or two weeks at the farthest, although it is a tedious and troublesome process. When allowed to go without washing for any length of time it is not only unclean: it loses its natural gloss, which can never be replaced by the greasy

luster succeeding it. It should be well washed with some good soap, rubbed thoroughly into the scalp, and then as thoroughly rinsed; a drop of ammonia in the water will be found an improvement. It must be well rubbed with towels, the bang, if worn, adjusted in its proper place, and the hair dried, either in the sun, or in the vicinity of a fire. If very dry a little vaseline may be rubbed into the roots, but not on the hair itself. Borax, though often used in washing the hair, is not advisable, rendering it too dry and brittle. Some women think that the proper way to dry the hair is to rub it gently between the bare palms of one's hands, but this is a very tedious process. Certainly it is always a convenience if one can get a second person to dry one's hair, and to wash it, but this is not always possible. As for hair revivers, it is well to leave most of them alone, but sometimes simple remedies will promote growth or prevent it from falling out. For one of these, which has often done good service, take five cents' worth ofbitter apple, and put it to steep in half a pint of rum. Let it steep for three or four days, then rub the liquor into the scalp daily with a bit of flannel. It seems to invigorate the scalp and promote the growth of hair; it is certainly a harmless remedy.

WASTED ENERGY.

J. H. G.

THE most approved cannons (the Italian model of 1879) convert but 17 per cent. of the total energy of the powder into work. An ordinary steam engine under the most favorable conditions converts into work less than 10 per cent. of the power represented by the coal. Man considered as a machine is vastly superior to the results of his handiwork: for when he applies his labor to a definite object he converts 22 per cent. of his energy into work. But while he is superior to a machine in the results of his labor when directly applied to a definite object, he is vastly inferior to it, in that by far the greater part of his labor is wasted altogether. This waste of energy is to me one of the most lamentable things in the world. I am conscious of it and so are you. We read the works of great authors, Homer, Virgil, Dante, Shakespeare, Milton, and what is the result? We have simply wasted our energy in ascending a literary hight which the pressing duties of life will not permit us to maintain; we study music, wasting energy which would make us successful in almost any sphere in acquiring the rudiments of an art which is virtually valueless both to ourselves and the world. A man gets a mania for politics and goes into it. He gets the nomination for some office; he wastes energy enough to plant a whole farm only to learn that his opponent is more popular than himself. One or two such experiences will usually shut off the waste of energy in that direction, and so on *ad infinitum*. We are ever striving to appear what we are not, and cannot be. I have often thought what a blessing to mankind an instrument would be which would accurately measure us—physically, mentally, and spiritually. How much misdirected effort, ungratified ambition—unrealized heart longings it would save us.

In the absence of any way by which we can determine how to so exert ourselves as to obtain the best results, it may not be unprofitable for us to consider for a few moments some of the sources of waste energy.

One of the most prolific causes of waste energy lies in our system of education. We spend the best part of our lives in fitting ourselves for a sphere into which we are destined never to enter. It is a rule rather than an exception that men, and women too, have less education or what passes for education at 30 years of age than at 20. Almost all the instruction obtained in early life is forgotten as we come to life's more urgent realities. In other words, we spend the best part of our lives in fitting ourselves for what we are not and cannot be. We cultivate the unreal and sacrifice the real. Let us take up one of the commonest mistakes of life as well as the most radical source of waste energy—the waste of waiting for opportunities. The desire to say some great thing has prevented the utterance of many a wholesome word, and anxiety to accomplish some wonderful work has crushed in the bud many an humble deed of exceeding grace and sweetness. We wait for something to turn up instead of turning something up.

"Every claim of duty, the employment of each minute, the daily vexations or troubles we are called upon to bear, momentary decisions that must be made, the casual interview, the contest with sin or sorrow in that every-day dress, all these, and many others as small and as constant, are the real opportunities of life. These we are continually embracing or neglecting, and out of them we are forming a character that is fast consolidating into the shape we give it, for good or for evil. Those who are waiting for important crises, overlook the great fact, and drift aimlessly along the current that seems to them so placid as to require no effort, but which is bearing down with fatal swiftness all those who do not energetically breast its waves and resist its power.

There are doubtless, in the lives of all, great crises, large opportunities, marked epochs. But he who waits for them will be ill prepared to meet them when they come. The strength to pass through them nobly and worthily, must have accumulated, little by little, in the patient and resolute struggle of every day life. He who fails here will surely fail in greater things. If we neglect our little opportunities, we shall lack the power to embrace the larger ones. Chances are lying open to us every moment of our lives. We need not wait for them, they are waiting for us to embrace them. If we watch through a single day we shall doubtless discover hundreds of opportunities of both doing and receiving good, that we have perhaps hitherto passed by in indifference, and by diligent assiduity in seeking for and embracing these, we shall be prepared to encounter the fiercer storms of life that await us, or to take advantage of the future that may open for our good."

Sydney Smith says: "Let every man be occupied in the highest employment of which his nature is capable, and die with a consciousness that he has done his best."

"Blest work; if ever thou wert cursed of God what must his blessing be." You are waiting for opportunities—wait no longer—there is work to be done—work to be done here—in church service, in Sunday school, in society—for society is but the aggregate of individual effort. The success or the failure of society is but the aggregate failure of its individual members. We must accept society as evidence of individual characters and work for it accordingly. Above all remember that any criticism of a society of which you are a member is but another way of finding fault with yourself.

"Let us then be up and doing with a heart for any fate.
Still achieving still pursuing, learn to labor and to wait."

"If thou can'st plan a noble deed,
And never flag till it succeed.
Though in the strife thy heart should bleed,
Whatever obstacles control,
Thine hour will come; go on true soul,
Thou'lt win the prize, thou'lt reach the goal."

ONE OF GRANDMOTHER'S TALKS.

MRS. S. H. ROWELL.

I DECLARE, it does seem real good to get back home once more! No, I do not enjoy city life! I do not believe I drew a real, good long breath all the while I was in Judge Gibson's house! It was so close, and smoky, and smelled so strong of gas and soot that I don't wonder folks are sickly, and the children are feeble and puny. It is more of a wonder that people there raise as many babies as they do, than that so many die! What on earth people huddle into cities for, is more than I can tell! They die of starvation, and want of breath by hundreds in the hot weather, and freeze to death in cold weather. There are lots of homes in the country where folks could find work enough to do, and have pure air to breathe, and trees and grass and posies. Oh, dear! it is strange how people will leave pleasant homes to go to live in a city!

I suppose Alice Gibson does enjoy it. She has a nice house, and fine furniture, and a grand turnout when she goes to ride, but she is not a happy woman, she is pale and looks so tired all the time, and her children are poor sickly sufferers. She took me up to the grand cemetery one day for a ride. She has more children there than she has in her elegant house; and she will have more of them to carry there, for I never did see such a weakly set as the Gibson children are, in all my life! As true as I am alive, I never heard a good hearty laugh from one of them all the four weeks I was there. They crept around the house like so many mice; they are all crooked and go stooping about, as though every step hurt them, I don't believe one of the children are real glad they are alive; they don't have any fun, but all they care for is to eat cake and candies, I should suppose their mother would know better than to give them such stuff. It spoils their appetites, and gives them the toothache. A good dish of bread and milk would be so much more wholesome for them than pound cake and bon bons; I never thought Alice would make such a woman, but you cannot tell how girls will turn out. She was a real smart business girl, and if she had married a poor man, she would have been a happier person than she is now. Yes, and she would have been a better woman too, for she would have had something to live for and to do in the world, and she would have brought her children up to be useful and do something with their lives. Ah well! I gave the Judge and Alice a piece of my mind before I came away, about the way they were raising their young ones; and the Judge looked as if I was wild, when I told them what I thought, but he said, perhaps I was right about it, that he knew there was a mistake somewhere, for their children were all invalids, and he never could understand why it was so, for both he, and Alice, were healthy, when they were young. Yes, but you were raised on good plain food, and allowed a chance to run in the dirt and grow up strong and active. Very true, very true, he said, and they will find it so in the end.

GOLDEN GRAINS.

SMILES reminds us that energy enables a man to force his way through irksome drudgery and dry details, and carries him onward and upward in every station of life.....

Not once or twice in our rough island story
The path of Duty was the way to glory.
—*Tennyson.*

HORACE says that he who idles away the time for which he is paid, does himself greater injury than he does his employer, for he is erecting an insurmountable barrier between himself and progress.—N. W. Penhurst. Life has given nothing to mortals without great toil.....

DR. JOHN HALL says we should keep clear of personalities in general conversation. Talk of things, objects, thoughts. The smallest minds occupy themselves with personalities. Personalities must sometimes be talked, because we have to learn and find out men's characteristics for legitimate objects; but it is to be with confidential persons. Do not needlessly report ill of others. There are times when we are compelled to say: "I do not think Bouncer is a true and honest man;" but when there is no need to express an opinion, let poor Bouncer swagger away. Others will take his measure, no doubt, and save you the trouble of analyzing him and instructing them. And as far as possible dwell on the good side of human beings. There are family boards where a constant process of depreciating, assigning motives and cutting up of character goes forward. They are not pleasant places. One who is healthy does not wish to dine at a dissecting table. There is evil enough in man, God knows; but it is not the mission of every young man or woman to detail and report it all. Keep the atmosphere as pure as possible, and fragrant with gentleness and charity.

We would do well to heed some of the maxims of the Talmud. It says that we should love our wife like ourself and honor her more than ourself. Who lives unmarried, lives without joy, without comfort; without blessing. He who forsakes the love of his youth, God's altar weeps for him. It is woman alone through whom God's blessings are vouchsafed to a house. She teaches the children, speeds the husband to the place of worship, welcomes him when he returns, keeps the house godly and pure, and God's blessing rests upon all these things. He who marries for money, his children shall be a curse to him.....

He who hath a virtuous wife hath a greater treasure than costly pearls. She openeth her mouth with wisdom, and her tongue is the law of kindness.....

Domestic Economy

CONDUCTED BY MRS. AGNES E. M. CARMAN.

"AT HOME" ON THE FARM.

ANNIE L. JACK.

"COME, stir the fire, and close the shutters fast, let fall the curtains, wheel the sofa round"—for autumn has come—and once more we gather around the hearth fire and think over the summer past with its many pleasures, and its disappointments as well. Crowded into the housekeeper's daily routine are many things at this season of the year—and happy is that pantry when the stores are all safe for winter use, for I was lately told the sad experience of a young girl who put up the summer fruits while her mother was absent in Europe. An enterprising younger brother on the lookout for jam made the discovery that the jars were "fizzing" and that the floor was covered with the fermenting fruit. Poor little housekeeper! She will give a good deal more care next time to the security of her winter's supply.

Just now "around the house" we are troubled with apple thieves, and it is a pity some law could not be put in force to punish such offenders just as people who steal apples from a fruit store in the city are punished. Where's the difference? Speaking of this, we were lately both amused and annoyed by petty theft in a new direction. The Provincial Experimental Farm at Ottawa sent me to be tested some new varieties of grain, which I gave to one of the boys who is chiefly interested in grain farming. At the season of ripening we found on several occasions some of the city people who summer here trampling the grain, and carrying away sheaves of the oats and barley for their parlor decoration and Christmas work, without as much as saying: "By your leave." My boy, who is a bit of a philosopher, wondered how it would do to pilfer the same value in any of their stores and trample on the goods—and thought it unfair that the rule wouldn't work both ways.

It has been a poor season for bees here, the wet weather making their food scarce. I was surprised to be told that so much spurious honey is manufactured, glucose entering largely into the composition. The bees give liberal weight in the pound sections, for, when full, they are sure to be over weight. In many country places beehives are an article that thieves delight to honor, and it is not at all uncommon to find one's apiary a hive or two short some autumn morning just as now and then the hen roosts are visited. But the other day (a Sunday too) an innocent craft came up the river, a simple row boat with four occupants, and in open daylight took away a bag full of sweet corn from a field quite near a house. The fact that the owner went to church while the public thus poached on his grain, was rather a poser as to rewards and punishments.

The RURAL'S Sunday evening talks to us are fresh, original and delightful; we enjoy them very much. In most country places there is a great lack of a good social element, both for week days and Sundays. If one does not want to join with those who live only for present pleasure, there is little chance of social life in a scattered community, and the Sunday evening talks would be a good institution to bring people together, and develop the best that is in them—often to mutual advantage.

IN every work that he began.....he did it with all his heart and prospered.—2 Chron., XXXI., 21.

ODDS AND ENDS.

ONE of the newest fads is making bed spreads, bureau covers, etc., of heavy butcher's linen. A very pretty spread may be made with a border of daisies in white and yellow. In the center have a cluster of long-stemmed daisies, with fluffy grasses and oats or wheat mingled with them. The edges are fringed out and knotted. If one prefers there may be a double row of drawn-work above the fringe—through these run in and out narrow pale-blue ribbon. Forget-me-nots also make a pretty design for a spread. Use wash floss for the embroidery.

* * *

IN late years it has become very fashionable to devote much time and thought to

Miscellaneous Advertising.

When Baby was sick, we gave her Castoria,
When she was a Child, she cried for Castoria,
When she became Miss, she clung to Castoria,
When she had Children, she gave them Castoria

the decoration of the beds. The old-fashioned white Marseilles spread is rarely ever seen now—that is, in "Fashion's Kiddy Circle"—while those of silk damask, cretonne, embroidered linen and other fabrics take its place. Pretty and inexpensive spreads may be made of wide Swiss muslin, with polka dots, lined with some soft, pretty silesia, and trimmed all around with a fall of soft lace. A bow or two to correspond with the lining will also add a finishing touch. Madras cloth also makes nice spreads.

Some of the beds gotten up in these styles look beautiful, but to my country-loving mind there is nothing so pretty as a pure-white spread, and neat hem-stitched pillow slips.

* * *

IF you haven't much spare closet room make a shoe box for each bed-room. Shoes lying about make a room, otherwise neat, look very untidy. A soap box makes a nice receptacle for this very purpose. Make a box-plaited flounce all around the box. Cushion the top with cotton-batting, or hair if you can get it, and upholster with cretonne. You may add castors to the bottom so that it may be easily moved. This also makes a nice seat to use while putting on one's shoes and stockings. Line the inside of the box either with silesia, muslin or paper.

* * *

I MADE a call the other day, where I saw the following fad: it may not be new to some of you, but it was to me. The lady had two pillows covered with some beautiful Persian-looking material in her parlor. They were thrown carelessly on the floor, one on top of the other—to be used in lounging about. They looked very pretty and I think for a bed-room or a sitting-room they would be very handy indeed.

* * *

WINDOW draperies and door-hangings are made nowadays mostly of light fabrics such as Madras, Chinese cretonne, etc. Some of them are very pretty, indeed. We, however, prefer heavy materials for the doors, though lighter ones do very nicely for the windows. The heavy ones at the windows are apt to make the rooms seem gloomy.

* * *

DON'T forget to fix some boxes or pots of plants for your windows during the winter. Something fresh and green within, while all outside is dull and bleak, brightens up the home wonderfully. A pretty fernery (made as described in the RURAL some time ago) would be just the thing for the sitting room. Ferns require very little attention. They are used to the shade, so do not droop for the sun as some plants do. All that is necessary is to keep them moist; they require considerable watering.

DORA HARVEY VROOMAN.

THEODORE WORES in The Century says that an utter absence of sham, a perfect freedom from all affectation, constitutes one of the most admirable qualities of the Japanese. They show no false or veneered front to the world, and their lives and actions are free and natural. The beauty of their homes lies more in the interior finish than in a showy outside, and the most beautiful rooms are generally those facing a garden in the rear. Even in their dress they are consistent, for the lining of their gowns is often of a more expensive and finer material than the outer stuff. A Japanese friend once confided to him that although there was much that he admired in the appointment of American homes, all this furnishing and decoration confused him. He did not know if he was right, he ventured to say, but it seemed to him that there was too much of everything; in fact, they seemed to him more like curio shops than living rooms. In this respect the difference between the Japanese and ourselves lies in the fact that whatever one may find in their houses, beautiful as it may be, is for use as well as for ornament. Its beauty, in a great degree, lies in its utility, whereas with us half of the objects that decorate our crowded rooms serve no useful purpose.

AGREEMENT.

MY father has taken the RURAL for several years and we are all greatly interested in its pages. When it came this evening I could not resist the temptation of writing to say that I entirely agree with "A Man" in his views of Charity Sweetheart. In fact I have never believed that Charity was a real girl, but a myth. I have always believed that somebody else wrote under that name the letters purporting to come from a farmer's daughter for the purpose of showing up the ways of *some* farmers and their sons, for I cannot understand how any girl could write for publication about her home affairs, her father and brother, as she has. However, myth or reality, her letters are queer mixtures. In my opinion, a good, honest farmer's son is way ahead of the town-polished young man.

A TRUE COUNTRY GIRL.

A LADY writer in Mail and Express counsels most wisely when she advises young girls to be careful about their conduct towards the young men that they meet. She says: "I will take it for granted that you are pretty, and perhaps a little gay and thoughtless as well. If I have pictured you correctly, remember that to be thoughtless counteracts being pretty. You know the proverb—'As a jewel of gold in a swine's snout, so is a fair woman without discretion.' And no modern proverb vender or mender said a truer thing. Do be discreet; do not think that young men are the only delightful people in the world, or act as if you thought so. Keep them at a proper distance; no man likes or respects a girl who runs after him, defers to his opinion, lets him say rude things to her, and take little liberties of speeech or action. Again, don't go out driving or walking or sailing alone with any young man. Perhaps you will tell me that girls all do it. Not well-bred girls, my dear; if you have no real chaperone, take another girl with you. Half the scandals and tragedies of women begin in their carelessness about this very thing. And over all, do be most particular about young men with whom you associate. Avoid 'fast' men as you would lepers. Men who are dissipated are inherently low; no matter how rich, how handsome, how highly placed in what is called society, such men are no associates for a pure young girl. You do not know anything about their real lives and characters, and they know you do not; they take advantage of your natural and lovely innocence, and admire it, though they know themselves they are not fit to touch the hem of your dress even. I must say something about your clothes. Don't be too fine; simplicity and exquisite fresh neatness are more attractive in a girl's costume than any extravagance of fashion or costliness of material; but even the plainest dress may be made flaunting by its immodest style. Again, be just as careful with what young women you are friendly as I would have you to be about young men. A girl is always judged by her friends; keep civilly aloof from the 'fast,' the slangy, the giggling girls you will too surely meet. Choose your company more carefully than your dress, for your friends are the true index of your moral and mental status. Nothing can ever retrieve the mistakes you make now in these respects; you are now 'making history'—the history of your life. God never made among all the exquisite things of creation a more lovely, enchanting, exquisite, admirable creature than a fresh, pure, charming young girl, full of unselfish thought for others, gentle, gracious and spotless. Not the milk-white and stately June lilies are so radiant in their stainless candor as such a girl; no tropic blossom vies with her health-colored face beaming with the light of the sweet soul within her; she is the flower and crown of humanity."

MINNIE'S WEDDING FRUIT CAKE.

ONE pound, good weight, of sugar, 10 eggs, one pound, good weight, of flour, one pound of butter, three pounds of raisins, three pounds of currants, one pound of citron; mace, cinnamon, cloves and allspice two and a-half tea-spoonfuls each, one-half cup of molasses. Bake slowly.

APPLE COTTAGE PUDDING.

BUTTER a pudding dish and cover the bottom an inch in depth with sliced, tart apples. Select those that cook quickly. Stir together one cup of sugar, one-half cup of butter, one egg, one cup of sweet milk three cups of prepared flour, or plain flour with two tea-spoonfuls of baking powder sifted through it. Pour this over the apples and bake. Eat with the following sauce: Three cups of boiling water, one cup of sugar, three table-spoonfuls (level) of corn starch dissolved in a little cold water, butter the size of an egg and the juice and rind of a lemon.

PUFF PUDDING.

ONE quart of milk, four eggs, a little salt and 14 large table-spoonfuls of prepared flour. You can substitute flour with two heaping tea-spoonfuls of baking powder for the prepared article. Beat the eggs thoroughly, add the milk then the flour. Bake in a quick oven. The mixture should not be over an inch and a-half in depth in the pan when put into the oven. It will be very light when taken from the oven but will fall at once. This is as it should be. Eat with the above sauce or sweetened and flavored cream.

APPLE CRUMB PUDDING.

PUT a layer of bread-crumbs in the bottom of a buttered pudding dish, then a layer of sliced tart apples sprinkled with sugar, then crumbs and apple until the dish is almost full. The crumbs should be last. Cover and cook an hour. Eat with the sauce used in "Apple Cottage Pudding," or sweetened cream.

MISS LIZZIE VOORHIS.

CREAM PUFFS.

HAVE one-half pint of water boiling. Put in two-thirds of a cup of butter and while it is boiling put in one and a-half cup of flour. Let cool a little, add five eggs well beaten. Beat all together well. Drop a table-spoonful at a time on a hot tin and bake quickly. The filling, a rich corn-starch with eggs. Flavor.

SPONGE CAKE WITHOUT BAKING POWDER.

TAKE the weight of 10 eggs unbroken, the same weight in sugar, the weight of five eggs in flour. Beat the yelks of the eggs very light, then add the sugar and beat five minutes, add the whites of the eggs beaten stiff and stir in the flour gradually, thoroughly. Flavor with essence of lemon. This makes three good-sized loaves. Bake half an hour in a moderate oven. The oven door must not be opened till the cake is nearly done or it will be likely to fall.

CORN MUFFINS.

ONE quart of Indian meal, three beaten eggs, one table-spoonful of lard, one tea-spoonful of soda, one tea-spoonful of salt. Mix with butter-milk.

CORN STARCH CAKE.

THE beaten whites of six eggs, two cups of sugar, three-fourths of a cup of butter, one cup of milk, one cup of corn starch, two cups of flour, two tea-spoonfuls of baking powder. Flavor with vanilla.

ANGEL'S FOOD.

SOAK well a half box of gelatine in one-half pint of milk. Heat three pints of milk, add a cup of sugar, beaten yelks of three eggs then add the soaked gelatine and the whites beaten stiff. Flavor and turn into a mold.

A GOOD COUGH MIXTURE.

ONE ounce each of hops, horehound and wild cherry bark. Put in three pints of water and steep to one quart, then add one-half pound of brown sugar, one-half pint of Jamaica Rum, one gill of tar. Let stand until cold. Strain and bottle.

News of the Week.

HOME NEWS.

SATURDAY, September 28, 1889.

A STOCK company, it is said, has been formed in Todd County, Kentucky, and Montgomery County, Tennessee, for the purpose of holding fairs. Every one connected with it is reported to be colored, and "no white folks need apply."..... The Detroit International Fair and Exposition was opened Tuesday by Governor Luce. The grounds cover 70 acres and the buildings fully 25. Every foot of space is occupied with exhibits from all parts of the United States and many parts of Canada.....Elizabeth S. McClellan, mother of the late Gen. George B. McClellan, died at Philadelphia the other day, aged 90..... ..E. Burd Grubb, the new Republican candidate for Governor of New Jersey, owns the finest lot of Game cocks in the State, so that there'll be no scarcity of splendid roosters to celebrate his triumph—should he secure one..... A bronze statue of General Grant, nine feet high, upon a polished granite pedestal of equal hight. was unveiled at Fort Leavenworth, Kansas, the other day, amid the rejoicings of the citizens of Leavenworth, who took a general holiday. This is the first notable public monument to the Hero of Appomatox..... ....Postmaster-General Wanamaker has caused the arrest of Dr. W. E. Reid, a medium of Grand Rapids, Michigan, for sending Spiritualistic messages for money through the post-office, on the ground that he was using the U. S. mails for fraudulent purposes. The Spiritualists throughout the country have raised a large fund for the defense of the accused, on the plea that his arrest is an outrage on the religious belief of a large body of citizens.. Reports from Iowa and Kansas say that large numbers of thrifty but bibulous Germans are leaving both States on account of the enforcement of the Prohibition laws. The "exodusters" are generally making their way to that paradise of the "wets," Texas. The same cause, it is alleged, has greatly checked Teutonic immigration..... .....The other day the Tennessee Coal and Iron Railroad Company, as the lowest bidder, leased the convicts of the Tennessee Penitentiary for six years for $100,000 per annum, in spite of the general outcry against this relic of slavery and semi-barbarism.....Two members of the Common Council of fire-swept Spokane Falls and one of its policemen have been arrested charged with misappropriating the funds and supplies contributed for the relief of the sufferers. What with fussy and frivolous incompetence at Johnstown, and disgraceful official "boodlerism" at Spokane Falls, on whom can public charity rely for the relief of the victims of any great disaster?..... The International American Congress will be organized in Washington on October 2, and the members, as guests of the nation, will leave that city on October 3, for a tour of inspection through the North and West, returning on November 12. During the winter they will also visit the South. Considerable anxiety is expressed in several European countries as to the possible effects of this convention of representatives of all the independent States of this Western Hemisphere. It is hoped here and feared abroad that it may lead to a great increase of trade between this country and those south of it, which would cause a corresponding diminution of trade with Europe, which at present almost monopolizes the trade with Mexico, the West Indies and South America. There is some idea of forming a "customs union" or "zollverein," establishing a liberal measure of reciprocity between all the States on this side of the Atlantic. This would place all American countries, in their trade relations with each other, on much the same level on which the various States in our Union now stand, so that each in dealing with any other would have a great advantage over all "outsiders."..... .....The City Directory of Johnstown, Pa., which has just been issued, gives the death roll as 3,500, which is believed to be a close estimate. That worthnothing, do-nothing Flood Commission still clings fast to $1,600,000 of the charitable contributions for the relief of the sufferers, many of whom have died or emigrated since the disaster; while many more have worked so far ahead as to be in little need of a helping hand now ....Ex-Commissioner of Pensions, Corporal Tanner, is still without an office, and his old office is still without a head. Col. Warner, of Kansas, late Commander-in-chief of the G. A. R., has refused it on account of unshake-off-able private business, and it is hard to get a good man who will at once suit the pension-paying public and the pension-drawing veterans..... Last Thursday, at the Presbyterian church at Richfield Springs, N. Y., Emmons, eldest son of James Gillespie Blaine, and Anita Mc Cormick, one of the three children of Cyrus Mc Cormick of reaper-and-mower fame, were married in presence of a large assembly of distinguished guests from all sections of the country. She is about 23, of medium hight, slender, fair. with dark hair and $3,000,000 in her own right. He is about 32, with hair already silvered and much like what his father used to be at the same age. He started in law, but is now railroading.....The Wyoming Constitutional Convention has fixed a limit for the tax levy for State purposes at four mills on the dollar, except in cases of schools, public charities and payment on State debts. County taxes are limited to 12 mills, and cities and towns to eight mills. Public moneys must be deposited in national banks, and the interest goes to the State..... The California speculation in earthly Edens has almost entirely collapsed. High-priced building lots in multitudinous paper towns are fast relapsing into their normal condition of grass or wheat fields and the real estate boom has "bust."..... Like the Republicans of Virginia, the Republicans of Mississippi have pitched upon a Confederate Brigadier as their candidate for Governor. But while Mahone has a fighting chance, Chalmers hasn't a ghost of one; though there's little doubt that his mere candidacy will send many "niggers" to ghost-land, in the original home of the "shot-gun policy."..... The cruiser Baltimore, designed and built under the last Administration and launched and fitted out under the present, is declared to be the fastest war-ship afloat in the world. In her trial trip she made about 25 miles an hour.....August Boorfried, a Minnesota stone-mason, says he has discovered a process by which granite, marble or even cobblestones may be liquified and run into molds..... The New York Committee in charge of the matter have selected, as the site for the World's Fair, Morningside Park, comprising about 425 acres, Bloomingdale Asylum grounds, comprising about 84 acres, and as much of the upper part of Central Park as may be needed. These are all close together and nearly in the center of the city. A small minority of the committee and a considerable minority of the people are strongly opposed to the "ruination" of Central Park by appropriating any part of it for the purpose. The only thing in which the great New York dailies agree is in bitterly blackguarding each other; hence while some are blithely supporting the committee's recommendations, others are fiercly combatting them as far as the Park is concerned. The conflict of opinion has a dilatory effect on the Finance Committee and a let-her-rip effect on many of the public who, in disgust, are losing all interest in the whole question. Great things are promised all the time, but promises will never secure the show. Chicago is working hard and skillfully. She is thoroughly canvassing the entire country and especially the West. She has no difficulty about a site, as the prairie farms within her illimitable borders would readily accommodate a dozen such shows. She has raised about $5,000,000 in promises and engages to raise double that amount in cash. If she doesn't get the show, she'll have deserved it. St. Louis, stimulated by the Windy City's breezy energy, has secured a pledged guarantee fund of over $6,000,000, and the results of her efforts "greatly exceed the most sanguine expectations of the managers." Washington is quietly "laying pipes" and confidently waiting for the assembling of Congress. She sees a big chance for herself in the keen rivalry between her opponents..... Quebec, second in importance only to Montreal among Canadian cities, with its 65,000 population, is divided into the Upper and Lower Town. The former embraces the Citadel, nearly all the fine residences and numerous religious institutions; and the latter—a long, narrow strip between the River St Lawrence and the 330-feet-high bluffs—contains most of the large business houses, warehouses and workshops abutting on the wharves. Champlain Street is a narrow lane running directly under the highest part of Citadel Cliff at the end of Cape Diamond. A week ago last Thursday, about 8 P. M., after three days of constant rain succeeding a long dry spell, a vast slice of the bluff, about 300 feet long and 80 feet broad, broke off, and came crashing down on seven houses inhabited by about 30 families, chiefly working people. Some of the rocks weighed upwards of 20 tons, and the fallen débris, consisting of moss, stones and soil, formed a solid mass 300 feet long, from 35 to 80 feet broad and 15 to 25 feet high. During incredible labor for nearly a week 52 dead or dying people were taken out of the ruins and many more were more or less seriously injured. Another widening and deepening fissure in the bluff has induced the authorities to recommend the abandonment of 900 houses—chiefly along the precipice in the Upper Town—at least for the present, as a precautionary measure. Two similar disasters, in '41 and '53, were less fatal, but gave warning which, of course. has been neglected..... General D. H. (Daniel Harvey) Hill, the celebrated Confederate leader, died at Charlotte, N. C., last Tuesday, at the age of 68. Born in North Carolina in 1821: graduated from the United States Military Academy at West Point in 1842; served bravely in nearly every important battle of the Mexican war; resigned his commission in 1849 and became Professor of Mathematics in Washington College, Lexington, Va., and after five years there took a similar position in Davidson College, N. C., and then became superintendent of the North Carolina Military Institute at Charlotte. Entered the Civil War as colonel and after much skillful and brave fighting came out as Lieutenant-General. For years after the war he edited the monthly magazine "The Land We Love"; was elected President of the University of Arkansas in 1877, and later became President of the Military and Agricultural College of Georgia..... Cornell University has just opened the new year with 1,400 students, in all. The increase is proportionately greatest among the lady students.....The Hebrew New Year—the 5,650 Rosh Hashannah—was celebrated all the world over last Thursday by the Israelites with general rejoicing. This is the oldest surviving celebration, founded by Moses, in commemoration of the delivery of the law on Mount Sinai.....

Altogether Tangible.

So long as one is not asked to concentrate faith upon illusion there ought to be no backwardness in getting into a receptive mood at least. Note the encouragement in the following:

BARNWELL, S. C.

"The Compound Oxygen Treatment did more to effect a cure than all other so-called remedies combined."

G. DUNCAN BALLINGER.

SUMTER, S. C., March 13, 1888.

"My wife had been suffering from severe neuralgia for weeks, and was relieved from the beginning by Compound Oxygen."

REV. J. S. BEASLEY.

MIFFLINTOWN, PA., March 29, 1888.

"I have now used the Compound Oxygen three weeks. I am very much improved in every way, and believe that by the blessing of God your valuable remedy will restore me fully." REV. E. E. BERRY.

LITTLE ROCK, ARK., March 30, 1888.

"I am happy to inform you that I am of the opinion that your Compound Oxygen saved my life." MR. J. P. BAILEY.

We publish a brochure regarding the effect of Compound Oxygen on invalids suffering from consumption, asthma, bronchitis, dyspepsia, catarrh, hay fever, headache, debility, rheumatism, neuralgia; all chronic and nervous disorders. It will be sent free of charge to any one addressing DRS. STARKEY & PALEN, 1529 Arch St., Philadelphia, Pa.; 120 Sutter Street, San Francisco, Cal.—*Adv.*

FOREIGN NEWS.

SATURDAY, September 28, 1889.

WILLIAM WILKIE COLLINS, the celebrated novelist, died at his home in London, last Monday, aged 65.....Eliza Cook, the English song-writer and poetess, author, among other once popular songs, of "I'm Afloat," the "Old Arm Chair" "The Old Farm Gate" and "I Miss Thee My Mother," died last Wednesday, at Wimbledon, near London, at the age of 72.....In the Republic of Guatemala, in Central America, with an area of 40,777 square miles and a population of about 1,500,000, the value per acre of the agricultural land has more than doubled within the past two years, and the area under tillage has increased in about the same ratio. The value of the coffee crop next year is expected to reach $11, 500,000: maize, wheat and other cereals as well as cotton, sugar-cane and tobacco are also extensively produced. Only quite recently have the crude agricultural implements of the first colonists been superseded by modern machinery.....

AGRICULTURAL NEWS.

SATURDAY, September 28, 1889.

THE third annual Corn Palace Carnival opened at Sioux City, Iowa, on Monday with a large attendance.....The State Inspector of New Jersey on Monday killed 32 head of cattle at Millstone, Somerset County, that were afflicted with pleuro-pneumonia. The disease has also broken out among the cattle in Chester, Montgomery and Berks Counties, Pennsylvania. Hog cholera is raging in Kent County, Maryland, and more than 200 hogs have already been lost. An outbreak is also reported from Queen Anne County..... The State Farmers' Alliance of Florida has been in session at Jacksonville, Florida, during the past week. The principal objects of the meeting are to make Jacksonville a wholesale market for cotton, the building of a cotton ware-house, and the starting of fruit and vegetable canning factories. A company is also organized to build a cotton factory. Florida raises annually 20,000 bales of Sea Island cotton, and 80,000 bales of upland, which is now marketed principally in Savanah and Brunswick, Ga..... The steamer Denmark recently brought over 162 Norman horses.....The Mexican Government has issued a decree increasing the duty on goats.....One of the largest fig orchards in the United States is about to be set out in Pomona Valley, California. It will consist of 11,000 white Adriatic fig trees and 5,000 Smyrna fig trees, planted 80 to the acre.....The New York Poultry and Pigeon Association has been organized as a stock company, and will hold an exhibition at the American Institute, this city, February 19 to 25, 1890. Arrangements will be perfected for a successful exhibition, and the holding of it in this city will go far to insure this. T. F. Rackham, secretary, East Orange. N. J.... Much of the wheat throughout Western Europe is not fit for milling purposes without an admixture of foreign wheat..... The new crop of raisins from California has reached this market. The Lion brand of loose Muscatels were the first to arrive.. .....The unfavorable weather has had a disastrous effect upon the sweet corn growers and canners in Maine, the crop in some localities being nearly a failure. Most of the canning factories are already closed, and the pack is very light. Prices are likely to be high, and remnants of last year's crop are in demand.....A Jersey farmer living near Moorestown was recently convicted of selling milk containing less than 12 per cent. of solids, and sentenced to pay a fine of $57. This he refused to pay, and he was imprisoned for 20 days. He says he never watered his milk, but took it to the creamery just as it came from the cows, and that if it contained less than the required amount of solids, the law was wrong. There are a number of farmers who will stand by him, and he threatens to make it warm for some one when he is released..... Severe frosts occurred early in the week throughout Northern New England and New York, and in several of the Western States. Owing to the backward season much damage resulted to late corn and buckwheat, and vegetables and grapes. Other crops were mostly out of reach of harm.....The farmers in Mississippi are as determined as ever not to use jute bagging. In some counties the Alliance threatens to expel any member using jute bagging, and has passed resolutions to that effect. The supply of cotton bagging is short in some sections, and it will be late in the season before a full supply can be procured, but the farmers are determined to withhold the crop until cotton bagging can be obtained..... In the United States Circuit Court at St. Paul on Monday, Judge Nelson delivered an exhaustive opinion holding the Minnesota Meat Inspection Law unconstitutional and void. He holds that it is in violation of the commercial clause of the constitution which provides that Congress shall have control of commerce between the States, and also of the clause which provides that the citizens of each State shall be entitled to all the privileges and immunities of the citizens of the several States. This decision practically settles the validity of the inspection laws, as there is no court, excepting the United States Supreme Court, that has authority to reverse this decision, and it becomes the law until it is reversed. In case of an appeal, the case could not be heard in the Supreme Court in from three to five years. Those desirous of fighting Chicago dressed beef will have to adopt some different tactics in the future..... This has been a very unfortunate season for nearly all of the agricultural exhibitions commonly called fairs. The Clerk of the Weather seems to have had a grudge against some of them, and deluged them with rain to such an extent that in some cases they came very near being failures. The entries in nearly all cases were large, and with good weather success would have been assured. The New Era Exposition at St. Joseph, Missouri, was very unfortunate in having the main building destroyed by fire in the midst of the exhibition.....The steamship England of the National Line recently took across 1,250 steers, averaging 1,400 pounds each, being the largest single shipment of live cattle ever carried out of any American port. The cargo also included 4,000 bales of hay and 4,000 bags of corn for feeding the cattle en route. This line stopped carrying passengers some time since, and engaged their vessels exclusively in the cattle carrying trade.....Complaints are made that farmers in Maryland are shipping their cholera-infected hogs to Baltimore regardless of consequences.....

For preparing the ground for fall seeding, the Clark's Cutaway Harrow will more than pay for itself in one season. No use for the plow on stubble land. Take it and try it and you will buy it. Send for new circular.

Higganum M'f'g Corp., Sole Man'f'rs, HIGGANUM, CONN.

Crops & Markets.

SATURDAY, September, 28, 1889.

DESPITE the floods and frosts of spring and summer, the crops of the country at large will average good. While particular crops in certain sections are partial or total failures, in others they are above the average, so that could the supply be equitably distributed, there would be an abundant supply, with a generous surplus for export. Excessive rains in many parts of the country have prevented a free marketing of produce, but prices are generally good, and the season promises to prove a fairly prosperous one.

CORN has been injured by frost to some extent, but the crop will average better than it promised two months ago. There has been little change in other grains.

HOPS are dull at present as buyers are waiting for lower prices before buying heavily. Small lots of new are arriving but sell slowly. There is little probability of prices being lower.

BUTTER shows a wide range in prices. We don't believe there was such a difference in the quality of the milk from which these different grades were made as is indicated by the finished product. Isn't it a shame to use milk that, if properly manipulated, would make 25-cent butter in such a way that the product is worth only 10 cents? The best grades of butter are not in sufficient quantity to supply the demand, consequently prices are advancing while the lower grades show no improvement and, in some cases must be sold at lower prices.

HAY is coming forward in large quantities, and the prices of all grades have declined considerably. The future price is somewhat problematical, but from the amount of hay secured in poor condition, we think it safe to say that prime hay will bring good prices, probably higher than it is now quoted.

FRUITS of all kinds are in moderate supply for best grades. Fancy red apples sell as high as $4.50 per barrel. They must be carefully assorted and nicely packed. Fancy pears sell high. Peaches are getting scarce, and choice are in demand at good prices. Cranberries are active and higher, Choice grapes sell readily at good prices, but there are plenty of poor grades that go very slowly. Dried and evaporated fruits of all kinds are higher, and firm.

VEGETABLES of all kinds are in fair supply. Potatoes maintain their price well, and the supply is not large. The rot seems to have done its worst, and there seems little prospect of further material loss from this cause. While potatoes in some of the Western States are reported a very heavy crop, and worth only from 15 to 25 cents per bushel, with little sale, they are worth here from $1.50 to $2.50 per barrel. Sweets are but a trifle higher. Onions meet with slow sale, and reds are lower. Cabbages are somewhat higher. Tomatoes are of poor quality, but the supply is so small that prices are well maintained. Beets, turnips, carrots, parsnips, corn, egg plant, peppers, radishes, salsify and squash are plentiful and help to make up any deficiences that may exist. Choice celery and cauliflower are not very plenty, and are wanted.

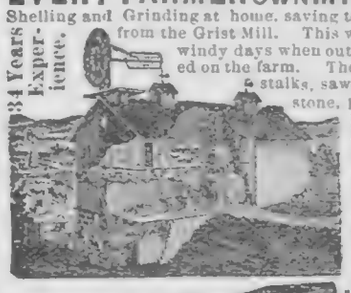
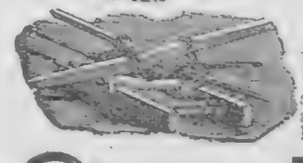
EVERY FARMER HIS OWN MILLER DO YOUR OWN
Shelling and Grinding at home, saving tolls and teaming to and from the Grist Mill. This work can be done rainy, windy days when out-door work is suspended on the farm. The same Mill will cut corn stalks, saw wood, run churn, grindstone, pump water, etc. We make the HALLADAY Geared Wind Mill in 11 sizes, 1½ to 40 horse power, and GUARANTEE they have no equal for Power, Durability and Storm Defying qualities.
34 Years' Experience.



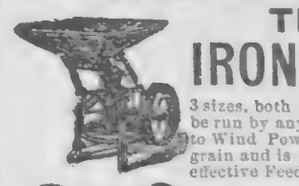
IXL 2-HOLE Corn Sheller
Adapted to run by hand, horse, steam or wind power. Not cheaply made but strong, durable and effective in its working yet light running. It is constructed similar to the large Power Shellers and is the best 2 Hole Sheller on the market.

HORSE POWERS
and JACKS, both single and double Geared, made heavy and strong.



THE IXL STALK CUTTER
made in 5 Sizes, with Safety Fly-Wheel, Safety Lever, and all late improvements.

THE IXL IRON FEED MILL
3 sizes, both Belt and Geared Mills. Can be run by any power and especially adapted to Wind Power. Will grind any kind of grain and is the lightest running and most effective Feed Grinder made.



SAW TABLES
Both Swinging and Sliding Tables. We make a Saw Table especially adapted to sawing long poles. Special care is taken to make these machines strong and durable.

IXL TANK HEATER for warming water in Stock Tanks. Made of the best quality of iron cast in one piece, no sheet iron to rust or solder to melt and cause leak. Will burn any kind of fuel. It is very effective and takes less care to operate than any other Heater made.
We also make the HALLADAY PUMPING WIND MILLS. 18 sizes, 8 to 60 ft; diameter and 1 man to 40 horse power. The U. S. SOLID WHEEL WIND MILL, 7 sizes, Iron and Brass Pumps in great variety. Tanks, all kinds and sizes, and the Standard Hay Tools, consisting of Anti-Friction, Swivel, Reversible and Rod Hay Carriers, Harpoon and Grapple Horse Hay Forks, Pulleys, Floor Hooks, etc. All goods fully guaranteed. Send for Catalogue and Prices. Reliable Agents wanted in all unassigned Territory.

Various.

RURAL RUMINATIONS.

ONE of the RURAL'S correspondents spoke recently of doing considerable figuring while at work. I have been ruminating, while at work during the summer, on various matters which have been served up to RURAL readers from week to week. There is much in the RURAL from week to week to provoke discussion, and much that is worthy of careful thought, but I shall notice only those things which have suggested themselves most strongly to my mind. Some of them may be slightly out of season, but that is the fault of the season, and not mine.

THE FARM NOT ALL THAT FANCY PAINTS IT.—The truth of the old adage is exemplified in the letter of your English correspondent on page 365. To him, "distance lends enchantment to the view." Thousands of farmers may admire the flight of rhetoric, but the actual facts are not all his fancy painted them, and facts are stubborn things. Instead of the substantial brick or neatly painted frame house, in too many cases is to be seen the weather-beaten "wood-colored" one with its smoke-begrimed chimney, and desolate air. The open windows are too often open in sections of seven by nine or eight by 10 inches in size, except when closed by some of the family's discarded garments, hats, or dilapidated bedding. Some seasons past, in many of our cooling streams, the cows would need mighty short legs to find water knee-deep, while during the present one, if they ventured near many of the gentle rills, they would in all probability have been drowned. The yellow wheat if it has smiled at all, has greeted a leaden sky. The corn in many fields must wave its banners unseen, for they are hidden by the weeds. As for owning the farm and having no rent to pay, thousands of farmers are paying more in taxes and interest each year than their farms would rent for. There are thousands of farmers in this country who would be supremely happy could they realize as a fact, the conditions painted in such attractive colors by this correspondent's fancy. I am impelled to notice this point at length, for the reason that so many fail to see the advantages surrounding them in their present situation, and dwell upon the disadvantages, until it seems to their distorted imaginations that any other location is better than their present one. This accounts in large part for the constant migration among the agriculturists of this country. This is to be deprecated. There undoubtedly are cases where a change is beneficial, but I venture the assertion that where one betters his condition, a dozen fail to do so, if indeed they do not do worse.

DODGING THE QUESTION.—This is what some of the correspondents do when treating of questions in the "symposiums," and other discussions. On page 401 a subscriber asks if a bull from stock which has been soiled for several years will be a good one for his purpose under different conditions. Only one of the breeders trying to answer his question, gives any light on the desired point. They all wander off into a rambling discussion of the subject in general, instead of coming out boldly and telling just what they really know of the subject, which is —nothing. In the discussion between Prof. Porter on the one hand, and several college gentlemen on the other, as to the utility of agricultural colleges, each side showed a disposition to ignore the existence of those colleges whose history would not bear out its own arguments. Facts are what we want, and I have much more confidence in the teaching of a writer who occasionally says: "I don't know," than I have in those of one who is forever and eternally dodging the question and telling us what he thinks, what should be the result, etc., etc.

A SHOCKING SUGGESTION.—I always have had a great regard for the writings of Prof. A. J. Cook, but his suggestion, on page 461, to cut the shade trees from the pastures gave my confidence in him a severe shock. I should consider such an action a cruelty to animals. I don't believe flies will attack animals any more in the shade of trees than they will in the hot sun, and I know from many years' observation that cattle prefer the former. The course proposed by the Prof. as the best, *i. e.* to keep the stock in the barn during hot weather, is a good one and will help to redeem Prof. C. from the charge of cruelty. I have known of instances where sheep and cattle went long distances from the pasture to a cool barn basement, as soon as the heat grew oppressive, and remained there until evening, when they would return to the pasture and feed comfortably until another morning. Animals show by their actions when they are comfortable and contented, and it is not only merciful to render them so as far as possible, but it is a matter of dollars and cents. I would take the testimony of a cow's actions in regard to her comfort, rather than all the say-sos of all the professors you could crowd into a 10-acre lot. R. U. MINANT.

Literary.

MAGAZINE REVIEWS.

LEND A HAND contains a considerable information about the Industrial Aid Society of Boston, which endeavors to supply employers with suitable help free of expense. The society has been very successful in supplying help adapted to situations offered. "A State School of Citizenship" is offered as a remedy for the Parochial School difficulty. A list of books "which boys and girls will read, and which it is well they should read," is given. "Something New" tells of the Temperance Education Society which was incorporated in Chicago last June. It has adopted the methods employed by shrewd business men in advertising their business by means of cards in the street-cars of the city. These are carefully prepared, the statements being taken from official returns that cannot be challenged, and are "non-partisan, non-political and non-sectarian." The object is to get facts before the public that will not be brought to their notice in any other way. They are facts that are designed to set people to thinking. Here are a few samples:

"One million six hundred and seventy-five thousand barrels of beer consumed in Chicago in 1888."

"At five cents a glass, 320 glasses to each barrel, $26,800,000, Chicago's beer bill."

"$26,800,000

IS	MIGHT BE
SPENT FOR	SPENT FOR
BEER,	11,166
1,675,000	HOMES,
BARRELS,	AT $2,400 EACH,

BY WORKINGMEN."

These cards are printed in an attractive manner, and are changed monthly. This is certainly a commendable movement, and it is hoped that the idea will spread. The secretary of the society will be glad to correspond with those in other cities who may be interested in similar work, and he may be addressed at 158 South Clark Street, Chicago. There are suggestions as to "Methods of Promoting Good Citizenship, reports of Ten Times One Clubs, charitable organizations, etc." J. Stilman Smith & Co., Boston.

THE PANSY tells about a poor boy, Jamie by name, who was small, and not very strong, and found it difficult to find work to help his poor mother. He did pretty well picking and selling berries during the summer. One day, near the close of the berry season, he had seen a notice: "Boy Wanted" in a shop window, with directions to call between the hours of eight and 10 next day. He had agreed to pick some berries for one of his customers that morning, and he wanted to apply for the place. He talked it over with his mother the evening before. Of course, he must get the berries, because he had promised. He would have to hurry and would not have time to go home to change his clothes after delivering his berries, and he knew he would be "too late to get the place." Several other boys were there before him, and each upon being shown into a room alone, behaved himself in such an unseemly manner, and took such unwarrantable liberties with the furniture, etc., that he was soon dismissed. Then our little hero appeared in his torn and dirty clothes, and upon being questioned as to the reason of his being so late told the story with which we are familiar. He was shown into the same room, and busied himself with arranging what the other boys had disarranged. "I've got the place, mother!" he shouted half an hour later. A mirror in the room had been so arranged that it revealed to the gentleman in another room every action of the boys who supposed themselves unobserved. He very rightly concluded that a boy who couldn't be trusted alone in a room for five minutes, wouldn't suit him. We know our little hero could be trusted. There are many more stories which will interest the little ones, and whose tendency is beneficial. D. Lothrop Company, Boston.

THE WRITER for September contains an article on "Letter Writing to Cultivate Style," which is very valuable. The idea is that in writing letters to friends one will express his thoughts naturally and simply, and thus unconsciously acquire an easy, unconventional style that is the ideal of good writing. "Newspaper Makers and Newspaper Grumblers" contains a great deal of truth that will apply to all classes of periodicals. Newspapers are made for the million, and when the grumbler finds one that just fills the bill it will need to be made to order, or, perhaps, he will make one himself. Some plain directions are given for "Home-Made Book Shelves." "The People and the Post-Office" by the ex-postmaster of a flourishing Western city, gives much valuable advice about different methods of remitting money, mailing packages, etc. There are many other notes, hints, etc., useful to literary workers. The Writer, Boston, Mass.

BOOK REVIEWS.

A NAMELESS WRESTLER, by Josephine W. Bates, is a novel with a strong, and decidedly original plot. It affords a genuine surprise to find a work of fiction so different from the common run of paper-covered literature. The characters sometimes give one the impression of being over-drawn, but this only brings them out in a stronger light. The scene is laid in Portland, Oregon, in its earliest history, and the adjacent mines of the Rockies; and the grand scenery, wild life and peculiar people of that wonderful region are described by a master hand. Paper covers 50 cents.

JULIAN KARSLAKE'S SECRET, by Mrs. John Hodder Needell. The hero is a young English curate of considerable fortune and unexceptional personal worth who wooed the daughter of an impecunious literary recluse, and was successful in his suit only because she was constrained to sacrifice herself for the good of the family, whose dire necessities the wealthy suitor insisted on supplying. His "secret," jealously guarded from even his wife, was a vow made to his dying mother to shield his younger brother who became a reckless renegade. His own happiness was nearly wrecked by his conscientious adherence to his pledge, but everything was finally explained, and all were happy. The author has succeeded in exemplifying moral heroism to a degree hardly to be expected in real life. Paper covers; 25 cents. J. B. Lippincott Company, Philadelphia.

ALREADY the publishers are preparing their Christmas books. Lee & Shepard have put forth a beautifully illustrated short poem by Kate Tannatt Woods, "The Wooing of Grandmother Grey." It is printed on very heavy supercalendered paper, and bound in bronze cloth with gilt lettering. A pretty holiday, or any day, souvenir for the dear grandmother. Eight by 10½ inches, price $2.00.

We are in receipt of the second of the Blue and the Gray series, by Oliver Optic—"Within the Enemy's Lines," the first of which was: "Taken by the Enemy." "Within the Enemy's Lines" deals chiefly with a young "middy's" fortunes on board a privateer during the Civil War, and, of course, will please the boys. Size 5½ by eight inches, about 300 pages; price $1.50. Lee & Shepard, Boston.

CATALOGUES, ETC., RECEIVED.

THE FARM AND THE DAIRY.—By Prof. J. P. Sheldon, published by George Bell & Sons, York Street, Covent Garden, London, England. Our readers know Prof. Sheldon. He is a careful, observing man, who does not speculate or theorize, but writes from practical experience. We may therefore safely expect to find in this little book a concise and interesting account of the dairy matters found useful on an English dairy farm. It is quite likely that the expert dairyman who has fully mastered the details of his business, may not be able to find anything very new in the book; still for the young dairymen and particularly for the beginners, this volume will prove very valuable. The whole subject, from the selection of the farm to the sale of the product, is clearly described.

MISSISSIPPI STOCK FEEDING.—Bulletin No. 10 from the Mississippi Station, "How to feed stock in the cheapest manner" is the problem discussed in this pamphlet. The cheapest method for Mississippi might not be the cheapest for Maine; still there are a good many farmers in both States who will indorse the first sentence in this pamphlet. "The silo system has practically solved this problem." They use the common wooden silo in Mississippi and in addition they use a very primitive affair which is described as follows:

"It was made by simply piling up the silage in as round and compact a heap as possible and covering with dirt about 12 inches thick, dug from all around the base of the pile, the excavation acting as a drain. This cheap silo was built of "chicken corn." It was cut October 10, just as the seeds were turning black or brown. The stalks were put in whole and piled straight. The heap was then dressed off and smoothed up by setting the stalks on end and around it. About eight tons were put into the heap and the whole covered with earth. Then a thin layer of stalks was spread over the heap to shed water. It was opened January 19th. As might be expected, for three or four inches down, it was discolored, but all below that was green and sweet. Cattle ate it readily and there was no trouble in getting them to eat that which was discolored. When the heap was opened, 10 or 12 head of cattle that had never seen silage before happened to be near by and ate it greedily. The chicken corn was cut with corn knives and carried to the heap. Putting on the covering of dirt was very little expense, as it could be thrown rapidly with a spade from the surrounding ground on to the pile. Seventy-five cents per ton covered all expenses of cutting, hauling, etc. Care was taken to have no openings into the heap and no cavities in the pile, as the air should not come in contact with the silage. As the pile settled, the dirt adjusted itself."

The other silos were made much like those already described in the RURAL. The experiment brings out little that is new regarding the making or feeding of the silage. Corn gives the best satisfaction, though sorghum gives the largest yield. Drilled corn yielded at the rate of about 12 tons per acre; while broadcasted corn yielded about 10½ tons. Chicken corn (Sorghum vulgare) is considered a pest by many Southern farmers. It grows luxuriantly and is hard to kill out. In fact it has been regarded as a weed rather than a valuable plant. Seeds of the "chicken corn" were used at the Mississippi Station in a feeding test against ordinary corn. The test proved nothing, the only figures taken being the weights of working animals before and after a term of feeding. The animals fed on the "chicken corn" lost a few pounds more than those raised on common corn. Analyses of the "chicken corn" show that it contains more protein and less fat and carbohydrates than common corn. Its surplus of protein should make it a superior grain for working animals. It may be that this neglected plant may prove more valuable than other plants now cultivated.

SILOS AND ENSILAGE—SILAGE *vs.* FIELD BEETS AS FOOD FOR COWS.—Bulletin No. 10 from the Ohio Station. There is hardly enough in this discussion of the ensilage question to warrant its publication. The agricultural papers have brought the matter to a point where a history of the process and quotations from the papers seem behind the age. It is safe to say that every farmer who will read this bulletin has already studied most of the facts in other publications. We are glad to see that horses were fed on silage. For two months the horses were given one feed of 20 pounds per day, in the place of the usual amount of hay. The result was highly satisfactory in every way.

The station has done an excellent thing in seeking to compare silage with mangels. The work seems to have been very carefully done. The following extract from the bulletin will be read with interest by the farmers who have grown roots for years and are now urged to try silage.

We were able to produce 14 to 19 tons of ensilage corn per acre upon rich bottom land. On the same land we expect to raise about as many tons of roots. The corn probably yields a somewhat larger quantity of dry matter per acre than the beets, unless some way can be devised for utilizing the tops also of the root crop. There is some loss of the dry matter of the corn in the silo; we have not yet succeeded in inducing our stock to consume all silage given them, and our one experiment indicates that the dry matter of corn silage is somewhat less effective as a food for milk production than that of roots. So far, therefore, as we are able to judge at present, we can produce about the same quantity of potential cattle food from an acre of land in the form of corn silage as in that of roots. We are not yet sure, however, that the cost of production will be the same. Roots, as well as ensilage corn, are expensive crops to handle. Both require land that is either naturally very rich, or that has been artificially enriched, in order to produce profitable crops. Our experience leads us to believe that roots will require relatively heavier manuring than corn, in order to maintain the yield. In other words, the root crop is an extremely exhaustive one on the soil. In respect to the relative labor cost of the two crops, we are yet in doubt. By judicious management we believe that the labor cost of producing the root crop may be brought down nearly or quite to the cost of producing a corn crop for ensilage by the time all the necessary expenses of cultivation, harvesting and housing are counted, but we are not yet prepared to offer any demonstrated facts in support of our theory.

The results of this experiment point to two conclusions, which we believe will be confirmed by further experiment. These are:

1. The dry matter of corn silage and of roots is at least equal in value to the dry matter of the better grades of stock feed in ordinary use when fed in properly adjusted rations.

2. Corn silage is slightly superior to roots as a flesh or fat producer, and roots are slightly better than corn silage for milk production."

EXPERIMENTS WITH SMALL FRUITS. EARLY AND LATE PICKING OF APPLES.—Bulletin No. 11 from the Ohio Station. The station reports on small fruits will be interesting to fruit-growers generally. They are quite complete. Quite an interesting experiment in picking apples at different dates is recorded. Five varieties of apples were used. One hundred apples of each variety were picked September 26, and October 6, 13 and 20. Estimates were made as to the number of sound apples left 58, 175 and also 256 days from picking. The conclusion reached is as follows:

"Early picking of apples improves their keeping qualities, but no difference is manifest for nearly six months after picking. If kept for a longer period than six months the early-picked apples show a decided gain over those picked late. The greater part of the loss in weight, caused by drying, occurs within six months after picking. The early picked apples lose slightly more in weight than those that are picked late."

SPRAYINGS WITH THE ARSENITES.—This is the title of Bulletin, No. 53 of the Michigan Station. This is the substance of a paper read by Prof. A. J. Cook, at the late meeting of the Society for the promotion of Agricultural Science. Prof. C. finds that the arsenites can be used to protect against the plum curculio, but the difficulty is to keep the mixture on the tree. In case of frequent rains, the jarring method will be cheaper and more effective. He also thinks the time will come when we must plant plum trees in our apple orchards to protect the apples from the curculio. In such an arrangement, the apples will be sprayed to kill the coddling moth, while the plums will be sprayed or jarred as the season demands. In very rainy seasons, the jarring will be used. Prof. C. also refers to the danger incurred in spraying too early before the blossoms fall. Poisons will kill bees about as readily as they will kill curculio or coddling larvæ. Prof. C. would even suggest laws to prevent the killing of bees by spraying poisons before the blossoms fall. As regards the injurious action of various poisons on foliage, Prof. C. concludes that London-purple is more injurious than Paris-green—a fact which the R. N.-Y. discovered eight years ago—while white arsenic is more harmful than either. Peach foliage he finds most susceptible to injury and cherry the least. It also appears that London-purple and white arsenic, used just before a rain, are more harmful than when used during a drought. On the peach, Paris-green only should be used and never stronger than one pound to 200 gallons of water. The injury done to the foliage is not usually shown until the second day and is frequently delayed until the fifth or even the 10th day. Some experiments were made to determine the danger to stock in spraying the trees with the arsenites. A large tree with thick foliage was well sprayed. As soon as the dripping stopped, the grass under the tree was cut close to the ground, and carefully analyzed. The analysis revealed 2.2 grains of arsenic. A poisonous dose of this substance is one grain for a dog, two for a man, 10 for a cow and 20 for a horse. Little danger there. Another tree was sprayed and the grass under it cut and fed to a horse without any injurious effect.

APPLYING FERTILIZERS.—In the Georgia Crop Report for September the "School of Chemical Fertilizers" by Prof. George Ville is continued. This is a sample:

"Q. After plowing the soil to required depth, what is the best way of using chemical fertilizers?

A. Harrow until a smooth surface is made; spread the fertilizer broad-cast and harrow until well mixed with the loose soil. One of the peculiar advantages the chemical fertilizer has over the barnyard manure, is the use of it broadcast in early spring over cereals that have gone through a hard winter. Eighty-eight to 176 pounds of sulphate of ammonia, or 132 to 176 pounds of nitrate of soda, mixed with 220 pounds of plaster, spread broad-cast in March, will show a great change in wheat in two or three days—used in this way chemical fertilizers act like magic. But some precautions must be observed. Later than the middle of March might be dangerous. Used in April or May, it makes extraordinary growth of straw, but the grain is malformed and inferior in quality. When the fall is wet and grain is sowed late from want of time, fertilizers can be used broadcast after all the grain is well up. Barnyard manure cannot be used in this way."

THE DISPOSAL OF THE DEAD.—This is the title of a paper read by Dr. John M. Peacocke of Brooklyn, before the Kings County Medical Society. It is now issued in pamphlet form. The R. N.-Y. has never before read so clear and intelligent a discussion of this important subject. From the earliest times the proper disposal of the dead has been regarded as a very important matter. Originally, the dead were laid in woods or in fact wherever they could be exposed to the elements or become a prey to wild beasts. As men began to multiply on the face of the earth these rude and inhuman forms gave place to interment, embalmment, entombment and incineration; and until within a recent date no new methods of caring for the dead have been proposed. In rural districts where land is plentiful, and it is not necessary to erect dwelling places or sink wells close to graveyards, the ordinary burial or interment has always been regarded as the best method. In the large cities, however, the time has come when such burials are no longer safe or desirable. Dr. Peacocke's remarks apply more particularly to the dead of New York and Brooklyn; but they may be applied with equal truth to the dead of all large towns and cities. When we consider that only 96 years ago the population of New York city was only 35,000 souls and that paupers were actually buried in what is now the City Hall Park, it is easy to realize that 50 years hence the present city cemeteries will be found in the very center of a teeming population, which will be forced, in time, to build their dwellings upon the graves which can only be termed "beds of pestilence."

But what is to take the place of interment? The time is evidently coming when it will be impossible to bury the dead within 15 miles of the center of population in New York or Brooklyn. What then? Scientific men offer two methods: incineration or "cremation," and desiccation or perfect drying of the remains. Before the Christian era, cremation was in quite general use. As Christianity spread, cremation became gradually obsolete and the dead were "consigned to the slow and loathsome process of putrefaction in the grave or tomb." Cremation was not revived until 1868, when the subject was introduced at the International Medical Congress at Florence as a sanitary measure of great importance. Europe has now 24 crematories, while there are 10 in this country. The chief impediment that obstructs the advance of cremation is the sentimental objection. There is something horrible to the minds of many in the thought that the remains of our dear ones are to be burned. On this point Dr. Peacocke quotes Prof. Groes as follows:

"If people could see the human body after the process of decomposition sets in, they would not want to be buried, they would be in favor of cremation, and would look upon burning the human body as a beautiful act in comparison with burying it. There is something eminently repulsive to me about the idea of lying a few feet under the ground for a century or perhaps two centuries, going through the process of decomposition."

As to the best method of disposing of the dead, we are told that in Peru animals that drop by the wayside will be found at the end of months entire, not corrupted, but dried. The writer has noticed something of this sort on the plains of Colorado and Wyoming. The dry, pure air of these regions drives the greater part of the moisture of the body away while the form is retained, in a dried and shrunken form it is true, but still retained. Now "desiccation" is but the providing, by artificial means, of the conditions that go to preserve bodies in these dry countries. As it seems very evident that before many years "desiccation" will be advocated as a means of relieving our city church-yards, the R. N.-Y. gives Dr. Peacocke's account of the process as now conducted.

"The corpse is placed in a chamber constructed with pipes so arranged as to bring fresh, dry air into them and conduct it through the casket, and by forced draughts through a central furnace, where all the gases and fluids taken from the body are consumed. The air-current is sufficiently rapid to make an entire change in the space every two seconds. When desiccation begins, the chamber containing the body is hermetically sealed, except as respects the inlet and outlet passages for air, which are closed when the process is completed. The desiccating method has for its basis the fact that in all animal tissue water is present in greater or less proportion, forming about two-thirds of the weight of the whole body. A man weighing 165 pounds, if completely dried, would therefore lose about 110 pounds from the evaporation of water. An opportunity was lately afforded me of inspecting and examining the body of a man undergoing the process of desiccation. The remains lay in a glass-covered metallic case, having been placed therein about nine months ago, and at that time weighed 160 or 170 pounds. Judging by the dried-up appearance of the body, I presume that to-day it does not weigh over 60 pounds. The muscles of the trunk, and especially of the extremities, are shrunken and hard. The integument is dry and feels leathery to the touch. The countenance looks natural. There is no discoloration of the cuticle and no evidence of any decomposition. A current of ordinary air is admitted to the casket at one end, it freely circulates around the body, and escapes through a tube, placed at the other end, into a chimny or furnace through which all the volatile products pass before mingling with the atmosphere."

MANLY PURITY AND BEAUTY

CUTICURA REMEDIES CURE SKIN AND BLOOD DISEASES FROM PIMPLES TO SCROFULA.

NO PEN CAN DO JUSTICE TO THE ESTEEM IN which the CUTICURA REMEDIES are held by the thousands upon thousands whose lives have been made happy by the cure of agonizing, humiliating, itching, scaly and pimply diseases of the skin, scalp and blood, with loss of hair.

CUTICURA, the great Skin Cure, and CUTICURA SOAP, an exquisite Skin Beautifier, prepared from it, externally, and CUTICURA RESOLVENT, the new Blood Purifier, internally, are a positive cure for every form of skin and blood disease, from pimples to scrofula.

Sold everywhere. Price, CUTICURA, 50c.; SOAP, 25c. RESOLVENT, $1. Prepared by the POTTER DRUG AND CHEMICAL CO., Boston, Mass.

Send for "How to Cure Skin Diseases."

Pimples, blackheads, chapped and oily skin prevented by CUTICURA SOAP.

Rheumatism, Kidney Pains and Weakness speedily cured by CUTICURA ANTI-PAIN PLASTER, the only pain-killing plaster.

A NEW MICROSCOPE!

The INVISIBLE WORLD Revealed.

Magnifying 500 times in volume. For examining Insects, Trichina, Liquids, Flowers, Minerals, etc. Every instrument warranted. Sent, postage paid, to any address on receipt of $1 00, or six for $5 00. Agents wanted. Sells at sight. Send for circular. UNION NOVELTY WORKS, 10 East 14th St. (Room 21) N. Y.

CATARRH
HAY FEVER
CATARRHAL DEAFNESS

A NEW TREATMENT.

Sufferers are not generally aware that these diseases are contagious, or that they are due to the presence of living parasites in the lining membrane of the nose and eustachian tubes. Microscopic research, however, has proved this to be a fact, and the result of this discovery is that a simple remedy has been discovered which permanently cures the most aggravated cases of these distressing diseases by a few simple applications made (*two weeks apart*) by the patient at home. A pamphlet explaining this new treatment is sent *free* by A. H. DIXON & SON, 337 and 339 West King Street, Toronto, Canada.

Entered According to Act of Congress in the Year 1889, by the Rural New-Yorker, in the Office of the Librarian of Congress, at Washington, D. C.

Floricultural.

Notes from the Rural Grounds.

PROGRESS OF THE R. N.-Y.'S HYBRID ROSES.

TO hybridize other roses upon Rosa rugosa was undertaken five years ago, more as a matter of curiosity than in the hopes that anything of real value would ever come out of it should the attempt be successful. The R. N.-Y. could not learn through inquiry of those who had made roses a study, that this cross had ever been attempted or, at any rate, if attempted, that any seedlings worthy of introduction had ever been produced. One year after our first crosses, Mad. Georges Bruant was announced—a cross between R. rugosa and the Tea Sombreuil. Little is known of this Tea-rugosa as yet. It has the wrinkled leaflets of Rugosa, showing that it is, without any question, a true hybrid, and bears, as we are told, a semi-double flower nearly white in color. Two plants, in pots, were ordered last spring, one from Ellwanger & Barry, the other from Robert Scott & Son. They have made a fairly vigorous growth. Neither has bloomed. Whether it is hardy in this latitude is not, probably, known as yet.

Our first cross, as has been repeatedly stated, was with Harrison's Yellow upon R. rugosa. Of something like a hundred seedlings as the result, but nine survived. Three of these are much alike both in foliage and in flower. It has always seemed a strange thing to the writer that these three roses should bear flowers almost the exact color of Jacqueminot, having for parents a yellow male and a light-pink female. Of the three, the illustration is photographed from the one that promises to be most valuable. The plant is wonderfully vigorous and bears more flowers during June and July than any other rose ever cultivated here; the stems were, in truth, wreaths of roses. The earlier blooms resemble those of Jacqueminot in size and fragrance as well as in color. Later in the season they grow smaller and less double. In this respect it has disappointed us. It seemed as if the bush would bloom itself to death. Probably the real worth of this rose, as, indeed, of the others, will not be known until it has been propagated, either by layers or budded on other stock. We are told that Rugosa cuttings do not strike freely, and it is thought that these seedlings will probably resemble the mother plant in this respect. The illustration shows the leaflets perfectly, and the unfolding bud was selected as a fair average specimen.

THE RURAL NEW-YORKER'S ROSA RUGOSA HYBRIDS.

A BUD JUST UNFOLDING. FIG. 252.

Farm Economy.

HOME-MIXED FERTILIZERS.

ON page 551 of the present volume, the R. N.-Y. gave an account of the samples of home-mixed fertilizers analyzed by the Connecticut Experiment Station. This subject is one in which Eastern farmers are becoming greatly interested. In order that its readers might know more about the value of these home-mixed fertilizers, the R. N.-Y. wrote to a number of the farmers who provided the samples for the Connecticut Station. The following replies open the discussion of the subject:

FROM GEORGE F. PLATT.

By experiments which I have tried I have learned somewhat of the needs of my farm, but yet I do not suppose I have found the best combination of fertilizers. Applications of dissolved bone-black, which supplies little beside phosphoric acid, give me a large increase in grain crops. I have often used this alone for rye. Muriate and sulphate of potash do not seem to be required on my farm except possibly in small quantities. This seems to have been proved by the fact that extra applications of 200 pounds per acre in addition to the usual fertilizers, when applied to potatoes, do not give any increase in yield. This has been tried repeatedly with both the muriate and sulphate. A series of experiments with potatoes under the charge of the experiment station have been carried out on my farm this year. The experiment consists of a dozen plots, each fertilized alike with phosphoric acid and nitrogen, but with varying quantities of potash—from none to a very heavy application. The crop has not been harvested yet; but it will not probably prove much, for blight and rot have sadly interfered with the crop. There was no apparent difference in the growth of vines on the different plots.

I have used Formula 2,239, in the Connecticut Station Report for 1888, for three years on potatoes with excellent results, using 1,000 pounds per acre with no other fertilizer. I have tried other standard brands of fertilizers in comparison with this and found the home mixture the best. I have not the analysis of what the station bulletin of this year calls my corn mixture at hand: but owing to a mistake in mixing, it contains more than double the amount of potash it should have for corn. The analysis gives it a very high valuation, but judging from the corn now maturing, something is wrong in its composition. I have, however, a fine crop of turnips growing on a field fertilized with this corn mixture and ashes. I have found the following formula a good one for corn:

Tankage	500	pounds.
Ground bone	500	"
Dissolved bone-black	500	"
Muriate potash	250	"
Sulphate ammonia	250	"
	2,000	"

I buy my materials early in spring and do the mixing on the barn floor on stormy days. The tools I use are shovels and a screen. The cost of mixing I place at $1 per ton. This is low, but there is little indoor work for my men at that season. There are at least five of our prominent farmers in this town who mix their own fertilizers. No two of them use the same formula, but all are pleased with home mixtures and will probably continue to mix in the future.

New Haven County, Conn.

FROM DENNIS FENN.

The study of the Connecticut Station Report led me to mix my own fertilizers, for the reason that in the early history of our station fully one-half of the goods analyzed were above cost; but as competition became stronger, so much money was not made, and the valuation began to drop off until mostly all were below cost, and I concluded that we were paying too much for what we got, so I began to investigate and concluded that my land did not need as much nitrogen as some others, while it was more deficient in phosphoric acid and potash, and I based my calculation of ingredients on that theory. The most of my cultivated land is a sandy loam and for that reason I use a good proportion of organic nitrogen. Cold, clay land, in my opinion, requires something more warming and stimulating in its effect. My experiments were mostly on corn and potatoes, but as I grow some seeds I saw practical results in those.

As to tools, they are very simple. A shovel and garden rake are all that I need. Until this season I ran the stuff through a small mill that I had for crushing tomatoes, which helped in breaking the lumps. The labor was performed at odd times and on rainy days, when we could not do anything else, so that I make little account of labor. I think the practical results so far are in favor of home-mixing. One reason is, that I now use a good deal of fine ground bone in place of dissolved bone-black, which most of the manufacturers use, and which, I think, is taken out with the first crop, while the other remains in the soil for succeeding crops and as the mechanical condition is such as to carry out the first crop there is still some left for future use. If manufacturers used ground bone the price would be necessarily proportionately higher, while by its use we would get an article of higher value, more lasting in its effect and one costing no more at any time, and sometimes less, thereby saving money and value as well. In my judgment, intelligent farmers are going to take this matter

into their hands, as it is evident that they have paid the manufacturers a good deal of money for mixing, when they could have done it themselves. The enormous expenses of printing, advertising, rents, agents' commissions and salaries, all have to be paid for by the farmer, and he cannot well afford to do it at present prices for his products.

New Haven County, Conn.

FROM N. S. PLATT.

I used Baker's corn manure on corn one year and got a bountiful crop with all the manure broadcasted. I did the same next year and got only a fair crop, the season not being very favorable. I concluded that nitrogen was not needed, and so put but little in my mixture for corn this year; but the season being wet and cool, I now think I made a mistake. The stalks did not attain the size they should have done, though the ears are well shaped and well filled out. I used Baker's Peach-tree manure in growing peach trees in the nursery two years in succession, getting nicer trees than with stable manure. In handling the fertilizers I used an old shovel, as the acid injures a good one. I mixed the ingredients on a tight barn floor. They were dry and mixed easily, three turnings being enough; cost of mixing less than $1 per ton. My peach-tree mixture in results equals Baker's and costs less. I have not compared mine with other mixtures as to results, but by analysis I got the same ingredients at less cost.

Dairy Husbandry.

Wisconsin Butter Winners

How They Won Prizes.

HISTORY OF THEIR BUTTER.

FOOD! COW! TOOLS!

AT the meeting of the Wisconsin Dairymens' Association last February, a number of prizes were offered for best specimens of butter. Immediately after the meeting the R. N.-Y. sent to the winners of these prizes the following list of questions, the design being to secure all the facts possible regarding the history of this prize butter:

1. *What breed of cows?*
2. *How were the cows fed and handled?*
2. *How was the cream cared for?*
4. *How was the butter churned, worked, colored and packed?*

The following answers were received in due time. We have held them until now before publishing them because they refer to winter butter. It is now time to prepare for making winter butter and it seems more timely to give these facts now rather than at the end of the season, when pastures will soon change the whole system:

FROM E. J. FEAR, WINNER OF FIRST PRIZE FOR DAIRY BUTTER.

My cattle are the common native breed, crossed with the Short-horn. They were fed on clover hay and silage corn-fodder that was cut and shocked in the fall; this I haul to the barn and run it through a Smalley feed-cutter, cutting it into five-eighths inch lengths. The cows were also fed a few roots night and morning, and plenty of good, pure water warmed to about 70 degrees. They were kept in a good warm stable in the basement of the barn, and during the cold weather were only out of the stable long enough to drink and allow the stable to be cleaned. The cream was raised by the Fairbank system, kept in a warm room till slightly acid, then churned at a temperature of 62 degrees. It was churned in a rectangular churn, worked with a ladle, salted with Higgins's salt at the rate of one ounce to the pound in the churn. It was colored with Hansen's Danish butter-color, and packed in eight-pound pails. Most of my butter is put up in half-pound prints and shipped in 30-pound cases. For the last three years I have sold most of it in this way, to one of our leading merchants in Augusta, as fast as I could make it. During the warmest weather I put it up in 30 and 60-pound tubs or eight-pound pails. In fact, everthing is done in accordance with the latest methods, my aim being to make as good an article as can be made.

Augusta.

FROM C. P. GOODRICH, WINNER OF SECOND PRIZE FOR DAIRY BUTTER.

Of my cows two-thirds are grade Jerseys, the rest common cows. They were fed on well-cured, early-cut clover and millet hay, and cut, dry corn-fodder. The grain ration, fed at two meals, was 10 to 15 pounds each day, one-half in weight being wheat bran, one-fourth ground oats, and one-fourth corn-meal. The cows were kept in the stable nearly all the time, but let out twice a day to drink warm water from a tank. The cream was raised in broad, shallow pans, each large enough to hold one milking of the entire herd. The temperature was kept at as near 60° as possible, and the cream stood 36 to 48 hours before skimming. It was stirred up so as to mix in each skimming, and was kept at 60°, the last batch not being put in when the churning was done. This was done once in two days. By that time the cream was sufficiently ripened, being slightly acid. Before churning the temperature of the cream was raised to 64 degrees by putting warm water into it. It was churned in a revolving square box churn in 25 minutes. The churn was stopped when the butter was in pellets the size of peas or corn. The butter-milk was then drawn off and the butter washed quickly twice with clear water. It was then taken upon a clean butter-worker and one ounce to the pound of Warsaw high-grade salt was mixed in when the butter was in as moist a condition as possible. After lying on the worker three hours to allow the salt to dissolve, it was worked just enough to distribute the salt evenly and then packed in eight-pound bail boxes which were lined, bottom, sides and top, with parchment paper. This paper prevents the brine from leaking out and also prevents the flavor of the wood from affecting the butter, for these boxes are usually made of elm which sometimes has a bad flavor. The butter was colored with Hansen's Danish butter-color to just the shade of good June butter.

Fort Atkinson.

FROM MISS LEAH ALLEN, WINNER OF FIRST PRIZE FOR BUTTER MADE BY A YOUNG WOMAN UNDER 20 YEARS OF AGE.

Some of our cows are grade Jerseys and the rest common native cows. Papa thinks the care of cows is more important than the breed. They are fed once a day with corn unhusked, stalks and ears together. Each cow has six quarts of meal made from oats and barley and one peck of vegetables, beets and carrots per day. She also has all the good clover hay she wants. This is cut while in early blossom and carefully cured so as to retain the leaves and blossoms. The cows have fresh water, not warmed artificially, but pumped from a deep well. Their stables are warm and are kept clean. The cows are also kept clean and well bedded. They are never exposed to inclement weather, but on pleasant days they are turned out in a well-littered yard for exercise and a good sun-bath.

The milk is set in deep creamery cans and cooled in water and skimmed when 24 hours old. The cream is kept in a tin cream can, each additional skimming being well stirred in. The whole is kept cool until the day before churning when it is set in a warmer apartment and a starter of sour cream is well stirred in.

The butter is churned in a barrel churn. It is well washed with brine and salted while in the granular form; then, after standing about one hour, it is massed by a few slow revolutions of the churn. Then it is immediately packed without any working. We use Hansen's Danish butter-color.

I am in my 14th year. I do not often make butter all alone, but help mamma and always do some part—different parts at different times.

Beaver Dam.

FROM MRS. C. W. FERGUSON, BEST EXHIBIT OF HALF-POUND PRINTS.

I have grade Short-horns and feed good hay and meal with a little bran. I use the Cooley process. The cream is churned in a revolving barrel churn, salted with Higgins's salt, and colored with Wells, Richardson & Co.'s butter-color. I never use a butter-worker. I leave off churning when the butter is in the granular state. I wash it with water at a temperature of about 45 degrees and change the water about four times; then I let it drain a few moments and salt it at the rate of about one ounce per pound. I then mix the salt with the butter and let it dissolve. Then I revolve the churn until the butter comes into balls—sometimes small and sometimes large. Then I either pack it or stamp it without any more working.

Augusta.

FROM NELSON CORNWALL, BEST BUTTER IN PRINTS.

My cows are the common scrubs; but I have been using a thoroughbred Jersey sire for the last year. The cows are kept in a basement barn and I let them out in the middle of the day when it is warm. When it is very cold I keep them in the stable. I feed them corn-fodder in the morning and at noon, and at night I give them good clover hay, and they get corn and oats ground together morning and evening. I have a heater in my cattle tank and warm the water to about 70 or 80 degrees every day. I calculate that one great point in keeping cows is to give them warm water to drink. Then they will give more milk, and it will take less feed to keep them. In regard to the cream, I use what they call the shot-gun cans which are 20 inches deep and eight inches across—same size as the Cooley can. I keep the cream in a cool place till I get enough to churn; then I put the cream in the cans and set it in warm water on the stove the night before I churn and warm it up to 75 or 80 degrees. But before I do this, I put in for a starter about a pint of butter-milk saved from the previous churning, and then I set the cream in a warm room, where it will be ready for churning in the morning. I churn as soon as the cream begins to thicken. I use the barrel churn and churn at 62 degrees. When the butter is about the size of mustard seed I stop and make two or three quarts of weak brine and put that in, and then revolve the churn a few times and let it stand three or four minutes and then draw off the butter-milk; then I get two pails of water and put in a handful of salt and temper it to 50 degrees, and put it in the churn and revolve a few times. I next let it stand for a few minutes, then draw off the water and repeat this operation. I then put in salt (after all the water has been drawn off), about one ounce to the pound, and mix it up in the churn. Next, I revolve the churn a few times, let the butter stand a few minutes in the salt, then revolve the churn until the butter is in a solid mass. I then pack it or print it, as may be, out of the churn. I use no butter-worker, as I think working it spoils the grain. I use Wells, Richardson & Co.'s coloring and the best dairy salt.

Augusta.

FROM JAMES SHIEL—BEST BUTTER FROM JERSEY COWS.

I keep Jersey cows. I feed meal and bran and corn-fodder in a dry state, and clover hay. If I had silage it would be better. I use the Cooley cans and submerge them in water and then turn the cream into a large earthenware jar and keep it till it turns; then I put it into a large, revolving barrel churn and churn until the butter comes into a granular form. Then I put brine in and revolve the churn a few times, and then the butter will be like small shot. Then I draw off the butter-milk and put in water and revolve the churn, and then draw off the water and repeat till the water is clear. Then the butter is fit to be salted. I shake the salt over the butter in the churn and revolve once and salt again. The butter is like shot all this time. Then I revolve the churn over and over till the butter is in one big ball ready for packing. It is packed in tubs. If the butter is to be printed it will have to be worked somewhat with a butter-worker in order to form the prints in good shape. The less working the butter gets, the better.

Augusta.

PHOTOGRAPHS OF BUTTER.

(*See page* 675.)

A GREAT deal has been said by dairy workers about the proper time for stopping the churn. A great deal of this information has been lost, for the reason that it is difficult to *tell* a person just how a thing should look. One glance from an observing eye is worth half an hour's mere talk. The R. N.-Y. conceived the idea of having samples of butter photographed just as taken from the churn—one "just right" or just as good dairymen would prefer to have it, and the other showing the effects of over-churning. Mr. F. E. Benedict of the Victor New York Creamery, who is considered one of the best dairymen in the State, kindly secured the photographs which are shown at Figures 253 and 254. Mr. B. writes as follows regarding the pictures:

"The picture showing large lumps—see Figure 254—represents the over-churned sample, such as a person will find among the majority of farmers. The other sample with particles like shot—see Figure 253—shows the condition in which butter would be when properly handled. The object of having the butter in this condition is that it may be in such a shape that the butter-milk may be washed out instead of having to be worked out, as would have to be done when the butter is churned into large lumps. Cream that is properly ripened and churned at about 60 degrees can be brought to the proper granular condition with a little care in watching the churn. Then by washing the butter-milk *all* out, and working just enough to thoroughly distribute the salt, the butter should be in the best possible condition for immediate use or for keeping."

Sheep Husbandry.

FEEDING FOR WOOL.

A few Opinions as to the Best Ration for the Production of a Heavy Fleece.

FROM F. O. HOGMIRE.

I have never fed for a large production of wool. My experience is that a sheep kept fat through the winter will shear from one to two pounds more wool than a poor one. There is no question that bean pods will produce as much wool as anything else. They keep the sheep healthy, and take the place of grain when grain is high.

Genesee County, N. Y.

FROM FRANK STORK.

I consider good clover hay and corn fodder and oats the best feed for the production of wool. My half-blood two-year-old ewes averaged nine and a-half pounds of wool and raised lambs. I let mine run in a woods pasture, and stable them every night in winter, and also on stormy days.

Richland Center, Wis.

FROM L. B. PEET.

While the sheep-breeders of Vermont are quite at one in their judgment as to the best kind of hay and grain to produce a healthful growth of wool and carcass, no accurate experiments have, to my knowledge, been conducted to demonstrate the exact effects of different foods fed in varied rations. This subject has already enlisted the attention of Prof. Cooke—the director of our experiment station—and he proposes to request several sheep-breeders of the State to conduct feed experiments under his supervision bearing upon this very subject. We shall await results with interest. At present no grain ration is thought to surpass oats and bran, especially for lambs or young sheep. As a rule, little corn is fed to Spanish Merino sheep in Vermont. This grain, however, is a profitable food for fattening well-matured rams for the Western trade. When fed heavily to breeding ewes, it is thought by some to produce barrenness. Beans, peas and, indeed, all kinds of grain are fed by Vermont shepherds; but largely for change, or variety, to please our sheep—we like to see them happy—but oats and bran form the staple grain ration. As the term "horse-hay" implies Herd's-grass, not less does sheep-hay imply clover. This, with mixed grasses, cut the last of June and well cured, is not simply desirable, but seemingly indispensable to the best development of the frame of the sheep, as also to the rapid growth of the wool.

Addison County, Vermont.

FROM HENRY STEWART.

The term "feeding for wool" by no means represents any unreasonable proposition. A sheep having a carcass of 100 pounds live weight may have a fleece of 20 or 25 pounds of wool, including, of course, with the wool, the yolk and oil which ac-

company it and form an indispensable part of the fleece; for these fatty and soapy substances are necessary to the preservation of the fleece and give to it its ability to protect the animal from the inclemencies of the weather, for which purpose it is given by nature to the sheep. An exceedingly heavy draft is thus made upon the vitality and the vital functions of the sheep for the supply of the material for the growth of the wool; and this draft is so heavy and exacting upon the vitality and energy of the animal, that it has been found to interfere largely with the ability of a ram to serve the ewes successfully when the flock has been sheared in the breeding season. This fact is well know to shepherds who thus shear their sheep, and my own personal experience of fall shearing three years ago has given full confirmation to the general knowledge, for of a flock of 80 ewes sheared in September just as the breeding season began, more than half were barren in the spring and of the rest of them many had lambs so weak that most of them died. This result may have been due to the unusually cold, wet season, but if so, it proves that the shearing and its effect upon the vitality of the sheep, heavily drawn upon to renew the growth of wool, were too much tax to enable the flock to withstand the rigor of the season, which otherwise would have caused no special inconvenience.

All this being thus, it follows that if the shepherd must feed for flesh and healthful growth, or for fat to make his sheep fit for market, he must quite as much feed for wool, or he will lose the chief profit from the flock.

The long, lustrous wool of the English breeds which have been bred and reared for this special product, is an emphatic instance of the results of "feeding for wool". These sheep are more highly fed than any others in the world. Turnips, mangels, oil-cakes, corn, certain mixtures of meals and condiments which are known as "special foods," with rich grass, clover, mustard, rape, and other pasture crops are all provided for them, and a fleece of surpassing length, strength, luster and fineness of staple is thus produced. And again it will occur to the experienced shepherd that when sheep are suddenly deprived of sufficient food, or an excessive drain is made upon their vitality by any hardships or neglect, the wool will stop growing or become so weak and thin that the fiber will be pinched and shrunken, and the wool will break under the card and so become useless for the purposes of the manufacturer of woolen goods. Under a microscope which shows so distinctly every portion of a fiber of wool, one may see the evidences of good feeding in the fullness of the strand, its even imbrication, its regular thickness and bright, smooth surface while the effects of irregular and poor feeding are shown in the visible "breaks," the pinched and shrunken places in the fiber, the uneven surface, and its "deadness," all of which impair the strength and lessen the adherence of the felting quality of the wool, which is necessary to fit it for manufacture. That wool is not always wool, is proved by the carefulness with which it is examined and separated and classed by the professional wool-sorters, under whose skillful scrutiny the fleeces must pass before they are submitted to any process of manufacture. And this work of sorting is to a very great extent simply the separation of the wool of ill-fed sheep from that of those which have been well nourished. Doubtless these facts will be new to many shepherds or feeders of sheep, who are apt to think that wool is wool, and the wool-buyer who comes around, of whom it is said—and most truly, too—that he can distinguish a good fleece from a bad one without taking off his gloves, is merely an agent for bantering and beating down the owner whose fleeces are offered for sale, and who is disgruntled when he discovers that the fleeces of the well-fed flock of his neighbor have brought four or five cents a pound more than those of his own straw-fed sheep. Food is the basis of all animal products, and food makes wool as it makes milk and meat and fat; therefore he who desires to have wool, and good wool, and to make profit from his flock, must make "feeding for wool" a special study and regular practice.

Studious readers have recently been interested in the results of experiments made by Professors Henry, Roberts and Sanborn, at the different experiment stations in regard to feeding for lean meat, and although the reults were all known and proved by old experiments made years ago, yet they have been most interesting and useful to those who have not known of the valuable contents of standard agricultural literature. In these experiments it was shown how the lean meat of an animal, the muscular fiber of the muscles and the tissue of the vital organs, were developed and increased by the use of nitrogenous foods. All this, of course, went without saying to the expert physiologist who knows that "out of nothing nothing comes," and that one cannot produce nitrogenous flesh without using nitrogenous food. Now all this is of the closest connection and analogy with the subject of feeding for wool. Let us consider well the following table:

PHOTOGRAPH OF BUTTER CHURNED "JUST ENOUGH" FIG 253.

	COMPOSITION OF				
	CARBON.	HYDROGEN	NITROGEN,	OXYGEN	ASH.
PER CENT.					
Dry Flesh..	51 83	7.57	15 01	21.37	4.23
" blood..	57.96	7 25	15·07	21 30	4 42
" wool...	50.65	7 03	15.71	21 11	2.30
" hair...	51.53	6.69	15 98	21.84	0.72

If the figures are added it will be found that there is a deficiency in those relating to wool and hair of 3.50 and 3.25 per cent. respectively, and this deficiency is the quantity of sulphur contained in those substances. Wool, then, or hair, which is identical with wool in composition, differs only from flesh and blood in the amount of sulphur which it contains; and this being the case "feeding for wool" as a special art and practice of the shepherd, is as indispensable to the product of the fleece as the feeding for flesh is to the production of meat, and nitrogenous food is as necessary to the welfare of the flock as it is to the growth of the herds.

But wool cannot be grown without its accompanying yolk and a sufficient quantity of fat or grease to keep it soft and pliable, and to prevent it from "cotting" or felting upon the sheep's back. Rain causes dry wool to mat and felt in masses, to the destruction of the fleece and the injury of the skin, so that the character of the yolk must be taken into account. This yolk is not fat but a true soap, a mixture of alkali (potash) with various fatty acids; and contains about 30 per cent. of potash salts, (carbonate, chloride and sulphate), with nearly 60 per cent. of the fats; and the resulting soap is soluble in water. The yolk would then be quickly washed out of the fleeces were it not that it is protected by the grease of the wool which causes the fleece to shed off the water.

This is a beautiful (because useful, and every natural provision for the useful is beautiful in its adaptation and fitness) provision of nature for the welfare of the sheep and the profit of the growing wool; and his business (a part of the dominion over nature given to man) is to provide the necessary aliment for the flock that will secure these results.

What then should "feeding for wool" consist of? First, the food should consist of such general nutritive elements as will sustain the sheep in the most perfect health, and then such elements should be added as will furnish the excess of nitrogen, sulphur and fat, that will contribute to the quantity and quality of the fleece.

PHOTOGRAPH OF BUTTER CHURNED TOO MUCH. FIG. 254.

By general consent of shepherds and the result of a long experience, clover, either green as pasture or dry as hay furnishes the best staple nutriment, as it contains a large proportion of nitrogenous matter, while clover, wheat or rye bran makes an excellent additional food containing the necessary nitrogen, with fat and potash. Pea straw is an especially useful winter food: it is rich in potash and nitrogen and is much liked by the sheep; and, as a rule, the appetite of animals is a guide to what is good for them. Corn, while it contains all the elements required, the fat especially is for some reason not healthful for the sheep and the experience brings up a point of the greatest importance in this consideration. Food must be healthfully digested and assimilated, or it is injurious instead of being useful. Dry fodder and hard grain are fed in the winter and it is the winter feeding that is the most to be considered. Summer grazing on young grass or clover, both Red and White, is all that is required for the most healthful growth of the sheep and its fleece, having in it every needed element in the most digestible form and being sufficiently active upon all the animal functions to assimilate the digested food and to excrete all the waste. But in winter feeding on dry, hard food, the excreting organs are not acted upon sufficiently and much trouble ensues to the careless or unskillful shepherd. Consequently some provision must be made to avoid this trouble, and the use of some succulent food is indispensable to the thrift of a flock. Mangels, ruta-bagas or turnips supply this laxative and succulent food in the most acceptable form and should always be provided. The effect upon the wool is especially notable. Roots aid in healthful digestion and have an exceedingly favorable effect upon the bowels and kidneys, ridding the system through these channels of the wastes which otherwise would be retained or be forced to pass off through the skin and lungs, thus causing serious interference with the functions of these organs, and without a healthy skin, healthy wool is impossible. Beyond a doubt, the general absence of roots for winter feeding is the cause of the common troubles incident to the keeping of sheep through the winter. Nor will it do to use medicines to avoid the troubles so arising. If the sheep require a certain quantity of sulphur or potash to supply their needs, we cannot give these in their common form: they must exist in the food, and pass into the blood as aliment.

In my own experience I have found frequent changes of food very useful, with clover hay for winter feeding as the staple. I have used a mixture of coarsely cracked corn, oats, rye and buckwheat, one pint per head, given twice a day, in a broad, shallow trough so that the sheep cannot swallow it too fast; a V-shaped trough is objectionable in this respect. A quart of cut roots sprinkled with bran, per head, given once a day; sheaf-oats fed in a rack in place of the mixed grain; pea-straw, or oat-straw, and corn fodder (the leaves only), and when the weather permitted a run in a corn stubble or a meadow of which the aftermath had been left for this purpose, have been desirable. An ample supply of fresh water from a well only, has always been a particular part of the regimen. Salt of course is a regular part of the feeding, and for safety (for excess in this is injurious) it is best provided in the form of lumps of rock-salt placed where free access can always be had. Whether ensilage can supply the use or advantage of roots I cannot say, not having tried it, but I would rather use the roots, which are unquestionably excellent and always the same.

Macon County, N. C.

FROM COL. F. D. CURTIS.

In order to get a good fleece the sheep must be kept in vigorous condition. Many farmers suppose that fat is the same as vigor. Not so. It is one thing to feed for vigor, and quite another to feed for fat. In order to obtain vigor we must sustain and build the muscles and furnish food to make activity. To produce fat requires food to fill up the tissues and to store up material for heat and life, or existence. This condition is attained by rest, quiet and the consumption of starchy and oily foods—the carbohydrates—while vigor comes from the use of the albuminoids or the feeding of bran, oats, linseed-meal and foods abounding in muscle material and the phosphates. Wool is produced more by foods of this nature than by the heat and fat-forming kinds. We, must, then feed the fleece and at the same time feed the body which is to produce it. If the body from which the wool is to come is made feverish there will be a failure, and if the foods be too stimulating the sheep will shed what wool it may have. A moderate amount of oily foods is required to furnish the oil the wool should have, and it is for this reason that farmers many times imagine that there is nothing like corn for sheep, as it is so full of oil and starch. Corn is not the best food. A little corn in winter is all right; but in summer I would not feed it for wool-growing. The foods which will conduce the most to

bodily growth will make the most wool. This is so for several reasons. First: to have a good fleece the blood must be cool and well nourished; that is to say, it must not be thin and lacking in nutritive elements. These elements must be complete for feeding all parts of the body, including the skin and its inner coats. A dry, impoverished skin will never support a good fleece. It must be soft and full of secretory life. When corn or rye or barley or other heat and fat-forming foods are fed, the skin is made dry and the wool is liable to become loose. I have known sheep fed highly on corn to shed their fleeces in midwinter. I conclude, then, that foods, naturally so disposed to produce fever are not the best for promoting the growth of wool. Second: to produce plenty of wool the body must be in the most healthy condition as regards its digestive functions, and all its physical wants must be fully supplied. Poor sheep always have light fleeces, but it does not necessarily follow that fat sheep will have large fleeces. It is true that the fleeces of fat sheep will exceed those of thin ones; but it is equally true that in the end the effort to produce large amounts of both fat and wool may be overdone. A full-growing and vigorous condition in the sheep is the best. The wool thus grown will be of the best quality and this is an important item. I have obtained the best results in wool-growing by feeding a mixture of wheat bran, four parts; linseed meal, one part, and oats one part. In winter I have added as much corn as oats; but this was with an idea of improving the condition of the sheep, that is, making more fat. With sheep in good condition, I would leave corn out. This mixture, in proper proportions, is always safe for ewes or lambs. It is a complete food. When clover hay is fed, a quart, twice a day, is a liberal ration for ewes, and half of this quantity for lambs. When Timothy hay—(the curse of sheep) is fed, more of the grain ration should be given. Sheep will do well on good straw with this grain mixture. Good oat straw is equal to Timothy hay, especially if the hay is coarse and ripe.

Sheep abominate filth and bad smells. Everything must be clean when they eat, and the food must be fresh at each meal. Two full feeds are enough in a day. They should have access to water all the time and also to salt. As soon as cold, or even chilly weather sets in, they should not be allowed to get wet. When they are wet or chilled the wool does not grow: the whole vitality of the animal is required to overcome the chill. Such exposure will spoil the fleece as it will cause breaks or weak places in it. The sheep is an every-day animal. It dislikes changes and excitement, and such disturbances all conduce to the production of shorter wool and a weaker fiber.

Saratoga County, N. Y.

Rural Topics.

SOME MORE CROP ROTATIONS.

FROM T. B. TERRY.

Our rotation is clover, potatoes and wheat. Then clover with a little Timothy is sown on the wheat again. A few years ago the rotation practiced was:

1. Clover and Timothy.
2. Clover and Timothy.
3. Wheat.
4. Potatoes.
5. Early potatoes.
6. Wheat, seeded to clover and Timothy.

The clover sod and good tillage brought as large crops of wheat as could stand up, without manure or fertilizer. Then all the manure was put on for potatoes. What the potatoes left and thorough tillage insured another large crop of wheat. This rotation was followed for some time with paying results. Clover was sown on wheat, and plowed under for the following potatoes, and rye on potato stubble and plowed under for next crop. But I consider the short rotation now practiced (three years) as best. In one respect it is necessary, as we cannot now keep land in clover two years in succession on account of the clover-root beetle. Nor do I now want to. The clover yields the largest crop of hay the first year. At the end of that year it has made the largest growth of roots possible; then is the time to end it and grow a large crop of something else, if one wants to make the most money possible. Again it is no longer safe for us to put fresh manure on land for potatoes, and I want to put it out before it rots. So we want the clover sod to grow the potatoes now instead of wheat. Also, it isn't best to grow potatoes (or any other crop) two years in succession on the same ground. With our old rotation we only had to get off potatoes in time for wheat sowing from half the wheat ground, as half came after clover.

This was a great help. But I decided to do the best way and take the straight three years' rotation, although it gives us a hard pull to get the potatoes dug and stored in good season for wheat sowing. We put in the cellar yesterday 300 bushels of potatoes, making 1,200 now in, and there are some dreary days ahead yet, before we can ride our Cutaway harrow at our ease. I am writing this before breakfast, little by little each morning, as working hours are precious just now; so please excuse any lack of connection.

Now with my new rotation the rub was where to put the stable manure. I took the risk last year and put it fresh on the clover sod for potatoes. I paid dearly for the job. We had to pick over by hand 1,500 bushels of potatoes and take out some 200 of the worst scabby ones. On a field without stable manure the potatoes were nice and smooth. I am done with that kind of business. But one of the strange things is that neighbors on each side put fresh manure on potato land and it did not produce scab. Did my cement floors and covered manure shed have anything to do with this?

This spring I put the stable manure, early, on to six acres of newly seeded clover, where I had wheat last year. It was carefully done with the spreader. Then the young clover was cut about the middle of May and left to dry up. The next growth made an enormous crop and we let it ripen. It is full of seed. I expected the manure would cause much trouble raking up with the clover (I cut seed with Eureka mower and rake with a horse rake, thinking it about as good a way as any); but I hardly saw a trace of it. There was a large amount of straw in it when I put it on; but it seems to have decayed, giving the surface of the field a darker, richer look than it had in the spring. It would not have answered probably to have cut this lot for hay; but while handling the clover so as to dodge the midge and get a crop of seed, I got my stable manure nicely rotted on the surface, and I think without any loss to speak of. I am rapidly getting my eyes open as to the value of manure, or even straw, on the surface as a mulch aside from the amount of fertility it actually has in it; but I cannot stop now to give my experiences.

Now, unless I am greatly mistaken, that field thus treated will give me a heavy crop of potatoes next season. The clover haulm after hulling will be spread back. The seed clover is stacked in the field. If I could have a four-year rotation and put in ensilage corn one year, then I could put my stable manure on clover sod for corn, to be followed by rye to be plowed under in the spring for potatoes. I should like this, but cannot figure how I could feed out the silage to a dairy and do any better than we are now doing. It would necessitate another family, as we are crowded now to take care of everything on time on our little farm.

My potatoes this year were manured with clover only, in the shape of a heavy sod (I mean just what I say—not a Timothy sod with a little clover in it) and second crop and haulm from seed plowed under. The potatoes are smooth and free from scab, and the yield exceedingly satisfactory, although no stable manure has been applied since the last crop of potatoes was grown. If I could let all clover and straw go back to the land directly, I would need no stable manure; but I need to use a part of it to feed out and for the comfort of stock, and I guard the resulting manure with zealous care to get it returned without unnecessary loss to the fields. But it must go on in some way so as not to make my potatoes scabby.

Summit County, O.

FROM FRED GRUNDY.

The crop rotation most generally employed by the best farmers in this section is corn, oats, winter wheat and grass. The corn is husked, and if the field is inclosed by a fence, the stalks are pastured whenever the ground is dry, or frozen hard. In the spring the stalks are cut with a stalk-cutter drawn by two horses, the land is plowed very shallow and the oats sown. Some farmers who from lack of fence are unable to pasture the stalks, cut, or break them down immediately after the corn is husked, and plow the land for oats, turning the stalks under. This enables them to get their oats in as early the following spring as a harrow can be drawn over the ground.

Immediately after the oats are harvested the land is again plowed and allowed to lie until about the first of September, when it is pulverized with common harrows, Disks, Cutaways, or heavy pole or railroad iron drags, whichever will do the best job. Some seasons the soil is loose and as mellow as ashes at this time, and the clods will crumble at a touch; in others it as hard as a road and the clods are like stones. A good shower at the right time makes everything lovely. The wheat is drilled in and Timothy is sown broadcast afterwards. Clover is added, if desired, the following spring. One or two crops of grass are cut for hay, or it is pastured a year or two, then plowed and put in winter wheat, or corn, whichever the owner thinks will pay best at that particular time. Most of the farmers in this section aim to employ the above described rotation as nearly as the seasons will permit. The general sentiment is that it will average the best results—yield the greatest quantity of paying produce in a series of years.

FACTS FROM FARMERS.

BUYING SEED POTATOES.—Why is it that a majority of farmers in the Western States, especially in Illinois, import their seed potatoes from some Eastern or Northern State; mostly from New York or Michigan, when we, here in Illinois, can and do raise just as good potatoes as are produced in any other State in the Union? I know to a certainty that millions of dollars go out annually from Illinois alone for seed potatoes. This money might be saved to the farmers of the State if they would only take a little pains to select the best of their own tubers for seed and keep them through the winter where they will not sprout much. I am certain from my own experience that sprouting injures their vitality. I believe that my potato crop has been injured both in quantity and quality by planting imported seed. I have now on my farm, grown this season, as fine Beauty of Hebron Potatoes as one could desire from seed grown year after year for the last six years on the same land by selecting good potatoes of medium size and keeping them where they did not sprout much. My advice is that farmers should raise their own seed potatoes and plant them and keep their money at home.

Wheat is making from 15 to 25 bushels per acre, and some extra pieces go as high as 35 to 40. Oats make 35 to 60 bushels per acre. Corn on upland is a good average crop. Potatoes never were any better in yield or quality. Hay was a heavy crop but bad in quality. There was too much rain to allow it to cure well, and a large amount was damaged more or less.

Shelbyville, Ill. E. J. M.

WATER IN THE SPADING FORK.—The second year of a transplanted tree's life, if the first year has been very dry, is a critical time. My pear orchard of about 800 trees planted a year ago last spring, came through the summer all right, with a loss of only two trees, though no rain fell during the season to wet the roots. The orchard was plowed early last spring; a strip of only about a foot and a-half being left along the rows. But the extreme drought of April and part of May began to tell badly on the trees. I set a man at work with a spading fork, fining the soil four to six inches in depth, three feet in diameter. It cost me about three dollars, but I think I never spent money better. An improvement could be seen in the trees within 48 hours, and not half a dozen have died during the summer. Of about 100 trees set in a nursery row at the same time as the orchard, but neglected last spring, about one-half have been lost. W. F. B.

Ann Arbor, Mich.

The Poultry Yard.

CONFINEMENT OF POULTRY.

P. H. JACOBS.

THE domestic fowl, like all birds, thrives best when at liberty. Of all things it detests most being confined in a building. Some breeds have been bred to a form and disposition partially favorable to confinement in yards, where they can enjoy the open air, but no breed will willingly remain indoors if it can be avoided. At night, however, seclusion is desirable, and the hens will also seek a secluded place for lay ing, but during the day the light and open air add more to the thrift of fowls than anything else.

The difficulty of confinement within the building is easily met during the summer, or when the weather is favorable, but when the cold is severe the poultryman finds it a serious obstacle; as the fowls cannot exercise to advantage, they get out of laying condition, and become injured if exposed. As the winter is approaching all arrangements of poultry houses must be made in advance at this season, so as to be prepared in time for the change.

No poultry houses can be constructed that will be suitable for all seasons, and it is a fact that no design of a poultry house nas been accepted as the best. A visit to large poultry establishments will show that opinions differ, and it is seldom that any two poultry establishments have buildings of the same design. In fact, it is not often that two buildings on the same poultry farm are alike. The "best poultry house" is still an unsolved problem. The cause is that houses built for winter use are too confining. No matter how comfortable they may be, the hens must be fastened within, or they will prefer the cold outside during the day. For this reason the cheapest kind of poultry houses have sometimes given satisfaction where better houses have failed.

But in the cold periods of winter the hens must not be exposed to the open air, if the wind is in certain directions, or they will have frosted combs, become subject to colds or roup, and fall off in egg production. If, however, some kind of covered run, or open shed, be provided, facing the south, forming a wind-brake, the hens will do well, provided they have litter in which to work. This is the secret of success with the farmer's fowls. They are not so much exposed, as a rule, as may be supposed, for the wagon shed, barn sheds, or any covered location, will be appropriated by them, where they enjoy the open air without being exposed too much. If they were cooped up in walls as closely as are some of the pure breeds they would perish, for the more active the fowl the greater its repugnance to confinement. A fowl loves a warm place at night, free from draughts, and it will seek the most sheltered and protected spot, even in the poultry house, at night, but during the day it prefers the lightest and warmest that admits of the nearest approach to the open air. To turn them into the yard is no substitute, as they should be so situated as to be able to scratch and work all day without being affected by winds or rains.

Leghorns, and other active breeds, if kept within the poultry house, no matter how ample the floor room, will soon become addicted to feather-pulling, egg eating, etc. They will also worry, and fail to lay. They are naturally busy, but they prefer to work in the full light. Brahmas will be found more contented, but they, too, will thrive better when they can be given a protected location outside. The poultry house should really be used for laying and roosting only, and not for confining the fowls during the day, in winter.

CHICKS AS GARDEN ASSISTANTS.

FRED. GRUNDY.

WHEN hoeing or raking in the garden I am constantly turning up numerous worms, grubs, bugs and beetles of various sizes, kinds and color, and if I stopped to slay each and every one of them I should make very little progress. If I passed them gently by they would continue to gnaw, uproot and destroy my favorite vegetables, wax fat and keep my wrath at a boiling point.

How to compass their destruction expeditiously and cheaply was a problem I pondered much. But I have solved it at last, and now not a bug, grub or worm that my hoe or rake uncovers has time to be astonished before, presto! he finds himself amid the rocks and broken crockery in the interior of a healthy chick, where he is soon reduced to pulp.

I never want less than five fair-sized chicks nor more than a dozen small ones with me. If there are not enough they get full too quickly and retire. If there are too many, they get in the way and some of them meet with accidental destruction. It is amusing in the extreme to see half a dozen or so of them dancing about on either side watching the progress of my implement, and when a choice morsel is exposed pitching over each other in their eagerness to get it. Occasionally one becomes too fresh and gets knocked over, but they soon learn about how near it is safe to venture. One lot I had in the early spring always followed along be-

hind, but the little mob I have now keep constantly circling around me. All were hatched in an incubator and reared in a brooder, and are sold as soon as they weigh 2½ to three pounds. Those hatched by hen power must be taken from the hen as soon as hatched and reared in a brooder or they are no good as grub gobblers. They are afraid to leave their mal and you don't want her along to work ruination.

I have done a good deal of hoeing and raking in the garden and among the strawberries, etc., this season, and of all the thousands of grubs and worms I turned up I am satisfied not half a dozen escaped the vigilant eyes and nimble beaks of my chicks. They have also kept the lawn, flower beds and garden entirely free from grasshoppers, while there are thousands among the clover not 300 yards away. About 20 are enough to have around, and as soon as they begin to scratch hard they should be sold or shut out and another lot of small ones brought in.

Everywhere.

RURAL SPECIAL REPORTS.

Canada.

STAMFORD, Ontario, September 16.—In this township the early potato crop was an entire failure. The bulk of the crop was cut with frost on May 29, and the wet weather following prevented the farmers from planting in a seasonable time. The late crop is poor, thin and stinted, and cannot exceed one-third of an average. What potatoes we have are sound, but small, and they are now past growth, for they have perished from drought. What I have said of the potato crop in the township may be said of that in the county. Corn is also almost an entire failure, and so are apples, plums, peaches, grapes, oats and barley. Peas are just medium and wheat an average for the county—about 15 bushels per acre. Hay we have in great abundance. Rain is falling just now and a fine growth of early-sown wheat may be expected.

G. G.

Illinois.

TISKILWA, Bureau County, September 18.—While the potato crop is generally good in this section, there are many small ones in some fields and some entire failures; but there is no rot, except a little dry rot. We have had too much dry weather especially for late kinds, and many did not plant very early, which was bad. Polaris and Queen are among the very best earlies, but Ohio and Ohio Jr. have done splendidly and I find very few small ones among them. Minister was planted too late to do specially well. I am well pleased with the Rural No.2. There isn't one misshapen tuber in the whole lot. They are white and solid; form about perfect; eyes shallow; quality fine, dry and floury and of good flavor; vine, good and stocky and where moisture held out the yield has been fine. Among the new earlies doing well is Burpee's No.37, and 1889, and Mrs. Foraker, and two or three Polaris seedlings. We have had no trouble with Colorado beetles; the pests disappeared after summer had set in. There were myriads of them early in spring, but May and June were very wet and cold and the unfavorable weather seemed to exterminate them. A new insect appeared on some of my potatoes last year. The weather was very wet—the soil rich. I first noticed that the leaves were completely perforated and eaten up, only the stems were left; all the mischief was done in a few days. The insect was apparently without wings and of a dull lead or gray color, slimmer than the Colorado beetle, but nearly as long, and of about two-thirds the size. I had seen none before, nor have I seen any since. After all, the Ohio is the great favorite potato being of fine size and early, yielding few small ones and being such a fine keeper. Potentate ran it hard in all respects, but is not so early.

J. W. B.

Kansas.

PARSONS, Labette County, September 25.—The thermometer this morning stands at 44 degrees, being the lowest point reached this season. The country, except as regards corn-stalks, is entirely green. Corn will soon be ready for gathering, and when this is done the farm work for the season will be over, excepting the care of the stock and other trifling jobs. The season has been nearly all that could be desired. Small fruits and vegetables have been such great crops that the demand for apples has been and continues to be light, and though the crop is poor, the price is low, being 40 cents per bushel for choice, and 15 cents at evaporators. Grain was a large crop. Prices are as follows: Wheat, 55 cents; corn, 20 cents; oats, 18 cents; potatoes, 40 cents; butter, 12½ cents; eggs, 12½ cents; coal, 10 cents; steam coal, $1.00 per ton by car load.

J. B.

Michigan.

HART, Oceana County, September 23.—Crops of all kinds have been unusually good, except apples. Other fruits are abundant, especially peaches and plums, for which our county is especially noted.

THE FARMER'S CLUB

ANSWERS TO CORRESPONDENTS.

[Every query must be accompanied by the name and address of the writer to insure attention. Before asking a question, please see if it is not answered in our advertising columns. Ask only a few questions at one time. Put questions on a separate piece of paper.]

FIGHTING THE CURCULIO.

J. P. A., Tallahassee, Fla.—I have seven or eight peach trees scattered about my place, which every spring bloom abundantly and set fruit, but hitherto the crop has amounted to little or nothing on account of the curculio. Jarring the trees has been tried without any perceptible result. Last spring I changed my tactics. In some of the trees I suspended rags soaked in coal tar among the branches. Around the trunks of others I wrapped bandages covered with the same material. On others I sifted thoroughly peroxide of silicate, repeating the operation several times during the season, and in two cases I combined all these methods. The result was satisfactory beyond my highest anticipation. The trees all bore full crops of luscious fruit, the first they had ever produced. Of course I was pleased, but still not altogether happy, for I had hoped to be able to tell from the result which of my methods was most efficacious. Judging from the result, they all seemed to be about equally good, and several questions I had hoped might be partially solved, as far at least as might be by a single experiment, were left in doubt; for instance:—does the odor of the tar repel the insects from the trees? Do the insects crawl up the trunks of the trees? Will the insecticide kill the insects on the leaves before they puncture the fruit? And, finally comes the depressing query whether all my precautions may not have been without effect after all, and may not the result have been caused by some other influences beyond my knowledge, especially as this was an exceptionally good peach year in all this section? What does the R. N.-Y. think about these questions? I ought to have said that the earliest kind, the Peen-to, were destroyed as usual. Perhaps I did not begin soon enough with them; but the medium and later kinds soon began to show that the ravages were stayed. A word in regard to peroxide of silicate: Is it certain that there is arsenic in this preparation? There certainly are salts of copper, as I ascertained by stirring some up with water with a knife blade. This was soon covered with a coating of pure copper. I found the powder injurious to beans and tomato vines, but having no effect on cabbages, while the cabbage worm and lice were quickly destroyed by its application. I think it a valuable insecticide, but one which should be sparingly used on tender vegetation.

ANSWERED BY PROF. A. J. COOK.

I think it quite probable that this inquirer would have had a crop of peaches even if he had done nothing at all. I have never tried coal tar, but I have tried crude carbolic acid in precisely the same manner, and with no advantage at all; indeed I saw the curculios laying their eggs close by the ill-smelling cloths. The curculio is a good flier, and so wrapping the trunk could not keep the "Little Turks" away. I have often wrapped the trunks of plum trees with cotton drenched with turpentine, kerosene, carbolic acid, etc., etc., but with no advantage at all. The third substance I believe contains a little arsenic with a great deal of plaster. No doubt this would do good. The experiments of Professors C. M. Weed, S. A. Forbes and myself show conclusively that the arsenites are effective if kept on the fruit. But why buy these substances? Why not purchase Paris-green and plaster, do one's own mixing, know what we are using and save money? It seems great folly to purchase "Slug-Shot," "Silicates" or "Zoektein," when we can as easily and much more cheaply buy the poison and dilutant, and do our own compounding.

PLANTING AN ORCHARD.

J. K. C., South Whitney, Ind.—I am going to set out an orchard of 100 apple, 25 plum and 25 pear trees. The ground where I intend to plant them is now in small clover. I expect to plant this fall. How far apart should the trees be planted, and how should the soil be prepared?

ANSWERED BY PRES. T. T. LYON.

It will be difficult properly to prepare a plot of ground for planting under the proposed conditions, since, if plowed under at once, the clover will not have decayed sufficiently to admit of cross or replowing in season for tree planting this fall. I deem it preferable to turn the clover under as soon as practicable, leave it in that condition through the coming winter, and re-plow and plant next spring. Nothing is said respecting the purpose of such planting. If a market orchard be desired, the product to be sold at wholesale, I would suggest a single variety of apple—probably Baldwin—and one variety of pear—the Bartlett—as adequate for the purpose. If a succession be desired to supply a local market, I would name Red Astrachan, Maiden's Blush, St. Lawrence, Jonathan, Baldwin, Stark, and, perhaps, Golden Russet; and for pears, Clapp's Favorite, Bartlett, Sheldon, Howell, and Anjou. If, instead, a family orchard be desired, with succession, a good selection of apples will be: Primate, Red Astrachan (for cooking), Jefferis, Sweet Bough, Lowell, Dyer, Shiawassee, Jonathan, Hubbardston, Rhode Island Greening, Baldwin, and Golden Russet. Pears: Summer Doyenné, Tyson, Rostiezer, Belle Lucrative, Sheldon, Seckel, Anjou, and (for winter) Lawrence, and Dana's Hovey.

TOUGH PORK.

H. C. A., Lansing, Mich.—What is the cause and what a preventive of toughness in pork? I never keep mine till it is more than one year old. The hogs are fed almost entirely on milk and corn. Even the fat is tough, and the lean fibers are hard to cut when boiled even till they fall apart. I have been on the farm two years and this has been the case both years.

ANS.—Milk certainly does make tough, hard, dry pork. Our friend's trouble is probably due to the excess of nitrogen in the milk, and its almost entire use as in the case mentioned. But if the young pigs only are fed on the milk, and when put up to fatten they are fed on corn, or corn and potatoes cooked together, the meat will be tender and juicy. An excess of nitrogenous food tends to make lean, which is fibrous and hard unless it is largely mixed with fat interspersed through the fibers, forming meat that is known as "marbled." The art of feeding for meat is based on the use of a judicious mixture of carbonaceous and nitrogenous matters in due proportion. It is well known that no meat is more tender or juicy than an old animal properly fattened. Such meat is supposed to be made by several months' feeding on good pasture and grain, and is generally thought to be young, and is always tender; but the cause of this is that the mature, dry, tough, fibrous muscles become filled up with fat, making the meat tender and juicy. Hence the use of carbonaceous food, as corn, oil meals, etc., is necessary in the finishing of any animal used for meat.

HOW TO MAKE A LAWN.

B. M. C., Point Comfort, Va.—What is the best way of making a lawn on land that has been under corn for several years? The house is to be built next spring, and is intended as a summer home here on tide-water. Would it be well to commence to make the lawn this fall, or wouldn't it be better to wait till the house is completed?

ANS.—We should begin the lawn at once by grading, plowing and harrowing now. If the soil is not fertile, plow under at the rate of 75 tons of old stable manure to the acre. Leave it thus until early spring. Then use a Cutaway or other similar harrow, finishing with a smoothing harrow or by hand-raking. Sow as early in the spring as possible at the rate of not less than *five* bushels of Red-top to the acre. First sow half of it and rake the entire surface again so as to incorporate the seed with the surface soil. Then sow the rest crosswise and again rake. Finish by rolling it as soon as the soil is dry enough not to stick to the roller. You may use Blue-grass instead of Red-top if you prefer, or half of each. We should sow no other variety. Do not sow White Clover. A further dressing of, say, 1,000 pounds to the acre of raw-bone flour and from 25 to 50 bushels to the acre of unleached wood ashes would be desirable if a first-rate lawn is the object.

MAKING CHARCOAL.

L. M., Augusta, Ga.—Where some friends of mine live there are no pine trees, and they have tried to make charcoal from oak without success. How can it be done?

ANS.—Charcoal may be made from any kind of wood, although some kinds make better charcoal than others. As a rule, the softer woods—those having the least mineral matter and being therefore less dense—make the best coal. Willow wood is used for the charcoal used by gunpowder-makers, because, having very little mineral matter, it is more completely consumed and leaves very little ash. But in this case perhaps the coal is not well burned. To make good charcoal from oak, long, slow burning is necessary. The pit should be well aired at first to get the whole of the wood fired, and then the draft holes should be closed, except so much as to keep the fire from breaking out. If the oak wood is split small and closely packed the coal will be better. But, at the best, oak coal will not burn as well as pine or chestnut coal will, needing a greater draft to maintain combustion.

BERRIES.

W. H. S., Fillmore, N. Y.—1. What is the best time for setting out berry bushes? 2. Which are the hardiest and best varieties for family use? 3. Would a snow-drift on strawberry bushes be a benefit or would it be likely to smother the plants? 4. Is it too late now to set out strawberry plants?

ANS.—1. Early spring for strawberries; also in August. For raspberries and blackberries fall or spring. 2. Strawberries: Cumberland, Chas. Downing, Parker Earle, Prince and Sharpless. Raspberries: Turner, Cuthbert, Springfield. Blackberries: Agawam, Kittatinny 3. Snow gives a first-rate protection on well-drained land. 4. It is rather late. Wait until spring.

Miscellaneous.

D. C. A., Cattaraugus, N. Y.—Do pears do well grafted on the apple?

ANS.—No. They are short-lived. The R. N.-Y. has tried it and speaks from experience.

C. R. W., Westfield, N. J.—How can I get seeds from the "Seed Store" at Washington?

ANS.—Write to one of the Senators from your State, or the Congressman from your district, or to the Commissioner of Agriculture, Washington, D. C.

F. P. Q., New York City.—What is the origin of the Chili Squash, and where can pure seed be obtained?

ANS.—It first appeared in J. M. Thorburn & Company's catalogue in 1869—we are not sure, but think the original stock was first grown by W. S. Carpenter of Westchester County, N. Y. Pure seed can be had from any of our well known New York City seedsmen.

W. L. B. (address mislaid).—1. Where can I procure nitrate of soda and what is the cost of the same per cwt? 2. How should grape and strawberry seeds be planted?

ANS.—1. Of any of the fertilizer manufacturing firms. See advertisements in the RURAL. The cost is about $6 per bag of 200 pounds. 2. You may plant the seeds either in the open ground or in pots or boxes in the house. Grape seeds planted *now* in drills will sprout next spring. Plant the strawberry seeds just as you would tomato seeds.

Discussion.

THE FERTILIZATION OF STRAWBERRIES.

J. A. F., TERRE HAUTE, IND.—It was with pleasure I noted two recent articles in the R. N.-Y., (see page 385, and also Prof. Budd's remarks on page 429), taking the same view as to the fertilization of the strawberry as set forth by myself in these columns last season. It required some courage to suggest that the world might

be mistaken as to this point, and it is agreeable to get some support. The more I reflect on this subject the more fully I am convinced that not only is it a fallacy to suppose that a bisexual influences the fruit of a pistillate as to size, shape or quality, but also that it affects it at all—practically I mean. As to the former point it is purely a theory, no facts to prove it having been brought forward to my knowledge. I do recall some experiments made at some experiment station and reported with illustrations, but instead of proving the theory, they showed variations no greater than can be observed any day in any bed of berries. As to the mere fertilization of pistillates from outside plants, the question cannot be so summarily dismissed; but there are both facts and arguments to disprove the assumption. The Editor of the RURAL says that "actual tests have been made and it has been found that purely pistillate flowers, if protected from pollen, do not form berries." If the strength of this statement lies in the word "purely," then its truth may be admitted; but if it allows that such varieties as Crescent and Manchester are properly called pistillates, then there is proof on the other side. In my former article I mentioned the fact of a good crop having been grown from one of these so protected, and of another grown in a field a-quarter mile distant from other berries, and now Mr. Proctor tells of his growing a fine crop of Jersey Queens 600 yards away from other sorts. A failure of a crop of pistillates when isolated does not prove the need of a bisexual, for it may have resulted from some other cause. I have had failures from perfect-flowering plants and they could not be attributed to a lack of pollen. On the other hand, the production of a crop when isolated, is positive proof that a bisexual is not needed.

The facts so far seem to be on our side and when we reason on the matter, the same conclusion is reached. First, I suppose it can be said that there is no such thing as a "purely" pistillate strawberry—at any rate those leading varieties that are called pistillate are not purely such, but contain some stamens and apparently enough to fertilize their own pistils. Then the difficulties that lie in the way of having the pollen from one blossom transferred to another that is one, two or five yards away, are so great that the claim that it has been done cannot be easily credited. The crossing of plants of all kinds in this way is much over-rated. This statement should be emphasized—this cross-fertilization is not at all what it is generally supposed to be. There is one plant that is an exception—Indian corn, and this is always cited. But this is wrongfully done, for it is an exception among plants. Its pollen is very abundant and it is placed high where the wind can waft it far and near. Can another plant be found that compares with this in these respects? Vine crops are somewhat readily "mixed," but I have known watermelons grown in proximity without "mixing". You will find beans, peas and other vegetable seeds that have been grown side by side for a score of years, yet they are saved by the housewife in purity. Now all these are capable of being crossed, but, as a fact, seldom are and this is because of the difficulty of depositing pollen of one flower on another some feet or yards away. This difficulty is as great in case of the strawberry as in case of most other plants, lying as it does low down with the blossoms obstructed by leaves, so that the wind cannot readily carry the pollen to them. I have failed to see bees or insects in sufficient numbers to accomplish it. Here we have been talking of fertilization as it may occur so as to affect the production of seeds, and it follows that if the difficulties are great in this respect they are equally great as regards the fruit.

But, supposing the seeds have been affected, it does not follow that the fruit has been. If it is a common law to affect the fruit it would be observable in other fruits as well—it would be observable to every one—and it is not. Such things have been reported, it is true; but, if they were facts—which is doubtful—it is also true that they were exceptional cases, representing not one, perhaps, in 10,000 instances. Now, we are required to believe, not only that such crossing may occur one time in 1,000, but that every one of the 500 blossoms on a square yard shall have the due proportion of foreign pollen deposited on it, each one thereby forming a berry—a feat of Nature so remarkable that I cannot credit it.

A CANADIAN ON "PROTECTION."

T. S., PELEE ISLAND, CANADA.—In discussing the question of protection a friend in the R. N.-Y. of September 7, wants the United States potato-growers protected from the foreign "pauper-labor"-grown potatoes of Canada, by an increase of the tariff upon them so as to exclude them from the markets of the States. We "Kanucks" spurn with indignation the imputation that our potatoes are grown by "pauper labor." The potato and other agricultural products of Canada are grown by the labor of the actual owners of the soil to a greater extent, perhaps, than in any other country in the world. If we can raise cheaper and better products of the soil than can be raised in the States, and compete with the latter in their own markets, after being made to pay a tax of 15 cents a bushel upon potatoes, it must be because our soil and climate are better adapted to their growth, or because our farmers are more industrious, economical and self-sacrificing than the same class in the States—and both these reasons are no doubt true.

The people and the press of the States are constantly boasting of their wealth and the poverty of Canada, and it does seem ridiculous that they should be afraid of the competition of Canada in anything and wish to put up the bar of the tariff to keep Canadian products out of their markets. Why should such a great country, with its vast area and variety of soil and climate, its immense thrifty population, with their splendid equipment of improved agricultural implements, its numerous markets and great facilities for transportation, and its thousands of imported foreign laborers—yes, *foreign, pauper laborers*—be afraid of the competition of the poor Canadians in the products of their soil and frigid climate? While they thus keep the poor Canadians out of a convenient market for their surplus potatoes, barley, etc., they also increase the price of the necessaries of life to their own poor consumers.

Another friend tells us in the R. N.-Y. about dining at a hotel where oranges and bananas were on the table to the exclusion of "blueberries" that were growing plentifully upon the hills about, and he forthwith wants bananas taxed to raise the price of blueberries so that they would be worth gathering, and he would thus compel people to eat blueberries which they do not want, instead of bananas which they do want. The advocates of a high tariff upon foreign fruits not only want to deprive the consumers of their choice of the kinds of fruit they like unless they pay a bonus to the "blueberry" and strawberry raisers; but they also wish to cut the poor natives of the tropics off from a market for their fruit, and to keep them in still greater poverty and ignorance in order that they themselves may make greater profits and go on adding to the comforts and luxuries which they now have. Every one wants his particular product protected from competition so that he may increase the price to the consumer and make greater profits. This is a call upon the government to keep up the price of the products of the more well-to-do and comparatively small class, the producers, at the expense of more numerous and poorer class, the consumers.

R. N.-Y. Isn't a protective tariff in force in the Dominion as well as in the Union? Isn't the tax levied by Canada on goods imported from the United States about as heavy as that levied here on imported Canadian goods? There are honest advocates of free trade or reciprocity among the minority in both countries, however, and doubtless our friend objects as strongly to the Canadian as he does to the "American" tariff.

CHICAGO DRESSED BEEF.

J. W. N., STOWE, VERMONT.—The raising and fattening of cattle for beef is a thing of the past in this section. A few years ago the cattle-buyers or drovers came around as regularly as the seasons, bringing thousands of dollars into this State, and taking away car-load after car-load of fat cattle. Others would come and buy up store cattle, calves, yearlings, and old or farrow cows. These were taken to New Hampshire and Massachusetts and fattened. But this is all gone by. It is almost impossible to sell any kind of neat stock excepting what little is used by the country butchers for which the farmers get three to 3¼ cents per pound live weight. A few head of fat cattle go from this State to Boston nearly every week; but probably where one car-load of fat cattle is carried out of the State an equivalent of three car-loads, in the form of dressed beef, is brought in. The dressed beef goes into the large towns; small places do not receive it. Consequently the business of the local butchers in small towns is not affected to any great extent. The result is that farmers are forced into dairying, and this is one of the causes of the over-production of butter. The farmer must raise crops. The only crops we can market are potatoes, beans and a little hay. Hence we must feed what we raise to cattle. But the beef industry being destroyed and butter being so low, a large part of the farmers' income is cut off. It is not possible for men engaged in dairying to turn to sheep-raising without great loss, and few can make a profitable business raising horses

To regulate the matter fairly, the railroads should be made to charge more equitable rates. A carcass of dressed beef, I am told, can be sent from Chicago to Boston for one dollar, while it costs eight dollars to ship a yoke of oxen alive from Northern Vermont to the same city. But this is only a step. The dressed-beef trade needs regulating wherever its baleful influences extend, and it is only one of many similar evils. The future prosperity of agriculture in this country seems to demand of the farmers three things: first, improved methods of farming; second, business methods in buying and selling; third, wise use of political power. If things go on as they have been going for two or three years back it is only a question of time when the tillers of the soil will be far on the way towards serfdom. It is the old story of greed and selfishness, of the few growing richer and the many poorer. But the farmers of this country are possessed of great intelligence, vast political power, and a large amount of wealth. The pressure that trusts, middlemen, and speculators of all kinds are putting upon them is forcing them to use their power for self-protection. They are learning the value of combination and co-operation, and the power they can wield in the government. It is along these lines that the regulation of the Chicago dressed-beef trade and all other systems of organized legal robbery must proceed. There is a wise and a right way to meet these evils, and this way will no doubt be found.

A PREVENTIVE FOR THE CAULIFLOWER MAGGOT.

H. A. M., SKAGIT COUNTY, WASHINGTON.—I think I have found a preventive for the cauliflower maggot. I have tried everything that I have seen recommended for killing the pest and have never found anything that would kill it without injuring the plants to a greater or less extent. The only sure way with us has been to get down on our knees and dig the rascals out and kill them. I read in the RURAL last year that the Editor had used sulphur in the trenches to keep the wire-worms from causing scab in potatoes in the great wager trial. I thought that if it would repel the wire worm, it might have a similar repulsive effect on the maggot fly. The experiment was worth trying anyway. On May 10, I set 10 rows of cauliflowers, putting a little over 100 in a row. This was when the fly was doing its very worst. After taking the plants from the cold-frame where they were grown, we puddled them in the usual way but added half a pound of sulphur to the puddle. Then after the plants had been set, a boy went through each row with an insect-powder gun charged with sulphur, and blew half a teaspoonful around each plant. The two outside rows, one on each side, were planted without sulphur in the puddle or on the surface around the plants. The result was that these two rows were nearly destroyed; while not a plant of the eight that had been treated with sulphur was killed by the maggots. In fact, I never found a single fly or egg around the plants. I have so much faith in the sulphur preventive that I have ordered 25 pounds and intend to use it on everything the fly works upon—onions, radishes, turnips, cabbages and cauliflowers. I hope some of the readers of the RURAL will give it a trial next season and report. The damage done by this maggot pest is becoming so serious that if we can't find something to head it off we shall certainly have to quit raising cabbages and cauliflowers in this part of the country, for the pests did just as much injury for me on a new piece of ground that had never before been cultivated as they did on old ground that had been in cauliflowers for two years.

A BIT OF EXPERIENCE.

MRS. C. M. G., LA GRANGE, IND.—In planting my contest plot, the first two rows were planted with freshly cut seed on the evening of May 1. Not being able to complete the planting the next day, the basket containing the seed was allowed to stand uncovered in the hot sun and drying wind until noon on the third, when on going to finish the planting, the seed-pieces were found to be very much wilted and dry. Some of the worst were thrown away and the remainder were planted, leaving 1½ row, for which fresh seed was cut. The first, second, half of the tenth and the eleventh rows soon came up, looking strong and healthy; while the third, fourth, fifth, sixth, seventh, eighth, ninth and part of the tenth rows which were planted with the wilted seed were fully a week later in coming up and fully one-half never came up at all. During a rainy spell when the plants were about a foot high, the missing hills were filled in by digging down and taking off sprouts from the good hills and setting them, two to three in a hill, about all the good hills in the plot having from one to three sprouts taken from them. All these grew and seemed to do well, but were of course away behind the others in growth. When dug, the two rows planted before the seed became wilted were weighed separately and found to average 81 pounds to the row; while the average weight per row of the remaining nine rows, including the eleventh and half of the tenth which were also planted with freshly-cut seed, was a fraction less than 64 pounds, so I concluded that it does not pay to expose seed to sun and wind.

THE WEATHER SAGE OF NEW JERSEY PROGNOSTICATES.

A. J. DE VOE., HACKENSACK, N. J.—In reading over the different articles furnished by correspondents of the RURAL NEW-YORKER on various subjects regarding their crops, I noticed one on potatoes, and the writer closes with this remark; "This nearly total failure is attributed, in great part, to the fact that a moist plot was selected in anticipation of a dry season. Last spring it was the general impression that, owing to our wet spring, we would have a dry summer, and a great deal of labor and seed was thrown away for lack of knowledge regarding the future state of the weather." This is not only true in regard to potatoes, but with regard to many other crops, and now that summer is past, many are predicting a dry fall, and an open winter; but the rains will continue to fall, and winter will set in very early, and if some of our farmers do not hurry, their potatoes will be snowed under. There is no class of people who are so directly interested in the weather as the farmers. And they ought to be willing to pay for information regarding the future state of the weather, and then turn the information to practical account by planting their crops in such a way that they would harmonize with the weather. The weather is controlled by natural laws, and when men understand these laws they will know just what sort of weather to look for.

SOAKING WHEELS IN OIL.

F. GRUNDY, CHRISTIAN COUNTY, ILL.—The plan of soaking the rims of wagon wheels in linseed oil once a year is a good one. It should be done during a dry spell, when the wood is perfectly dry. The wheels are suspended over a galvanized iron tank containing the oil, and slowly turned a few times every 15 or 20 minutes. They should be soaked four or five hours to do a good job. It may be done in connection with such other work as will permit one to give a moment's attention to the wheels as needed. Some men think that the oil should be kept boiling-hot, but that seems wholly unnecessary. The wheels will soon take in all they will contain if the oil is hot to start with. They should be placed under shelter to dry a few days before they are used. It is a waste of time and money to *paint* the rims of wagon wheels used in this country, because the mud, snow and slush take the paint off again in a very short time, but a good soaking in oil is really beneficial and pays.

SOUTHERN EGG RATIONS.

C. C. W., GRAND BAY, ALA.—Regarding the practice of feeding wheat to poultry; this is not a wheat-growing section and consequently wheat is never used as poultry food; in fact, very little attention is paid to feeding poultry in any way except it may be for two or three months in winter, and then the feed is mostly corn. I have found oats to be much better than corn for egg-production in this warm climate, except in winter; then I use both corn and oats. Have any of the "experts" ever tried rice, in the rough or unhulled, for this purpose? I have never heard of any comparative tests with rice; but I have often heard farmers say that rice will make hens lay better than anything else; but as it is generally worth 90 cents to $1 per bushel very little is fed out to poultry; all they get is from the fields, and at thrashing time. With the present modes of preserving eggs for winter months, in seasons of plenty,

fail to see how it will pay to use expensive feeds for egg-production in the winter.

ANOTHER TELL-TALE ACCOUNT.

C. N. D., SOUTH WESTMINSTER, MASS.—The "Tell-Tale Account" of J. Bounds, in a late RURAL, reminds me of a like account left by a revered ancestor, which reveals the customs of the New England farmers 100 years ago. No wonder they had a "hard struggle" I inclose a copy.

FEBRUARY—1787.

—— Dr.	£.	s.	d.
For 2 qts. rum and ¼ of a mug flip	2		0
For a gallon of rum	3		0
For 2 qts. E. I. 1 qt. W. I. rum	2		10
For 2 qts. rum, ½ a mug flip	1		11
For ½ a mug of flip			4
For 2 mugs of tod			6
For 10 oz. loaf sugar			7
For fish			10
For a butter of tod			3

J. H. G., QUEENS COUNTY, N. Y.—H. G. L., of Charlton, Mass. page 644 should not let his angry passions rise so hastily. The Keiffer Pear as grown in many localities, is anything else but a "little insignificant hide-bound thing." He should see it as raised by William Parry, J. S. Collins and other new Jersey fruit-growers. It is, with them, one of the largest, handsomest and most prolific, and therefore the most profitable of market pears. A good orchard of Keiffer Pears will bring in more money, more clear profit, than an orchard of twice the size planted with any other variety. A Keiffer raised in a section where the sun shines most of the time, is a beautiful fruit, having excellent cooking qualities; and when properly ripened, it is a good eating pear. If H. G. L., will visit Mt. Holly (New Jersey) Fair, he will learn some things worth knowing about the Keiffer and other pears.

G. W. H., READING, PA.—In the RURAL of September 28, Mr. Green's notes on Montana are correct. On September 9th I reached home from a trip to California, Oregon and Washington, returning by way of the Northern Pacific Railroad. Neither is all gold that glitters in Washington, and especially as regards the climate of Puget Sound and other places. I have also been to Los Angeles and San Diego in Southern California where one can see what excitement in land-booming has done—how the human mind can be led away by specious misrepresentations. Three years ago I went South and this year I went West and, all the merits and demerits of both sections summed up, I think I would prefer the South for my future home.

J. E. P., WADING RIVER, N. Y.— I notice, in a back RURAL, a request that farmers should give their experience in breeding from "sore" mares purchased in towns and cities or taken to pasture until they have become sound. I have had considerable experience with "sore" mares for breeding purposes, and only once out of many times have I succeeded in raising a colt, and that was a small and deformed one. Farmers intending to buy "sore" mares for breeding purposes had better save their money.

C. F. E., EASTON, MARYLAND.—My experience is that stable manure damages a potato crop in any season and ruins it in a wet season when rot prevails. The more manure, the worse the disease. A high-grade fertilizer rich in potash, and plenty of it, will give fine, smooth potatoes in abundance two years out of three. Stable manure will do it rarely if ever.

What Others Say

THE MONTANA BOOM.

FRIENDLY AND VICIOUS COMMENTS AND CRITICISMS OF THE R. N.-Y.'S OPPOSITION TO THE BOOMING SCHEME AS CONDUCTED.

THE NEW ENGLAND FARMER of a late date has the following:

"Some Western agricultural journals are advertising Montana, editorially and otherwise, and the RURAL NEW-YORKER thinks they are doing an unfair thing by their readers in encouraging persons to leave safe homes for the hardships and uncertainties of pioneer life. The RURAL claims to know nothing of that far Western State, having declined an invitation to join the editorial party that visited it last year. The agricultural editor of the Farmer did make the trip; and though he did not care to join with some of the other editors in investments there and would not urge New England boys and girls to exchange a good situation and agreeable neighbors for the wild and lonely life of an unbroken prairie, yet we cannot blame Western editors for the course they have taken. They believe in the West as thoroughly and as fully as the RURAL and the New England Farmer believe in the East.

Mr Orange Judd was formerly an Eastern man, but he is now a Western man and expects his children and his children's children will choose that section for their permanent home. Such persons are anxious to see their country growing up and improving, just as Eastern people who intend to remain East desire to keep population and wealth in a healthy state of growth here. These Western editors and railroad men are no more selfish or unscrupulous than are the same classes here in the East. They believe in the West and are doing their best to bring it up to their ideal, and that ideal is not a low one either. We prefer New England and are doing what we can for it."

The Editor of our friendly contemporary unwittingly misrepresents the R. N.-Y's. views in regard to Montana and the West in general, while it does not fairly set forth its objections to the method employed in advertising the Montana lands which are offered for sale. The R. N.-Y., as a journal, is just as much interested in the West as in the East; in the South as in the North. It *"believes" in the West as thoroughly as it believes in the East.* It is published for the entire country and not for any section. It is not the booming of Montana lands that the R. N.-Y. objects to. It is in favor of booming them for all they are worth. It is to the *manner* of booming them that objection is made. If these lands are owned by the editors of certain farm papers, the readers of those papers should *know it*, that they may accept with due caution the advice so freely and forcibly set before them. With the exception of the Farm Journal, none of them have done this. Mr. Atkinson in the issue of his paper dated July 1889, said:

"The Farm Journal is personally and pecuniarily interested in the success of this town (Chinook). We have invested some money there because we thought the investment might prove remunerative..... When therefore, we commend Chinook, among other places to our readers, they will please make allowance for the fact that we may be influenced," etc., etc. This is the only acknowledgment of the kind we have seen. It is very well as far as it goes. But to be just and in accordance with the impartial and honorable spirit which should guide every editor in his editorial utterances, the fact of his ownership in such lands should be *kept before* his readers with *every* advertisement or commendation of the lands for sale that appears, so that those who read the one shall read the other as well. Nearly all of the papers whose editors are booming Montana are just about as far from Chinook as they are from Boston or New York, and might reasonably be expected to help the interests of the one section as well as those of the other. The simple fact is they have put their heads together to make a heap of money by praising without stint certain Montana lands, while the readers are left to assume that this praise is as disinterested as that given to any thoroughly praiseworthy project or enterprise.

"COME WEST, YOUNG MAN."

THIS is the title of a vicious editorial in the Orange Judd Farmer of September 22. It contains more falsehoods and those of a meaner character than any other article we have ever read of the same length. Here are its important parts:

"If the verdant young man of the RURAL NEW-YORKER would arouse himself enough to leave his New Jersey acre, and 'sand lot' on Long Island, yclept an 'Experimental Farm,' and come West a few weeks or even days to look over the country beyond the Mississippi and Missouri Rivers, to say nothing of the grand country east of them, it would be a wonderful eye-opener and mind-opener, and he would go back a much wiser man. He would learn that there is more good farming land even west of these rivers, between Canada and Mexico, land superior to New York, New Jersey, Long Island and New England, than he ever dreamed of in his cooped-up strip of worn-out Atlantic sand; that there is, right on the sides of and among the Rocky Mountains, vastly more of the best land in America than can be found in the whole States of New York, Pennsylvania, New Jersey and Long Island, (*sic*). He would no longer think or talk of the 'wild and wooly West,' or depend upon discharged employees of Western agricultural papers for false information, or charge Western editors with publishing 'untruths' about the value of the newer regions. He would have a higher regard for those agricultural editors of the West, and Eastern ones too, who, after having been enterprising enough to go and *see* the West, advise investing in Western lands rather than in the worn-out soil of New Jersey and the sand banks of Long Island.

It was the cream of the enterprising men of the East who came West—those who had spirit and vigor enough to strike out into new fields and develop the country—to 'leave their former safe homes and endure the hardships and uncertainties of pioneer life.' The non-progressive, slow-coach, ease-loving residue stayed behind and are trying to amuse themselves with carping at their more enterprising fellows.

Let the 'RURAL' man get out of his glass house, suspend his seed, his potato and other gift enterprises for a month, and come West. What he receives for advertising quack medicines, corn salves, pills, etc., will meet all expenses of a trip to the Pacific, to learn something of the country. He would find whether or not there are 'safe homes' and desirable ones, too. Better come and *see* the West, Young Man!"

The man who is responsible for the above conglomeration of sneaking falsehoods is one of the leading spirits of the Chinook-Montana boom syndicate. We heartily wish Montana all the prosperity to which its climate, soil and resources may entitle it. We merely feel called upon to warn people not to accept the advice or representations of a-half dozen editors who are unscrupulous enough to seek to fill their pockets at the cost of editorial integrity and disinterestedness. Let them visit Montana before relinquishing their present homes, wherever they may be, and investigate the matter for themselves or, if this be impracticable, let them remain just where they are.

BOILED DOWN AND SEASONED.

YES, as Mr. Crosby stated in the R. N.-Y., last week, it will be found in all kinds of stock-growing that some well-established axioms have been allowed to stand on very slight foundations.....

IF Mr. Alfred Rose is an honest man, we wonder how he feels now, having stated positively, something less or more than a hundred times, that the R. N.-Y. appropriated one of his varieties of potatoes and called it R. N.-Y. No.2. An apology dear Mr. R se, is quite in order.....

T. B. TERRY says, in the Ohio Farmer, that potatoes must be kept in the dark. T is is the only proper way. He says the whitest, choicest potatoes will be injured in a short time in any cellar where one can see to walk around. They will look yellowish when cooked and their fine quality is gone. If you cannot make one room of your cellar absolutely dark, see that your home supply is kept in tight boxes or barrels and well covered.....

PROF. A. J. COOK found tobacco water effective against the Flea-beetle on potato vines. He used one pound of tobacco dust to two gallons of hot water.....

ABSTRACTS.

——GEORGE HOUGHTON IN THE CHRISTIAN UNION: "The man who is most likely to get his salary raised is the one who already makes his present salary more than just enough. He's worth more for that very reason. He's forging ahead."

——"Mere cutting down expenses doesn't mean economy. It may mean extravagance of the worst sort."

——"Yes, I'm a little old-fashioned in that respect. I can't help thinking that every trade should be a fair exchange of values. Otherwise it's a trick instead of a trade."

——"The sons of Adam have always, so far as I know, wanted the world to take them at their own valuation, and pay them every Saturday night; according to my experience and observation, the world has always declined to do that."

——"The only way to make a live paper is to inspire it with a live issue of some sort—or any sort. That's its breath of life."

——"They say the patient waiter is no loser. That depends on whether he has anything in his apple-cart to lose or gain, or whether he wears a white apron in a restaurant. It also depends on whether it is a sit-down or stand up waiting. Phillips as a sit-down waiter is a perfect pryramid of Cheops, but gray hair and nicotine are all he seems to have accumulated."

——"You haven't time? Well, just sit down and fold your hands for an hour or two, until you have!"

——"'I care not who makes the incubators of the country,' cackled the hen, 'so long as I furnish the raw material.'"

——MUNSEY'S WEEKLY: "St. Peter: 'Havn't I heard your name before?'

Western Boomer: 'Of course you have! Everybody has heard of the founder of Hustlerville, Dakota!'

St. Peter, 'You can come in, Mr. Boomer, but you mustn't write any pamphlets about this place. You're liable to make statements that the attractions won't warrant.'"

——WHITTIER: "In months of sun, so live that months of rain shall still be happy."

——"WHEN a man's head is turned he never looks to the right."

——CECIL: "The shortest way to do many things is to do only one thing at once."

——CENTURY: "It is a maxim with physicians that the incurable and the easily relievable maladies are those which have most remedies assigned to them."

——DR. COLLIER IN THE HUSBANDMAN: "What would our farmers think to pay five cents a pound for nails when the same brand may be bought of another tradesman for three cents; or 12 cents a pound for sugar when another grocer will sell him the same for seven cents, and yet that is just what they are doing in the purchase of commercial fertilizers."

——NEW YORK HERALD: "It has been suggested that one day in the year be set apart for the killing of sparrows. It might be well to take another for sparrers."

——NOT A FAVORITE DISH.—PARISHIONER (to old clergyman with a bundle of old sermons): "What ye got there, Dominie?"

O. C.: "Preserved tongue."—*Binghamton Republican.*

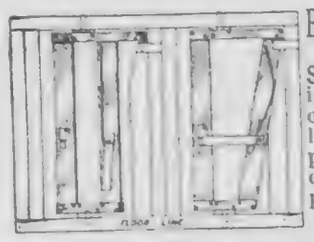
——IT WAS FUNNY.—Burglar: "What are you laughing at, you fool? Do you see this gun?"

Awakened farmer: "I was laughing to see you hunt in the dark for the money I can't find in broad daylight."

Miscellaneous Advertising.

Hood's Sarsaparilla 100 Doses One Dollar

All Run Down from the weakening effects of warm weather, by hard work or from a long illness, you should take Hood's Sarsaparilla, which will purify your blood, expel scrofula and all impurities, regulate the liver and other organs, cure headache, give strength and create an appetite. Be sure to get Hood's.



BOON to DAIRYMEN
Perfect Swinging Cow Stanchion. Self-locking by entrance of cow's head. Free delivery at principal points. Send for circular. Mention this paper. **Scott & Locke, Orford, N. H.**

THE
RURAL NEW-YORKER,
(34 PARK ROW, NEW YORK),

A National Journal for Country and Suburban Homes.

Conducted by
ELBERT S. CARMAN.

SATURDAY, OCTOBER 12, 1889.

NOTICE.

THE RURAL NEW-YORKER is invariably discontinued at the end of the term subscribed for. Any copies sent to non-subscribers are sent without charge as specimens merely.

THERE is not one farm about the Rural Grounds, known to the writer, that has produced over half a crop of the later kinds of potatoes. The very early kinds were cut short but yielded more than half a crop. The blight, to use a convenient word, is not only general but universal.

THERE are many quail, woodcock, rabbits and squirrels in the vicinity of the Rural Grounds. The law-abiding farmer will not kill them out of season. The "pot-hunter" kills them at all times, especially just *before* the law is "up." Rarely is he ever convicted. Better have no laws at all than those which are made in the interests of the lawless.

THERE is every prospect for a mild "boom" in drainage all through the districts that have suffered from too much water this season. As we have said before now, many farmers expected a dry season, so that potatoes were planted on naturally damp soils. The result is now an old story. These farmers now generally believe that had these damp spots been well drained the chances for saving the crop would have been much greater. And this season has also demonstrated the folly of placing tiles too far apart. The cases where such spots as we speak of have been too well drained are hardly worth speaking about.

HAY dealers in the city inform us that it is highly probable that a good market for silage could be created if the product could be properly baled or crated. There has been considerable talk about the best way of packing or baling green hay or silage, but no practical demonstration of the success of such business has yet been made. The best that has yet been done is the baling of the stalks and leaves of corn as they come from a husking machine that has recently been perfected. This fodder is said to be in excellent condition for feeding and if it could be steamed it would be almost as good as silage. The R. N.-Y. has held that the ordinary silage as used by most dairymen, cannot be baled or crated successfully. To make a marketable article there must be a special treatment of the silage and so far as the R. N.-Y. has studied the matter, such treatment is best secured in the system devised by Mr. Colcord, which we have frequently described in these columns.

THE R. N.-Y. has frequently read, in English papers, of the value of cabbage as a food for dairy cows. Most American authorities condemn this food because they say it will give an unpleasant flavor to the milk. We have a big crop of cabbage this year with but little sale for it. We decided to try a little feeding experiment. The R. N.-Y.'s milk and butter is sampled by people who are always on the watch for disagreeable tastes and odors. Without saying a word to them, the writer began feeding a big cabbage every night to the family cow. It was cut into six pieces with a hatchet and put in the cow's feed box to be eaten during milking. This feeding has been followed every day since then. The cow is ravenously fond of cabbage, the flow of milk has increased, and the "folks in the house" have been praising the quality of our milk and butter. Possibly one can get about as much weight of green food from an acre of cabbage as from an acre of corn fodder. Of course, there may be ways of feeding cabbage that will injure the milk, but they have not been found in our trials. It may also be stated that we have fed cabbages to two horses with excellent results. The horses are very fond of them, and there has been no trouble from colic.

THE R. N.-Y. WOMEN'S POTATO CONTEST.

THE reports of those engaged in this contest must be received at this office on or before October 15th.

$10.

THE R. N.-Y. offers a prize of 10 dollars for the best column of "Notes on a Back Number." Contestants may select any number of the R. N.-Y. for 1889. They are to write short notes in approval or criticism of the various topics discussed in that number. The articles must not be over one column in length. The prize is to be given to the column showing the most sense, and in which the greatest number of topics are discussed. It is proposed to publish all the essays in the form of a "Discussion" symposium.

POOR CITY MEN AS FARMERS.

THERE are hundreds of men in New York City, men with families to support, who are positively unable to earn enough money to pay their living expenses. We speak of honest, sober, hard-working and intelligent men, who love their families and are prepared to do their utmost to earn a living. Inability to handle money in the most economical manner possible, lack of ready capital, natural disadvantages that disqualify one from pushing up into the highest rank of service; whatever the reason may be, the fact remains that every large city can show its share of such citizens. What are such men to do? When one of them reaches the point of life when his senses plainly indicate that his powers are beginning to fail, he becomes desperate. The R. N.-Y. has received a letter from such a man which well illustrates one very important side of the question. This man, has come into possession of a little place of 12 acres—four acres cleared—on Long Island. There is a family of seven, old and young, depending on him for support. At his city work he cannot make "both ends meet." Now he asks: "Can I make a living for my family by working my little farm?" He has read some of the books that recite the great fortunes made by florists, gardeners or poultrymen on a few acres. Like many another city man he says: "If they can do that, I can!" So he asks the R. N.-Y. to tell him honestly what his chances are in the country. To obtain a fair answer, we have placed the questions before some of the most practical farmers on Long Island—men who have for years studied the profits and the losses of agriculture on just such land as our questioner owns. Their answers will, as we believe, open the way for one of the most thoughtful discussions that the R. N.-Y. has ever undertaken. Surely the question of properly balancing our city and country population is of the greatest importance.

HOW ABOUT SORGHUM SUGAR?

THERE is nothing in recent agricultural experiments in this country which has given rise to so many confident hopes to be followed by vexatious and often costly disappointments as the numerous attempts at the profitable manufacture of sugar from sorghum. It was only a few years ago when we were assured by the "best authorities" that it could be done on almost every farm on which a good crop of corn could be grown, in most of the States. A multitude of experiments were made; the manufacturers of rollers and evaporators did a fine business; reports of successes came from all sides. Are those rollers and evaporators keeping company with useless churns and other worthless patent devices about the farm buildings now, or have they been sold or bartered as old metal? How is it the successes haven't been repeated? Even where the business was encouraged by State and National bounties it is either dead, dying or languishing. Kept up by State and National support and encouraged by a particularly favorable climate, it is yet "promising" in Kansas. There the "diffusion process," from which so much has been expected, and the patent process which promised so much have been tried together; but Secretary Rusk, who has just returned from an inspection of the mills, declares that he cannot say that the industry is as yet on a profitable basis. Three or four of the chemists who are drawing comfortable salaries are, however, "still hopeful of favorable results;" but the Secretary frankly says that unless improvements are made in the business, he is "very doubtful about the profit of making sugar from sorghum cane." Well, the improvements may be made, or new processes may be discovered, or the price of sugar may go high enough either through the extortion of the Sugar Trust or the withdrawal of European bounties on beet sugar and consequent curtailment of its manufacture, or several other things may happen to make sorghum-sugar making a profitable business; but who can yet see any indications of so desirable an event?

AN AMERICAN DAIRY CONTEST.

FOR a number of years the R. N.-Y. has urged the managers of dairy exhibitions to adopt the English plan of "working dairies." These "dairies" are simply public competitions in which butter-makers, working under uniform conditions as regards cream and tools, strive to produce the best samples of butter. We expected that the managers of the Wisconsin farmers' institutes would start the matter in this country, but the managers of the Bay State Fair are first to organize and push such a contest. At the fair to be held in Boston next week there will be three such competitions: 1, between butter-makers using cream raised by cold, deep setting; 2, between those using cream from a separator; 3, a sweepstakes prize for the winners of the first and second premiums in the first two classes. In England these contests are designed for women alone; at the Bay State Fair both men and women will compete. The following points regarding the manipulation of the cream are to be observed by the judges:

Straining cream into churn	4
Intelligent use of the thermometer	6
Ventilation of churn	8
Speed and management of churn	6
Judgment in stopping the churn	20
Time in churning	8
Straining the butter-milk	4
Washing butter in churn	10
Cleanliness in handling	8
Using the butter-worker	8
Making up butter, or packing	8
Grain or texture of butter	10
	100

Each candidate is required to pay an entrance fee of $5, which will be refunded on the completion of the work. In connection with the contests, short talks on dairy matters will be given by some of the best dairymen in New England. We shall watch the result of these contests with considerable interest. It will be noticed in the rules that 52 out of 100 points are given to the operations that affect the texture or granulation of the butter. This shows how very important this matter is—it is the operation most generally neglected by poor dairy people. The R. N.-Y. wishes to say in this connection that a great many people seem to believe that it is impossible to make sticky or salvy butter in a churn that contains no floats or paddles. This is a great mistake. Over-churning in any of the revolving or swinging churns will surely produce a sticky, pasty mass of butter.

TELLING RESULTS OF THE R. N.-Y'S. FERTILIZER EXPERIMENTS.

THE R. N.-Y. considers itself fortunate in having quite an area of very poor soil on which to experiment with fertilizers. It is because the land is already fertile or at least well provided with one or more of the food constituents supplied by so-called "complete" fertilizers, that the experiments made by farmers for a season or so prove little or nothing or are altogether contradictory. For about 14 years the R. N.-Y. has made trials with different quantities of fertilizers to find out how large an amount could be *profitably* used. Those made at the R. N.-Y. farm on Long Island, which is in a high condition of fertility in every part, gave no further information than that 200 pounds per acre would give as large a crop as when 2,000 pounds were used. In order to get the desired information it would be necessary to carry on the same trials for many years, the same as Dr. Lawes has done at Rothamsted.

Not so on the impoverished soil of the RURAL's experiment plots in New Jersey. Here the answers come at once, and the testimony is direct and convincing. The soil wants nitrogen, potash and phosphoric acid and it *must have* them or paying crops cannot be raised. We have shown this as the results of six seasons of the same trials. And it has been further shown that the potato crop will be profitably increased by the application of as high as 1,700 pounds of high-grade potato fertilizer to the acre, while in some cases the increase has paid the additional cost of 2,200 pounds.

Our report for the past season is not quite ready. But two plots have been harvested and weighed. Here is the result in round numbers per acre:

FIRST SERIES.

Plot 1.		Natural soil	161	bush.
" 2.	440	lbs. fertilizers	190	"
" 3.	880	" "	212	"
" 4.	1320	" "	278	"
" 5.	1760	" "	330	"
" 6.	2200	" "	308	"

SECOND SERIES.

Plot 7.		Natural soil	154	bush.
" 8.	440	lbs. fertilizer	187	"
" 9.	880	" "	216	"
" 10.	1320	" "	246	"
" 11.	1760	" "	297	"
" 12.	2200	" "	330	"

It will be seen that, with one exception, the yield increases as the fertilizer increases. In the first series, 2,200 pounds of fertilizer give 22 bushels less than 1,760 pounds of fertilizer; while, in the second series, the larger amount gives 22 bushels increase.

The above tables show, in a general way, just what is shown by all previous experiments upon this or similarly poor soil in the same or a neighboring field.

BREVITIES.

"DOMESTIC FRUITS AT AUCTION." Read what is said on this subject. See page 685.

A HEN that will not scratch and a cow that is not greedy for her food are the animals that are better dead than alive.

POTATO diggers like the R. N.-Y. No. 2 Potato because the tubers are "all in a bunch." A skillful man can throw all the tubers out at one forking.

AT Suffolk County Fair, Riverhead, L. I. a first premium was awarded to E. E. Mosier, of Riverhead, for the Rural No. 2 Potato. About a dozen specimens were shown. They were remarkably uniform in size and shape.

THE RURAL NEW-YORKER is much improved in appearance with its new dress and changed "make-up." I am pleased to note this evidence of deserved prosperity. The R. N.-Y. stands in the front rank of agricultural journals of the world.

Ionia County, Michigan. C. F. HUNTSMAN.

WE can not find space for all the reports kindly sent to us of the R. N.-Y. No. 2. Of one thing our readers may feel assured: we shall print the bad as well as the good reports without any discrimination. The R. N.-Y. is interested only in showing up this potato *as it is*. Up to this time, our opinion of it is that it is the most valuable late potato (where it succeeds) known.

THE picture of Mr. Terry's tools has excited a good deal of interest. We hope to follow it with pictures of the tools used on a Massachusetts farm, and also the tools used on farms in Alabama, Dakota and Colorado. A Western lady suggests that we ought to show the tools used by Mrs. Terry in her kitchen. This is a good suggestion, and we hope to be able to carry it out.

I FIRST became acquainted with the RURAL NEW-YORKER by sending my address for a five weeks' trial trip. At that time I was taking three farm, one political and two religious papers. As my time expired, I dropped two of the farm papers and substituted the RURAL in their place, and feel much pleased with the change. I receive the bulletins from the experiment stations of N. Y., and would rather pay for them than not receive them, but I like the RURAL the best. ALBERT ROBINSON.

Erie County, N. Y.

Field Crops.

RURAL POTATO REPORTS.

THE small tuber received from the RURAL was cut to 10 eyes, and planted April 3d, one eye in a hill, one foot apart in the row in a light soil with clay subsoil without fertilizer of any kind. The row was cultivated twice with horse and hoed twice. The crop was dug September 6th, yielding 19 pounds and 14 ounces, of fine, smooth tubers, free from any blemish—64 tubers in all, 57 being of marketable size and seven small. The largest weighed 14 ounces, and the next largest, 12 ounces. The smallest tuber counted as marketable weighs three ounces. J. E.

Keokuk, Iowa.

I HAVE dug my No. 2 Potatoes grown from the one sent me last winter. I did not prize it very highly at that time. It was very small and did not appear to be of much value; but it has proven itself very different. I planted it about May 6. with little hope of obtaining anything; but, to my surprise, I had 9½ pounds of tubers, one weighing one pound, and another weighing nine ounces. There were 35 in all. and 32 of them were marketable. The original potato I cut in six pieces, with one eye on each. One was cut off by a worm and one hill was destroyed by moles, so that I had a pretty fair yield after all. I think at the rate that little fellow yielded my big one-pounder must produce a barrel. J. S. W.

Freehold, N. J.

THE R. N.-Y. Potato No. 2 received last spring was about two-thirds the size of a hen's egg. It was cut into eight one-eye pieces, and planted May 2. The pieces all grew. The hills were three feet apart each way. The soil was heavy clay loam enriched with Stockbridge potato fertilizer at the rate of 1,600 pounds to the acre. On July 25, the vines began to show rust or blight, and by August 5, they were nearly all dead. I dug them August 20; yield 6¾ pounds; the best was one-half pound. All were sound. On an experimental plot of eight varieties, the R. N.-Y. No. 2 gave the smallest yield, but it was the only variety that did not rot more or less. Had not the blight come, the result would, quite likely, have been very different. I. O. E.

Oneida County, N. Y.

I PLANTED the R. N.-Y. No. 2 Potato April 18. There were seven eyes and the pieces were cut to one eye. They were planted in a trench in rotted chips from the woodyard, one foot apart; five grew and were frozen down once and were cultivated twice, once with the garden rake and once with the hoe, and when they were ready to bloom I threw a wheelbarrow load of chips and horse manure around them. The Flea-beetles worked at them whenever the weather would let them; but it was very wet until the second week in August when we got some hot, dry days that finished up both early and late potatoes. I had never before seen so many beetles and they are working on the late vegetables yet. Well, I dug my No. 2 on August 19; the largest stalk yielded three tubers weighing 11 ounces each, making 33 ounces. There were 28 in all, three small ones; in all 19½ pounds. Not one rotted, nor was there a spot on them, and we think they are going to beat the Blush. Potatoes are rotting badly except the Stray Beauty. Is it not strange that all three of the largest No. 2 should grow on one stalk and weigh just alike and all look alike? I cannot make up my mind to cook any of them, for I want them all for seed.

Moore's Hill, Ind. MRS. R. A. C.

Miscellaneous.

HONEY DEW.

Sometimes due to exudations from nectar glands in plants; but far oftener to the action of insects: exudations from plant-lice and from insect-made plant wounds; instances of the operation of different causes.

The term honey dew originated in the belief that at certain times and under certain unknown conditions, a dew as sweet as honey, would collect upon plants during the night, and there are many who still hold to this erroneous idea. The causes that produce the so-called honey dew are many and sometimes there seems to be no explanation for its appearance, unless we accept the old notion as correct, but it will not do to say that it must be dew because we do not see what else it can be; that would be very unscientific. It has been learned that some plants have nectar glands in their leaves, which exude a sweet liquid upon their surfaces, but insects are by far the most common cause of such appearances.

I took my insect net and collecting case a few days ago and started for a little walk in the fields to see what I could catch. After sweeping my net for a short time among the tall grass and weeds along the border of a field, I sat down under a willow tree to examine my catch. The sun was shining brightly and there were no clouds overhead, but as soon as I had seated myself on the grass, I felt what seemed to be drops of rain falling on the backs of my hands. I had had similar experiences before and at once surmised that there were plant-lice on the limbs overhead. A glance among the branches was enough to confirm this opinion, as the lice were present in great numbers on every part of the tree, and everything below was receiving a gentle shower of nectar.

The sweet liquid from the little nectaries or honey tubes on the backs of these insects, sometimes falls in such abundance as to cover everything beneath with a heavy coating of white sugar, as it evaporates. I have a sprig of spruce in my collection, that is so heavily loaded with sugar produced in this manner that the weight of the sugar would be at least three or four times that of the twig after the sugar is removed, and the sugar itself is as sweet as any that you could buy at a confectioner's store.

Some who supposed that the aphides were the only cause of honey dew have found sweet substances upon trees where it was certain that there were no lice that could cause them, and have concluded that after all there is such a thing as a real honey dew. One warm day, last spring, before the buds began to expand, I came across a Bur-Oak that was swarming with a minute black four-winged fly belonging to the order of insects known as Hymenoptera. There were from one or two to a half-dozen or more of these little flies upon every bud that I could see. All were busily at work ovipositing in the embryo leaves, which was done by first inserting a long ovipositor which might be likened to a sting of a honey bee.

A week later I again visited this tree to see if the little flies were still at work puncturing the buds and laying eggs. Instead of finding the flies, I found that all of the buds and the small twigs of the tree appeared as if they had been dipped in something that had covered them with a sticky varnish, which I found, upon tasting, was sweet. This substance was most abundant upon the buds from which it had run down over the twigs and small branches. At this time the leaves were not yet out, and there were no lice to be seen on the tree and, if I had not happened to be present a week before, when the buds were being wounded by the myriad lances of this little gall-fly which is as yet unknown to science, but which I have described in MS under the name Neuroterus verna, I could not have explained the presence of the sweet material. I know of other gall insects that produce sweet exudations from the oaks, and also of a small worm that gnaws into the young growing acorns, causing the same result. It is probable that there are causes still unknown that produce sweet substances on leaves and twigs of trees, but it is not probable that there is such a thing as a real honey dew. C. P. GILLETTE.

CORRESPONDENTS' VIEWS.

FODDER CORN AND OTHER TOPICS.—Following the RURAL'S advice last spring, I bought one bushel of Thoroughbred White Flint Corn. My neighbors laughed at me for paying such a price—$2 per bushel—but the laugh is on my side now, as I have four acres of as fine corn as one could wish, averaging 10 feet in hight. I planted it mainly for the fodder, thinking that if it matured I would come out so much ahead, and although it was planted late—May 30—if we have no severe frosts, I think it will get ripe. It is planted in drills, the rows being four feet apart, and two kernels in a place, 18 inches apart. It was planted with the Evans two-horse corn-planter, planting two rows at a time. This machine I consider the greatest labor-saver I ever saw, and I own, I think, nearly all the machinery that can be used on a farm of 150 acres, excepting a potato planter and digger, which I have not as yet had any use for. [We want a picture of these tools to go with Mr. Terry's group. R. N.-Y.] A man living near here has for a number of years used the following method of handling his corn. After it is cut he allows it to wilt in the field three or four days, according to the weather; then he hauls it to the barn immediately, storing it in the mow as one would hay, except that he uses about a pailful of salt to a load. I saw it last year about two months after it was put in, and it was in prime condition, being apparently as sweet and bright as when put in. He says he has no difficulty about its heating, and as he has done it a number of years, I suppose he is well satisfied with the plan. This year, however, he has a silo. Now what I want to know is this: Can any of our brother farmers or experiment stations give me any more light on the subject? As this is a fact, I do not see that we have need of a silo. When I saw the corn it was stored in a floor bay, and there was no weight or covering whatever on it, and I think there had not been any. I climbed up on top of it and put my arm in as far as I could and pulled out a stalk. I could see no sign of excessive heat; in fact, it was in first-class condition, beating all the silage I have ever seen, being sweet, which is more than I can say for the silage. G. W. S.

Andover, Mass.

R. N.-Y.—We will try to get all the information we can in this matter. We intended to handle our own stalks this fall in much the same way as that employed by your neighbor, but the rains have been so constant and severe that the stalks could not be dried out sufficiently. We feel sure that with careful packing and the use of enough salt, stalks can be packed in the mows before being completely dried and thus make the best of fodder. We hope some of our friends will tell us why such dried stalks cut and steamed are not as good as the ordinary silage!

RAPID MARKETING OF PRODUCE.—That some more rapid and economical method of handling all perishable fruits and vegetables in our large wholesale markets is needed is self-evident. The old methods answered well enough at the time of their first inception, but the world moves, and improvements are the order of the day on every hand. By the present system, fruits and other produce are sent to commission men to be disposed of to the best advantage. Buyers go from one to the other, jewing down the price, and buying, of course, where they can make the best terms. This tends to lower prices. This class of goods has been sold at auction for many years in Europe and other parts of the world, and efforts are being made to introduce this system here. Imported and California fruits have been so handled in New York and some other cities, but not until recently. Arrangements for handling the Florida orange crop have been contemplated, and a meeting was recently held at Vineland, the principal fruit-shipping center of Southern New Jersey, to devise means for selling the fruits and vegetables of that section at auction. The advantages of this system are rapid handling, prompt sales and settlements, competition among the buyers instead of among the sellers, and a clean sweep of everything offered, at some price. It also necessitates a combination of shippers, and the consignment of goods to a limited number of auction rooms. This would make buyers of many who are now simply receivers, and would tend to drive some of them out of business. Very naturally they are opposed to the change, but it is quite likely that the system will have a more extended trial in the near future. I shall watch the outcome with interest.

OBSERVER.

LAW AGAINST "OLEO."—The only way I know of to get pure lard is to buy dry salt side meat or pork and try out the fat. Is there any provision of the oleomargarine law that requires the boarding-house or hotel keepers to inform their patrons whether the so called butter on their tables, *is* butter or oleomargarine or, in other words, is there any law to prevent the hotel-keepers from buying oleomargarine in bulk and furnishing the same to their guests as pure butter? Would such a law be of any benefit to the dairymen? C. C. W.

Grand Bay, Ala.

R. N.-Y. There is such a law in some of the States—in New York among others—but it is badly enforced. The law requires that where "oleo" is used, a notice stating the fact must be conspicuously displayed where the guests can see it. There is no doubt whatever that "oleo" is used in a large number of restaurants and hotels, but we have yet to see a single case in which the required notice is displayed. If the law were properly enforced, it would of course be a benefit to farmers.

WE ARE TOLD that we should seek only such things as are commendable. With this idea in mind when I visited the New Jersey State Fair, I spent most of my time in the cattle sheds and fruit and vegetable tent. The show of cattle was very creditable; indeed it was worthy of a much more appreciative patronage than it received. The fruit and vegetable exhibit was tastefully arranged, and contained many specimens of considerable merit, considering the fact that this is an "off" year for fruit in this State. A very fine display of potatoes was made by one of your old subscribers, Mr. N. W. Pursell of Elizabeth. A basket of the Rural No. 2 attracted much attention. J. H. G.

Woman's Work.

CONDUCTED BY EMILY LOUISE TAPLIN.

CHAT BY THE WAY.

THIS is the season of fall openings in the dry-goods districts, and gorgeous are the shopping streets of New York. Most noticeable among the costly and beautiful fabrics are the brocaded silks, both for trimming and for elaborate gowns. One which suggested itself as an old lady's evening gown was of pale steel-gray satin. Looking as if lightly strewn upon it, were large sprays of maple leaves in darker gray and black. The sprays were about two feet long, the leaves more than natural size and they really looked more like the work of the brush rather than the loom.

Another design, more lovely still, was a white corded silk, strewn with garlands of pink morning-glory and its leaves in natural colors. Another, with ground of cardinal red satin, had golden sumach leaves scattered over it. A black satin was brocaded with bunches of scarlet gladiolus, the spikes being natural size. Yet another black was brocaded with aloe plants, the thick, shiny leaves with a spike of flowers in the center, all in one color, deep golden yellow. The gorgeousness of these fabrics may be imagined. Other lovely brocades showed designs in deeper shades of the ground color; the patterns are almost invariably floral. Among the new silks shown are some of the old fabrics revived, such as taffeta and peau de soie or paduasoy, as our grandmothers called it. A noticeable house dress was of scarlet paduasoy, having a plain accordeon-plaited skirt; the round waist had a short little shoulder cape in accordeon plaits, full sleeves, and a little garnishing in black lace and velvet. Capes reaching to the waist are quite fashionable this autumn for young ladies; in cloth there are the Directoire capes, very close-fitting, consisting of four or five capes, one above the other. Sometimes the edges are finished with braid, but they are noticeable for their simplicity; some beautiful capes are of surah or India silk in accordeon plaits, gathered into a square or pointed yoke, such as have been worn by children, but they are so pretty that their elder sisters now adopt them.

* * *

SUCH hats and bonnets! The little bonnets get smaller, and the big hats larger—probably the milliner's bill, too. There is not a great difference in shape, so far, from last winter; the bonnets are a little rounder in the crown, but narrow towards the front, the trimming being chiefly on the top. Very pretty little bonnets and turbans of chamois leather are seen; a little bonnet with a chamois crown, trimmed with green velvet and green ostrich tips was really charming. A great many birds are seen on hats and bonnets; sometimes one really large bird, or three or four small ones. We hope none of our readers will turn her hat into a mausoleum for departed songsters; it is certainly time this senseless and cruel fashion was abolished. We don't think women are entirely to blame, for they buy these poor little bird corpses thoughtlessly, simply because they see them in the shops, and admire them. But

> "Evil is wrought by want of thought,
> As well as want of heart."

A woman who would shudder at the thought of killing a snake will buy a poor

little dead bird for her winter hat, thereby encouraging the men who slaughter them and put them on the market. Let our sisters of the RURAL—a pretty large constituency—determine that they will have nothing to do with such cruelty, and, following the lead of the Audubon Society, pledge themselves not to wear birds' wings or breasts, excepting only ostrich plumes and feathers obtained from birds legitimately sacrificed for food. Considering how many handsome made feathers are from the denizens of the barn-yard, dyed and made up, this gives a wide range of choice.

* * *

IF there is one thing more bewildering than the millinery and dress goods at the fall openings it is the upholstery. Such curtains and cushions and rugs and drapery! New and highly artistic, (occasionally very ugly too), are the Bagdad portières. They are made of a coarse woolen canvas, and consist of stripes about six inches broad, fastened together with a peculiar stitch something like herring-bone. The joining is done with coarse worsted, the stripes being laid flat, without any seam. Each strip is coarsely embroidered with the worsted, in odd patterns something like cross-stitch. The strips are of different colors, deep blue, Indian red, orange, brown, black and so on. They are really of Persian manufacture, and do certainly look Oriental, but a good many of them are ugly enough for a night-mare. They cost about six or seven dollars a pair. Some very rich-looking portiéres for 15 dollars a pair are of heavy self-colored velours, the same on either side, in shades of blue or terra-cotta. Just above the bottom is a border about two feet deep, formed of drab cord laid in diamond-shaped lattice-work, edged with tassels. A row of tassels finishes the top. These curtains are very much handsomer than the chenille or Turcoman, now so common.

DAILY TRIALS.

B. H. G.

IT is not the successes, the grand achievements that make up the every-day existence in most lives—these are but landmarks along the way, to which we point as rare occurrences—but the little trials and disappointments: these come every day along with the struggle to overcome self—the occasional victory. When we are tired, how trials multiply. There are so many things to be done at the same time, especially in a woman's life. At such times as these, how the impatient words crowd up to our lips, struggling to get out at the little portal we must guard so carefully. It seems on such occasions that the children never wanted so many lunches spread or so many toys hunted up, and that the men might wait until a more convenient season to have their buttons fastened on, or even do it themselves.

Perhaps a great many of our "daily trials" might be escaped, or at least avoided in a great measure, by good management. It may be, in many cases, that we do not make our calculations so as to get our work out of the way for such emergencies. Probably many of us calculate only on time for what must be done, leaving no time for what may come; whereas by a little fore-thought or good management we could get the duties that are sure to come out of the way, and leave room for the unexpected.

I think it is well each day to do as much of the next day's work as we can without over-exerting ourselves. There are a great many duties properly classed with the mornings, that can be done to advantage during the afternoon before, such as washing and preparing vegetables for the dinner; also making the pie or pudding, if it is to be served cold, instead of leaving the work for the hurried morning hours. Of course, this cannot always be done, for many afternoons are filled with unexpected events.

I often find I can sew more easily in the morning. I can run the machine with less fatigue, and by getting my morning work partly done in the afternoon before, I have time to sew in the forenoon, and if there are interruptions—unexpected calls or company to dinner—my sewing can lie by until another time, which my house-work could not do. There are other trials entirely beyond our control—sickness, accidents, uncongenial companionship, etc. In many cases in married life the wife has to assume, along with her other burdens, the care of her husband's parents. Perhaps they were utter strangers to her prior to her wedding day, and she has to bear with all their little fault-findings about her manner of housekeeping, hearing them say many times a-day: "That is not the way so-and-so did." She may have to nurse them through sickness, or endure their constant childish conversation. That, later in life, when the children are grown, and housekeeping has become a habit, would not be so trying, but with one or two babies to look after, to one unaccustomed to the care of these tender plants, sometimes the burden seems more than can be borne, and she is ready to cry like Elijah, as he lay under the Juniper tree, after his long journey: "Now, O Lord, take away my life."

Happy is she! who when the querulous voice is stilled, the coffin-lid closed over the aged, time-worn frame, can look back to what has been, in many cases, unrewarded service, and say: "I have done my best." And yet it is sad that the first years of a woman's married life should be given as a sacrificial offering to strangers, as they too often are.

As fire refines gold, so these trials of our every-day life, if met with the proper spirit, tone and refine the character, strengthening and drawing out whatever is pure and noble in our nature, burning away the dross; and the one who floats along on life's sea, with never a ripple of disappointment to ruffle its surface, has no bulwark of self-control to hide behind; no safe harbor of self-reliance to tarry in while the fierce storms of sorrow or disaster sweep over the soul.

To me there is something beautiful in overcoming trials, in meeting them patiently day by day, in conquering them instead of being vanquished by them; and although I may not possess these rare attributes myself, I admire them in others, whom in my feeble way I would try to emulate.

MOISTURE IN HOUSES.

IT is stated that the sudden changes of the weather recently from cold to warm and damp, observes the Philadelphia Times, has caused thousands of dollars' damage to wall paper and other articles in houses. Of course it has, and it is so simply because many people do not study the plainest common sense principles in airing their houses.

One evening lately people went to bed with a hunt for extra blankets because of the sudden and severe chill in the atmosphere. When they rose in the morning their bedrooms, parlors, dining-rooms, etc., were yet chilly from the cold of the previous day, while the outside atmosphere had suddenly become not only warm, but hot and oppressive with dampness.

Inconsiderate people opened their windows and doors because the weather was warm, forgetting that the excessive moisture in the atmosphere would rush in with the warm air and swiftly deposit itself on the cold walls, furniture, etc., and penetrate wall papers, curtains, bedding, and everything within reach that presented a surface colder than the air that carried it into the house.

Of course the moisture loosened and discolored paper, made curtains as limp as a washrag, made beds damp and musty, and generally spoiled everything that water could spoil; but all could have been avoided by following the plain, common-sense rule of not opening houses suddenly to suddenly changed atmosphere, carrying an excessive quantity of moisture.

A pitcher filled with cold water and placed in a room in summer will "sweat"—at least, that is what it is commonly called. The pitcher does not sweat, because it is not porous and cannot sweat; but the cold water inside of it chills the outer surface, and, as soon as the outer surface of the pitcher becomes cooler than the atmosphere in the room, the moisture of the air will be precipitated upon the pitcher in drops.

This simple illustration should teach all housewives to avoid suddenly opening rooms in a house when the outside atmosphere is warmer than the temperature of the rooms and full of moisture. In all such cases the wall paper, furniture, etc., being cooler than the outside air, will speedily have the moisture of the atmosphere precipitated upon them, and it will require days to restore the house to the dry condition that is essential to health.

There are no arbitrary freaks in the laws which govern the atmosphere surrounding us, and there is nothing abstruse in mastering them. Warm, damp air will ever precipitate its moisture in houses or elsewhere whenever it comes in contact with anything chilled by a cooler atmosphere, and that is the whole story. The only thing to be added is that, when people have thus ignorantly or negligently allowed their houses to become damp, they should light fires and dry them as promptly as possible.

MATRIMONIAL INTERFERENCE.

MRS. S. H. POWELL.

BEFORE railroads were introduced into Vermont, produce was conveyed to market by large teams and merchandise was freighted back to the country by the same conveyances. There were two men near the center of the State, who had for many years monopolized the business, and accumulated a considerable fortune by transporting goods to and from Boston. They had strong, large, covered wagons, and drove six horses each. One of the men was married; the other was a jolly bachelor, who made friends all along the route by his generosity and genial humor. One day they were *en route* for Montpelier, and had just crossed the Connecticut River into the Green Mountain State. It was a very warm day, and late in the afternoon. The men were walking by the side of their teams, which were slowly toiling up a steep hill. Suddenly terrible screams were heard, and cries of "Help! Murder!" issued from a shanty a short distance from the main road. Osgood was behind and called to Kenney to stop.

"Oh, come along!" the latter answered; "it's none of our business," but as the cries continued, the bachelor could not pass on; so seizing his loaded whip, he rushed up the hill into the house where he saw a man beating a poor woman with a heavy club. Her hair was streaming down her back, and her faded dress was torn, the blood streaming down her face. Quick as thought, Osgood raised his heavy whip, and brought the ruffian to the ground. "Quit that you brute!" he exclaimed. The woman caught up the long iron shovel, and started for her rescuer. "Get out of here!" she screamed. "What right have you to interfere between a man and his wife, I'd like to know?" and she plied her shovel vigorously to his back, and followed him as he beat a hasty retreat down the hill. "I'll teach you to come between a man and wife again." Osgood started his horses in a hurry; but he learned a life-long lesson, emphasized by Kenney's jokes—never to interfere in a connubial quarrel again.

TIME TO GO FISHING.

GRANDMOTHER.

THE Bishop of Vermont was, as a boy and young man, very fond of catching trout in the little brooks that meander through his native town. After he was consecrated bishop of the diocese, he was spending a few days in the place of his nativity, and had a great desire once more to indulge in his boyhood's pastime; but, alas! the brooks were mostly dried up, and the fish were getting very scarce. Some one told him that a Mr. White was a lucky fisherman, and knew where to find the trout; so one day he went into his saloon, and told that he was a native of the town, and was very anxious once more to try his luck at fishing, and had been directed to come to him, and ask him if he would kindly either go with him or direct him where he should go, so as to be sure of catching a good string of trout. White thought a moment: "To-day is Friday, I cannot leave to-morrow, anyway, as it is a busy day, but I will go with you Sunday, if you would like." "Thank you," replied the Bishop, "but I have an appointment to preach at Grace Church on Sunday:" Oh, stammered White, "why did you not tell me who you were; but trout do bite Sunday, the best of any day in the whole week." "Perhaps so, but it will not be convenient for me to go then."

"I see, you are after different kind of fish, Sir." The Bishop bowed himself out.

GOLDEN GRAINS.

TIMOTHY TITCOMB, in his "Lessons in Life," says: "I have found moods to be poor tests of character. Having cut through the crusts of a most forbidding mood, produced by bodily derangement, or constant and pressing labor of the brain, I have often found a heart full of all the sweetest, and richest traits of humanity."

IT is the intensification and the dominant influence of moods that are to be guarded against or destroyed.....

THERE is a calm consciousness in every soul, however harshly Nature may have dealt with the body which it inhabits, that it is itself invulnerable—that whatever may be the condition of the body, the soul cannot be injured by physical forms or forces.

THE soil of a social circle is usually open, and whatever falls into it produces after its kind, whether it be good nature or ill nature, purity or impurity, faith or skepticism, love or hate.....

BLESSINGS on the man who sows the seeds of a happy nature and a noble character broad-cast wherever his feet wander, who has a smile alike for joy and sorrow, a tender word always for a child, a compassionate utterance for suffering, courtesy for friends and for strangers, encouragement for the despairing, an open heart for all—love for all—good words for all..... .....

K'EN are the pangs
Advancement often brings. To be secure
Be humble. To be happy be content.
—*Hurdis.*

GOING into a village at night, with the lights gleaming on each side of the street, in some houses they will be in the basement and nowhere else.—Beecher.....

INTIMATE contact with the nature of a good woman, in the relation of marriage, is just as necessary to the completeness of manhood, as the details of an architectural design are to the homely conveniences around which they are made to cluster.—J. G. Holland.....

TO EXPECT a man to be as much of a man without a wife as with one, is just as reasonable as to expect a half-finished house to be as beautiful as a finished one.....

Domestic Economy

CONDUCTED BY MRS. AGNES E. M. CARMAN.

"Make a little fence of trust
Around to-day;
Fill the space with loving work
And therein stay.
Look not through the sheltering bars
Upon to-morrow;
God will help thee bear what comes
Of joy or sorrow."

ABOUT WOMEN.

MISS GRACE HOWARD, eldest daughter of Joe Howard, the well-known newspaper correspondent, is engaged in mission work among the Indians at Crow Creek, Dak. The Indians have named her "the good-hearted woman," because of her many charitable deeds.

* * *

ALICE BARBER, who has done some very clever illustrating for our magazines, has been added to the faculty of the Philadelphia School of Design for Women.

* * *

MRS. ANNIE JENNESS-MILLER will make an extended tour through the New England States this fall in the interest of dress reform—the art of comfortable and artistic dressing.

* * *

The lines we give below were written by Joseph Whitton, Editor of "Table Talk," a Philadelphia publication. The subject was Mrs. Hettie M. Ogle, a heroine of the Conemaugh. When the terrible flood swept down upon the city of Johnstown, she, with her daughter, bravely stuck to her post, thereby saving many lives—though she sacrificed her own. As the shadow of death fell upon her she dashed off her last message which ran as follows:

"Johnstown, Pa., May 31,—3 P. M.
To the Cambria Iron Co., Philadelphia.
We cannot reach your office. Water immense. Washing out Lincoln Bridge. The

Miscellaneous Advertising.

When baby was sick, we gave her Castoria,
When she was a Child, she cried for Castoria,
When she became Miss, she clung to Castoria,
When she had Children, she gave them Castoria

house full; we are on the second floor. Water still coming up and threatening ruin. This is my last message.—Mrs. H. M. Ogle, Manager."

Astride the loosed waters rose the valley's doom.

And there close at her post a woman sat
To wire such words as might forearm the valley
'Gainst its dread doom.

"Fly for your life!" she heard the warning 'mid
The rumble of the coming flood, and answered:
"No, not yet!"

"Fly for your life!" 'Not yet! Not yet! Until
I've wired each station on its guard, my life
Is tied with duty."

"Fly for your life!" "Not yet; one message more,
It is my last, and then—" And then the roar
Of rushing waters —

She lies with those she sought to save Her name—
Her name is History's now, and through the ages
With a reverential tongue 'twill speak·
"Here was a heroine!"

* * *

The Washington Post says "Everything that a woman may do while maintaining her self-respect is "woman's work." If a woman be physically strong, and without other ties or obligations, let her be brakeman on a railroad train, or pilot an ocean steamer, if she will. She may follow any profession or trade. That one woman is making money as a carpenter, and another as a blacksmith, settles the questions of suitability in these occupations. In all her work, however, let her preserve the woman's characteristics. Let her set an example to men in their rough-and-tumble greediness by gentler and more honest business methods. Leave braggadocio, cheating and swindling to men. Let smoothness, courtesy and sincerity characterize the business methods of woman." And we agree with its sentiments. Women can never become men, any more than men can become women; nor do they desire to. They are, however, equal. The woman who is able to do the same work as a man, no matter what, and do it as well, should receive *equal* wages as well as equal respect. A woman who earns her own living need lose nothing of her womanly dignity—may be just as gentle, refined, and lovable as her more fortunate sisters who can stay at home without a care, as regards their support. "Woman's Work" is doing bravely and faithfully whatever falls to her lot to do.

A BUTTER FOUNDATION.

ELLA GUERNSEY.

"LOOKS well, doesn't it?" said our land-lady, as we drove "home," over the country road leading from the village post-office to the Noah's Ark we were so delightfully summering in, "Cherryvale," an old brown homestead, presided over by practical, motherly, energetic Mrs. Page.

"Yes," continued Mrs. Page, "the Darrow house is the sightliest one in these parts, bein' new, an' Kizzy Darrow, the main-spring of the family, is rale tasty 'bout plannin' an' ornamentin' things surroundin' her. Kizzy's gettin' along in years, but she's managed to get things comfortable, an' the Meadow Sweet Dairy in smooth runnin' order, besides buildin' this house last summer, the foundation bein'—butter.

"I s'pose you never heerd before of houses bein' built on a butter foundation?"

"Not a very firm foundation, that," I replied, taking another view of the pretty new cottage, and the comfortable vine-shaded piazzas, shaded by apple and elm trees, and situated on a green hillside.

"It's just this 'firm:' every cent that house cost has been paid for with the butter money earned by Kizzy Darrow. Dan Darrow, a few years ago, with his wife Tabithy, was jest on the eve of givin' up tryin' to make a livin' farmin', though they owned these 100 acres of good land. They didn't prosper in any undertakin', ontil Kizzy, the summer she was 18, began to get noted as a maker of beautiful, solid, sweet butter from an extra good little cow.

One day as the 'chicken peddler,' stopped for dinner when drivin' his produce to market, an' praised the butter wonderfully, sayin': 'Sech butter as that in the city, would bring extra price, an' a lady paid me for butter that was not the equal of this, 50 cents the year 'round. She was terribly afeard o' gittin' oleomargarine, an' willin' to pay extra for real, country butter.'

Kizzy was tickled, as she'd had so little to encourage her, both parents bein' of the hold-back an' discouragin' order, an' then she fell to wonderin' if she couldn't sell butter for a good price. Butter don't bring much in these parts. When the 'chicken peddler' came ag'in Kizzy was all eagerness to get his opinion of the project of buying another good cow, and making butter for the city market. And then she wanted to find out whether he'd help her or not. Tim Cramer thought a bit, then walked to the spring-house, and looked around the place a little, before he passed his opinion, bein' one of these look-before-you-leap fellers.

'I'd advise you to do it,' he said, 'if you're willin' to keep your butter up to the mark. I'm a bit petikeler about engagin' to supply a family with a prime artikel onless I feel purty sure that I can carry it to 'em at the expected time, in good shape. Of course I can help you get your butter sold, an' I'm willin' to do it, if you'll have ready for me good, firm, sweet butter, neat-lookin', an', mind you, I won't carry to a customer white, spongy, sour stuff that'll disgrace you an' me both. No matter if the weather is hot, an' the cream foams, and' the butter's hard to gather, or it's too cold for it to come, 'thout gittin' scalded to death, or whether you feel tired, an' don't want to take as much pains as usual with it, you'll keep all inferior stuff at home. You have a good pasture, and the best spring of cold, runnin' water in all this country, an' you're strong: If you're willin' to work, through all sorts of weather, get that cow. I'll find a market for you.'

Cows were cheaper than usual, and Kizzy bought two, though I, for one, thought the girl had undertaken too much, knowin' she couldn't look for help from her father in payin' for 'em. I was afeared she wasn't countin' the cost of the feed. She'd have to buy bran, shorts, meal and other stuff, as good milkers must be well fed, an' I knew the Darrow crops hadn't harvested very well since I'd known 'em. Harvests are not apt to be abundant if the sowin' an' tendin' hain't looked after at the proper time. I felt it my duty to go over to the Darrow's, an' tell the young, inexperienced girl jest how it was, an' I went, gittin' there jest as the chicken peddler was on his way home one afternoon, from the city. Kizzy was settin' at the big oak dining-table, her curly hair tucked up in a stout crochet hair-net, with a very clean, long-sleeved, high-necked gingham apron over her dress, countin' over some silver coin.

Tim laughed, when he saw me, then asked—'What do you think of our business woman?'

He said there was no trouble in engagin' Kizzy's butter, at 50 cents per pound summer an' winter, cash in hand. A lady who had a fashionable boarding-house was glad to get it. Kizzy held up for me to see a couple of little molds; then Tim said one of the boarders was terribly taken with that butter, an' bein' an old man, had a great deal to say about the clover meadows, an' runnin' spring at home, so he'd gone an' selected two little molds for individual butter plates, one marked with a strawberry leaf; the other with three clover leaves.

He thought it would pay Kizzy to take extra pains in moldin' her butter, as nice-lookin' articles never failed to sell, bein' sure to be chosen when an awkward-lookin' pat, though tastin' as well, would be overlooked. He also said that fine dairies in good workin' order, havin' every conveience to make the very best butter from good milk, sent to market excellent butter, an' a fair article could be sold the greater part of the year for 30 cents per pound; but women at home, if they went about it in the right way, could yet hold their own, but the day was certainly gone by when farmers' daughters or wives, could slap up an uneven ball of poorly salted butter, with blue milk oozin' from it, an' sell it to folks that had learned to judge butter.

Kizzy's black eyes jest flashed an' I saw, as I heerd her plan with Tim how to buy an' feed, an' sell, that they'd gone a leetle mite beyond me, as I'd learned something myself.

Tabithy Darrow waked up a bit, an' began to lend a helpin' hand to Kizzy, while her doting father jest fell in with all the improvements Kizzy suggested.

The summer was a scorchin' one, dryin' up the pasture, causin' an extra amount of dry feed to be bought. There were weeks when Kizzy had real trials an' pull-backs, as milk can, in hot weather, cause butter-makers a sight of extra work, onless they have every help to keep it of the right temperature. As Tim had said there were weeks when it was hard work to get the butter in the proper shape, but she never once failed to have the number of pounds really engaged ready for him, when he came by.

Everybody laughed a little when old Darrow, who'd all his life slouched around, began to straighten up, an' talked so brisk about 'our' dairy, but the Darrow fortune began to improve.

As the years wore on, more cows were bought, Kizzy came to be an extra good judge of a good butter cow. A good farm hand was hired, and the land was cultivated in a style new to the farmers around here. Every inch of it was bearin' somethin' to feed those cows, as Kizzy said she didn't want to buy so much feed for'em.

Kizzy adopted from the Orphan's Home a little boy who seems to think he is in clover, an' looks up to her as if she were his own dear elder sister, an' he's grown to be a real help to her. I'm knowin' to the buildin' of the Darrow house, an' am free to say I think it was laid upon a good foundation, if t'was—butter.

'Whoa. Dobbin! this horse allus wants to go on to the barn, knowin' as well as I do that there's oats an' corn waitin' for him. Here we are at home, an' there's more company.

PRESERVED GINGER.

As you pare the roots of the green ginger throw into cold water. Boil until tender, changing the water three or four times. Make a sirup of water and sugar, a cup of water and a pound of sugar to each pound of ginger. Skim carefully. Wipe the ginger dry and when the sirup is cold drop it in. Let stand over-night. Re-heat the sirup, skim and when cool pour over the ginger. In two days repeat this with the difference of pouring the sirup when hot over the ginger. Cover tightly. May be used in 10 days.

PICKLED PEACHES.

Seven pounds of fruit, four pounds of white sugar, a pint of strong vinegar, cinnamon and cloves. Peel the fruit and cook carefully until tender—they must not go in pieces. Skim out the fruit into bottles, boil and skim the sirup and pour over the fruit. The spice should be tied up in a cloth. Bottle tightly. MRS. J. A. C.

VERY OFTEN

Life has been saved by a bottle of

AYER'S Cherry Pectoral

The best emergency medicine, it should be within reach of every one, young and old.

"Several years ago, on a passage home from California, by water, I contracted so severe a cold that for some days I was confined to my state-room, and a physician on board considered my life in danger. Happening to have a bottle of Ayer's Cherry Pectoral, I used it freely, and my lungs were soon restored to a sound and healthy condition. Since then I have invariably used and recommended this preparation, and always with beneficial results."—J. B. Chandler, Junction, Va.

Prepared by Dr. J. C. Ayer & Co., Lowell, Mass. Price $1. Six bottles, $5. Worth $5 a bottle.

W. R & CO'S IMPROVED BUTTER COLOR

IF YOU REALLY WISH to use the very best Butter Color ever made; one that never turns rancid, always gives a bright, natural color, and will not color the buttermilk, ask for *Wells, Richardson & Co's*, and take no other. Sold everywhere. More of it Used than of all other makes combined. Send for our valuable circulars. WELLS, RICHARDSON & Co., Burlington, Vt.

News of the Week.

HOME NEWS.

SATURDAY, October 5, 1889.

THE Maryland White Lead Company, one of the largest "outsiders," has just been taken in by the National Lead Trust, and so the work of monopolization goes briskly on in spite of all prognostications, "resolutions" and laws to the contrary.....The Mississippi steamer Corona which left New Orleans at 7.30 last Wednesday evening for the Ouachita River, with a full cargo and a large passenger list, exploded her boilers nearly opposite Port Hudson at 11.45, next morning, causing the loss of the steamer and 40 lives. The vessel was worth $20,000 and she sank in a few seconds.....News has been just received that the ocean steamer Earnmoor, bound from Baltimore to Rio Janeiro, foundered in the Gulf on September 5, during that terrible hurricane, which raged on the West Indies several days before it reached our coast. Nineteen of the passengers and crew were lost and seven escaped..... A wealthy company has just been organized to supply New York City with gas fuel made from a combination of anthracite coal and asphaltum under several new patents. Anything to antagonize the coal monopolists would be welcome even at the cost of tearing up the streets for gas mains once more..... E. C. Baker, representing Victoria, B. C. in the Dominion Parliament, has resigned his seat owing to his inability to secure redress for those of his constituents whose vessels have been seized by the United States cruisers in Behring Sea. He was a staunch supporter of Sir John Macdonald; but neither the Premier nor the British Government was willing to risk trouble with the United States to placate the bellicose temper of British Columbia. Of course, Baker will seek a re-election as an indorsement of his course, somewhat on the same principle on which Senators Conkling and Me-Too Platt acted in resigning from the U. S. Senate ages ago.....Of the eight poaching sealers captured and sent to Sitka by the commander of the U. S. revenue cutter Rush, only one—owned by Americans—went there: all the others went to Victoria, where their crews are now mad at the ruin of their enterprise, as the crews get most of their pay from a share in the profits of the cruise. The Rush, on her way home to San Francisco, is expected to touch at Victoria, and the exasperated men threaten to capture and sink her. The militia are under arms to prevent a breach of the peace and a violation of international rights. Judge Sawyer, of the U. S. Circuit Court at San Francisco, has just rendered a decision which covers all the captures made by the Rush as well as all previous captures made by other U. S. vessels under similar conditions. It justifies the seizure and confiscation of all the vessels with their contents. Under this ruling, the escaped vessels may be seized wherever found and sold as the legitimate prizes of the Revenue Service..... In the World's Fair embroglio New York is still confining her efforts to squabbling about the site; but promises to come to an agreement and start a big subscription list next week; Chicago has increased her subscription to $8,000,000 so as to overtop St. Louis; St. Louis, according to immemorial custom, is doing nothing particularly brilliant; but a good deal of quiet work, and Washington is still waiting; but her annex, Baltimore, is doing some lively hustling for her.....Connecticut will vote on a Prohibitory constitutional amendment Monday..... In the elections in the four new States last Wednesday North and South Dakota and Washington, all went Republican and Montana is in doubt; though there's a strong pobability that it has gone Democratic. South Dakota certainly and North Dakota perhaps favor Prohibition; the two others have certainly gone "wet."..... Gen. B. M. Prentiss, who with his entire command, was captured at the Battle of Shiloh, has been appointed post-master at Bethany, Pa. His splendid qualities as a soldier offset his shortcoming in being a Democrat.....A prominent figure in Western politics has just "stepped down and out" in the person of Ex-Governor John A. Martin, of Kansas. Born in Brownsville Pa., March 10, 1839; became local editor of the Brownsville Clipper in 1854; moved to Kansas in 1857. In 1861 was made lieutentant-colonel of the 8th Kansas Regiment, and Provost-Marshal at Leavenworth in 1862; held same office at Nashville, Tenn. in 1863, and then got command of a brigade. In 1864 was made brevet brigadier-general. In 1866 was elected Commander-in-Chief of the G. A. R. in Kansas, and Governor in 1884 and 1886 on the Republican ticket.....The faculty of the University of Pennsylvania favors opening the doors for the co-education of women. The sister is stepping hard on the heels of the brother and will soon be striding abreast of him.....The International American Congress has met at Washington and started to inspect the resources of the country.....Engineer Robillard, of Minneapolis, is the latest to claim the discovery of "perpetual motion"—right after the collapse, too, of Brown-Sequard's "elixir of life."..... Col. Wiley I. Scribner, Recorder of Cook County, Ill., died suddenly on September 28, from rupture of an artery caused by hearty laughter at a newspaper joke—on another fellow.....It appears that the "baby" bonds of Louisiana—bonds which the courts declared illegal and ordered to be destroyed in 1879—were not destroyed as supposed. On the contrary, many, if not all of them, were fraudulently issued while Major E. A. Burke, Director-General of the New Orleans International Exposition, was Comptroller of the State—from 1880 to 1887. The fraud is known to be at least $1,200,000, and may be greater. Interest on many of them has been paid for years. The endowment bonds of the Agricultural and Mechanical College are also involved. Burke, now in England, says that he will shoulder all responsibility, and return at once to set things straight. There's a report that nine indictments have already been found against him; and 16 more are expected..... There's talk of starting a monstrous American brewery syndicate with a capital of $100,000,000 to combat that big British brewery syndicate. After having unloaded his beer works at a splendid profit on John Bull, is brother Jonathan going to fleece him of his expected profits? Or will it not rather be another battle between foreigners on American soil—this time between the Teuton and the Saxon? It will, however, be probably rather hard to get up a syndicate with a capital of $100,000,000, even when the enormous profits on beer are the allurement.....The convention held at Topeka, Kansas, in support of the movement to provide a deep-water harbor on the Gulf Coast to accommodate Western and Southwestern commerce, is of very large size: about 1,000 delegates have assembled. It is estimated that $10,000,000 will be required to provide a suitable harbor. Statistics show that while the sum expended by the Government for public improvement in the States east of the Mississippi from 1789 to 1886 amounts to $11.88 per head, estimating the population in 1886 at 60,000,000, in the States and Territories west of that river the total appropriation has only been $2.83 per capita. The West therefore demands that this discrepancy shall be "evened up" before any further appropriations are made for the East. A large proportion of the money for the East, was paid by the East, however, before any "West" existed; still with its enormous surplus revenue the whole country can afford to be generous for improvements as well as for pensions..... The Colorado Mining Exchange, in its desire to push its silver on the market, is to bring a suit against the Government to test the constitutionality of the law restricting the coinage of silver.....New England has hitherto been the strongest opponent of reciprocity with Canada; but from evidence given the other day at Boston before the Senate Committee investigating the trade relations of the two countries, it would appear that there is now a strong current of public opinion in the other direction. A good deal of forcible evidence was given by prominent representative men in favor of a liberal measure of reciprocity as likely to be quite advantageous to both countries.... A good deal of effort is being made to prove that Daniel Draughbaugh was the real inventor of the telephone. It is said the Bell Telephone monopoly is quietly pushing the case. At the commencement of the original litigation, years ago, the Bell people are said to have secured a majority of the Draughbaugh stock to provide against an adverse decision. The Bell patent expires in 1893, and then scores of rival telephones now barred out by the monopoly, will enter the field. If, however, Draughbaugh should be declared the real inventor, the Court would grant a monopoly to his patent for 17 years, and the Bell people controlling a majority of the stock, would be enabled to continue their extortionate monopoly till 1910.....Joseph Pulitzer of the New York World, has just founded 60 permanent collegiate scholarships for the poor boys of the public schools of this city. Twelve boys who have completed the grammar school course will be selected each year, and to each of them is to be given a scholarship of $250 a year for five years, thus making the cost to the donor, when all the scholarships shall have been assigned, $15,000 a year. Joseph was a poor boy himself once, and has made excellent use of the education he got with difficulty...

Speaks for Itself.

HON. P. H. JACOBS, the well-known chemist, editor of the Poultry Keeper, Farmers' Magazine, and Agricultural Department of the Philadelphia Record, says:

"I have examined carefully the Compound Oxygen manufactured by DRS. STARKEY & PALEN; also their mode of *treatment* by *inhalation*, and have noted the great benefit to those who have used it among personal friends. That it will give to the exhausted system renewed and permanent vitality, is beyond doubt."

We are in a position to indorse the above by many instances. We subjoin the sentiment of some of our patients who have been released from the clutch of that relentless ill, nervous prostration.

BUNKER HILL, IND., March 14, 1888.
"I feel that I cannot say too much in praise of the Compound Oxygen Treatment." MRS. FLORENCE BLUE.

ROCHESTER, N. Y., Feb. 14, 1888.
"It is nearly four years since I first used Compound Oxygen and I have much reason to be grateful for the treatment."
CHAS. W. CUSHING, D.D.

No. 331 Decatur Street,
BROOKLYN, N. Y., June 4, 1888.
"I was induced by a friend to try your Compound Oxygen Treatment. The result was marvelous. I certainly feel that it has prolonged my life."
MRS. E. H. HENDERSON.

We publish a brochure of 200 pages regarding the effect of Compound Oxygen on invalids suffering from consumption, asthma, bronchitis, dyspepsia, catarrh, hay fever, headache, debility, rheumatism, neuralgia; all chronic and nervous disorders. It will be sent free of charge to any one addressing DRS. STARKEY & PALEN, 1529 Arch St., Philadelphia, Pa.; 120 Sutter Street, San Francisco, Cal.—*Adv.*

FOREIGN NEWS.

SATURDAY, October 5, 1889.

THERE'S a small war scare in Europe; but it is probably a bogus affair. Several influential official or semi-official newspapers are notorious for originating these roorbacks, chiefly to aid the Ministry of their respective countries to accomplish some important stroke of domestic or foreign policy—they seek to scare either their own countrymen or foreign nations into making desired concessions. The German Cologne Gazette, Bismarck's frequent "organ," is the worst of these, and when it pipes all the others whistle. Lately it has been shrilly piping danger from an alleged great concentration of Russian troops on the northeastern Austrian frontier, and the extension of the Russian railroad system towards that part, combined with the intimate relations of Republican France and autocratic Russia. Bismarck, however, wants extra appropriations of nearly 300,000,000 marks from the Reichstag for the manufacture of cannon for smokeless powder, the construction of more iron-clads, the strengthening of fortifications and other war purposes, and fear of foreign war has a wonderful effect in loosening the purse-strings of the people: hence the present piping of the semi-official organ. War in Europe is possible at any moment, and probable ere long; but just now the general aspect of affairs is more peaceful or rather less war-like than usual..... One of the "greatest works of the age" is being quickly but energetically carried on in England—the construction of the great ship canal between Liverpool and Manchester, which will make the most important manufacturing city in the British Empire a port of entry, and render it a formidable maritime rival of the "Queen of the Mersey." The distance is 31 miles and the work was started by the Ship Canal Company on January 1, 1888. Already 25,000,000 cubic feet of the total 44,000,000 cubic feet of needed excavating has been done, and the work continues at the rate of 1,000,000 cubic feet a month. It is expected that the canal will be open for business in 3½ years at the longest..... It is wonderful how anxious all the Spanish newspapers and many others in Europe are that the South American Republics represented at the International American Congress will not allow themselves to become satellites of the United States..... In Great Britain children under 10 are legally forbidden to work and those from 10 to 12 must not work more than half time... Two Sundays ago the Republican form of government in France successfully passed through a serious crisis by securing a majority in the general elections for members of the Assembly or Chamber of Deputies, corresponding to our House of Representatives. Acting on the principle that all is fair in politics as in love and war, the Government had previously secured the self-banishment of General Boulanger, its most formidable opponent, by accusing him of grave political and financial offenses, and constituting the Senate, always bitterly hostile to him, a special court to try or rather condemn him. Owing to the exile of himself and his two most skillful and energetic supports, Rochefort and Dillon, in London, his campaign sadly lacked the impetus which his personal presence would have imparted to it, and the wisdom and reach which his able lieutenants on the spot would have given it. There were only 131 Boulangist candidates in the field—about one-fifth of the members of the Chamber of Deputies. The Conservatives, however, embracing the Imperialists or Bonapartists, and the Monarchists or Orleanists, acted with the Boulangists, giving their support to the Boulangist candidates wherever they were the strongest, and receiving the support of the Boulangists wherever their own candidates were most likely to win. The influence of the administration, from President Carnot down to the lowest public employee in the country, was energetically on the side of the Government. Lukewarm, indifferent and hostile mayors and other officials, high and low, had been previously removed or whipped into active support, and owing to such shrewd, energetic but unscrupulous precautions controlling, directing, stimulating and encouraging public opinion in favor of the powers that now be, the Republicans on the first ballot, secured 224 members against 159 of the Opposition in the 568 electoral divisions of the country. In France a clear majority is needed for the election of a member of the Assembly, whereas a plurality will suffice here. As there were more than two candidates in a large number of cases, none secured a majority in 177 electoral divisions, and in these another set of elections will be held to-morrow, when all factions of the Republicans and all parties among their opponents are likely to unite on one candidate for each side, which will necessitate a majority for one or the other. From present indications it looks as if the Republicans would have 325 against 250 held by their opponents, seven representatives from the French Colonies being included in this classification. Anyhow the Government is very sure of a fair working majority..... Of late the English Government has been trying to loosen the alliance between the Parnellites and Gladstonians by offering to found a Catholic University as a bribe to the former. This has long been a cherished object with the Irish people and especially with the priests and bishops, and great pressure has been brought to bear on the Members of Parliament to abate their hostility to the Conservative policy in other matters in return for the concession. Some of them have been inclined to do so; others have been ready to take all they can get without entering into any contract; while the bulk of them have refused to listen to any compromise tending to defer or defeat a full measure of Home Rule. The Protestant extremists of all three Kingdoms and of the Principality of Wales, among the very strongest supporters of the Government, are bitterly and loudly opposed to any concession to the "Scarlet Woman," and have been threatening all sorts of disasters to the Government should it make any. The latter, seeing that its offer gave rise to hardly a breeze of favor among its foes, while it gave birth to a hurricane of disfavor among its friends, has begun to crawfish, and now declares that it never had any intention to give a governmental endowment to the University, and so the matter is likely to lie dormant, for the present, at any rate..... Intriguing Natalie, the recalcitrant divorced wife of good-for-nothing Milan, abdicated King of Servia, is once more causing trouble. She, a Russian subject, is all for a predominance of Russian influence in Servia; he, a German, goes in for Austrian influence there. After a world of intrigue she has just returned from Russia on a visit, with the object of getting control once more of her 14-year-old son, now puppet king of the country. Her ex-husband furiously objects to her presence there, though he is himself away, and there's an almighty hubbub. Neither of the principals is worth an honest thought personally, but being used by powerful rulers for their own purposes, their disgraceful family squabbles may lead to terribly bloody battles among nations.....Reform associations in England are raising a rumpus against the British pension list, military, naval and civil, which now amounts to nearly $40,000 000 a year. The British civil pension list is quite large; while we have none here. The naval and military lists include pensions for service in the multitude of wars Great Britain has waged in every quarter of the globe since Trafalgar and Waterloo. For our two little wars and one big one the next Congress will have to provide $110,000,000 for pensions..... All the great European nations are eagerly experimenting with smokeless and noiseless gun-powder, each having its own kind. Its chief merits are that it does not attract attention and form a mark for hostile fire, and that it doesn't obscure the vision so that troops in line can fire faster and more accurately than with smoke-making powder. Its chief fault is that when troops are in line of battle firing with the excessive rapidity made possible by modern fire-arms, the effects of the concentrated fumes are so overpowering as to cause asphyxiation. It is admirable on the skirmish line, or among small, detached bodies, but of doubtful benefit among fast-firing, closely serried ranks.....

AGRICULTURAL NEWS.

SATURDAY, October 5, 1889.

A VERY destructive rain-storm, accompanied by hailstones of large size visited Philadelphia and vicinity on Tuesday evening. Great damage was done to greenhouses, many of them having every pane of glass broken, and many valuable plants injured. Some damage also resulted from lightning. Crops are generally secured, or the damage would have been much greater. .....A Philadelphia milkman is in trouble for selling milk containing 28 per cent. of water..... The Whitman Agricultural Co., of St. Louis, received the Grand Prize and Object of Art on their Hay and Straw Press after a three days' trial at the Paris Exposition. Besides the Grand Awarding Jury, the trial was witnessed by the President of the French Republic, and representatives of nearly all the European governments. Presses from French, English, Austrian and German manufacturers were in competition. The Whitman press was also awarded the Grand Gold Medal at the International trial at Turin, Italy this season. American implements seem to be in the front rank..... A lot of new California Lima beans were received at this market on Wednesday. This is remarkably early. They were of excellent quality.....The bean crop of this country is unusually short this year, but prices are not likely to be extremely high, as foreign beans have grown into favor within the past two or three years, and large quantities of them of very good quality are now being imported..... The barns of a farmer near Asbury, N. J., burned recently, with all their contents, causing a loss of several thousand dollars. Cause: a boy, a lighted match, and a wisp of hay projecting from a knot hole; a dangerous combination..... Floral Hall on the fair ground at Attica, N. Y., was destroyed by fire.....Some of the West India Islands which usually get their supplies of flour from this market are sending orders for wheat, proposing to do some grinding on their own account.... ....The Farmers' Review reports that the potato crop of '89 will probably exceed in quantity any previous crop in the United States. The yield is estimated at 233,700,000 bushels, an excess over last year of over 17,000,000 bushels. This is indeed "good news if true," for the general belief has been that the crop would prove a very small one..... At the Paris Exposition Walter A. Wood has on exhibition a straw-band binder. The machine is an experimental one. Mr. Wood says that he had on exhibition at Vienna in 1873, a machine for binding grain with wire which was not so near perfection as his straw-binder now is, and yet he placed the wire-binder on the market within three years. He has great faith in the ultimate success of his straw-binder. If this machine be perfected, it will effect a saving of millions of dollars annually to the farmers of this country for binding material..... Prof. Riley who has been at the Paris Exposition in the interest of the Department of Agriculture for the past five months, has returned to Washington. Prof. Riley thinks many of the criticisms upon the American exhibit have been unjust, although the display did not do the country full justice. Still, he thinks it reflects credit upon the country. It was surpassed by the exhibits of but three countries, France naturally being first, with Belgium and England second and third respectively. The agricultural exhibit from the United States received commendation from all sides, and was regarded as the most characteristic of all the A nerican displays.....

DOMESTIC FRUITS AT AUCTION.

SATURDAY, October 5, 1889.

THE FIRST auction sale of Eastern fruit was held by E. L. Goodsell at his auction rooms 103 Park Place, on Tuesday afternoon, and consisted of one car-load of Concord Grapes shipped by the Chautauqua Grape Growers' Association. The fruit arrived the same day, each basket being stamped with the association's brand and also with the grower's name; it was packed in 10-pound baskets, and evenly graded. Each grower's fruit was placed in a separate lot, and samples of each were exhibited. In this way, if any grower had packed inferior fruit, or graded it imperfectly, his negligence would result in his own injury only. The grapes were offered in lots of 40 baskets, the highest bidder having the privilege of choosing from any lot that number, or taking the whole lot. Then the balance were offered in the same way, and so on until all were sold. The first lot sold for 30 cents per basket, one lot sold for 25 cents, the bulk of them selling for 26 with some at 27 and 28, the car-load averaging about 27 cents per basket. About 15 minutes were consumed in the sale, every basket was sold, and within 24 hours the check for settlement was on its way to the shippers. At the time of this sale; commission merchants were selling the same grade of fruit for 25 cents per basket in lots to suit the purchaser, and many of them were carrying stocks that could not all be sold, and would be thrown on the market next day at, in many cases, greatly reduced prices. It will be seen that in the matter of quick sales and prompt returns, the auction system is greatly to the interest of the grower.

THE AUCTION system of disposing of perishable fruits was adopted by several firms in London and Liverpool, about 20 years ago, in deference to the growers who were dissatisfied with the system of selling and with the returns they were receiving. An ignominious failure was predicted, and the idea was denounced as impossible. Suffice it to say, the results have proved far otherwise, and the system is the established way of selling perishable fruits. Three years ago the California fruit-growers did not believe in this system, but to-day the by-laws of the two large Unions of growers and shippers say that the fruit must be sold at auction.

THE ADVANTAGES of this system over the old method of consignments to commission merchants are many. One of the most important is the immediate and total sale of fruit upon its arrival, before it has any chance to deteriorate; losses of this kind of course must be borne by the producer. Everything is sold and returns are made at once. In selling through the commission houses, 50 fruit-growers may ship to as many different commission men. The jobbers in search of fruit go from one to another beating down the price, and these 50 commission men are virtually competing with each other to make sales. This cannot fail to depreciate prices. Under the auction system, these 50 growers will combine and ship their fruit together to one house. Railroad facilities are such that the time of arrival is definitely known, and the sale can be advertised, together with an exact catalogue of the goods to be offered. The jobbers meet and instead of going from one place to another in search of the commission man who will give them the lowest prices, are forced to become competitors, and the highest bidder secures the fruit. A comparison of the two systems shows the advantage of the one over the other in this direction.

WILL IT SUCCEED? We think it will. There is powerful opposition from the commission men. As one of them remarked: "We shall fight it to the last ditch, because if it prove successful, it will take away our bread and butter." The system is firmly established in England; California fruits are sold in this way in all the Eastern cities; Florida orange-growers are moving to have their fruit sold in the same manner. There is no apparent reason why the system should not be extended to include all perishable fruits and vegetables, and why it should not be successful. Of course, the system is not yet perfect, but, as time reveals weak points, they will be remedied. The greatest obstacles to be overcome are at the producers' end of the line. The producers must combine, and ship all their products to the auction house. This gives them control of the goods and the jobbers must come to them. Another very important requisite is that all products must be evenly graded, and packages must be of uniform size. This necessitates organization and co-operation on the part of shippers and producers. One noticeable feature of the auction sales of fruits in this city is the fact that the finest and most carefully packed fruits are the most sought after and invite the sharpest competition. Some dealers say they prefer to buy of commission-men, because they can find with them any kind of produce they wish to buy, but the ultimate object is to apply the system to all kinds of produce that are now sold in the markets. The commission-men many times turn retailers themselves to dispose of lots they do not wish to carry over, thus becoming competitors of the regular dealers, and tending to still further depreciate prices. This the auction system will not do. As the auction house acts as an agent of the shipper, a vast number of middlemen are dispensed with, and this, of course, must result in a considerable saving of fees. The modern method of selling goods is by sample. The wholesale grocer does not equip his salesman with barrels of sugar, boxes of teas, and bags of coffees; he furnishes him samples of the goods offered which represent his stock, thus enabling him to transact a large amount of business in a small space of time. This is precisely what the fruit auctioneer does; he shows samples of each lot and variety offered, from which sales are made, and the fruit is transferred direct from the cars to the purchasers' stores, avoiding unnecessary handling and enabling the auctioneer to make large sales with great rapidity.

MR. GOODSELL, who is the pioneer in the auction trade in this city, has every facility for conducting the business, and is very enthusiastic as to its ultimate success. He says that with shippers combined, and the business reduced to a system, he could handle every package of produce coming to this city. Since July 1, he has sold over $200,000 worth of California fruits, and the interest in these sales is on the increase. His idea is to develop the business to include all kinds of produce, having hourly sales of different lines of goods, beginning at three o'clock, a. m., and continuing throughout the day.

WHEAT does not show the advance in price that circumstances would seem to warrant. There is a heavy demand from local mills all through the interior, and stocks of flour are small; this coupled with the demand from many foreign markets should make a stronger price, but the gamblers unsettle everything connected with the market so that it is impossible to make any predictions. Left to the legitimate law of supply and demand, good grades of wheat would be higher.

MAGAZINE REVIEWS.

"A PECULIAR PEOPLE" in Harper's for October is descriptive of the Dunkers or German Baptists living at Ephrata, about 15 miles from Lancaster, Pennsylvania. In many ways they resemble the Quakers or Friends. Their style of living, manners and customs are very primitive. Their dress is very quaint and old-fashioned; they offer no resistance to injuries, and refuse to take oaths in courts of law. Their religious customs and ceremonies are equally curious. They aim to imitate the early Christians as far as possible. The buildings are now nearly in ruins, and only a few stragglers are left of a once prosperous and happy community. A favorite theme with orators and authors nowadays is the possibilities and probabilities of the future as to wonderful inventions and discoveries, especially those connected with the electrical field. Edward Bellamy tells of a mythical railroad journey undertaken with some reluctance because of his inability to read on the cars. He was very agreeably surprised to find all the popular books and magazines phonograped and accessible even with his eyes shut; they could be begun at any chapter or page and any part could be skipped. Before recovering from this agreeable surprise he was startled by hearing the name of his station announced in such clear, deliberate tones as no trainman had ever thought of using. Going to a hotel to spend the night he enjoyed a refreshing sleep until awakened by the voice of what he judged to be a very charming young woman who said: "My dear sir, you may possibly be interested in knowing that it now wants just a-quarter of three." Upon lighting the gas, he failed to find anything excepting an innocent-looking clock which soon announced the hour of three in the same thrilling tones to which he had before listened. Sleep was no longer possible with such pleasant company. At breakfast his morning paper was rehearsed in his ear by a wonderful mechanism. His friend whom he came to visit took him to a clock factory where were clocks of all kinds of beliefs: then to a book-store filled with all kinds of phonographic books. He found himself surrounded with all sorts of new-fangled contrivances on every hand. The author has given us a very readable and ingenious story. "Aunt Dorothy's Funeral" is a Virginia plantation story of *ante bellum* days, but the title is somewhat misleading, for instead of "ole missus" furnishing a subject for a funeral, she recovered and had a thanksgiving service instead, with a sermon from the text she had selected for her funeral discourse. A betrothal was also announced at this time much to her satisfaction. "The Fair of Nijnii-Novgorod" is described by Theodore Child; "Hierapolis and its White Terrace," by Tristram Ellis; and "The Building of the Church of St. Denis" by Charles Eliot Norton. There is an article on "Recent Progress in Surgery;" a description of a "Corner of Scotland Worth Knowing;" a story, "Captain Brook's Prejudice," and much other interesting matter, with numerous illustrations and a few poems. Harper & Brothers, New York.

THE CENTURY MAGAZINE completes its 19th year with the October issue. The number is a specially interesting one. Mr. Kennan's article deals with the "East-Siberian Silver Mines," and gives a clear idea of the wretched surroundings of the convicts who are obliged to labor in these mines. He is of the opinion, however, that life here is preferable to solitary confinement in the ill-ventilated and filthy prison kameras. The Lincoln History deals with "Blair's Mexican Project—The Hampton Roads Conference—The XIIIth Amendment." An article of special interest to artists is "Fra Filippo Lippi," one of the Italian Old Masters, by W. J. Stillman, with an engraving and explanatory notes by T. Cole. "Moliere and Shakespeare" by C. Coquelin, with an engraving of Moliere as a frontispiece, is a comparison of these two great authors. "Base-Ball—For the Spectator," gives a history of the "great American game," with an explanation of the leading rules of the game which will enable one not versed in the art to have a fair understanding of it. "Three Jewish Kings" is a richly illustrated article by Edward L. Wilson and will be of particular interest to those who are students of the International Sunday-School Lessons. A story which will be appreciated by newspaper workers is "The Longworth Mystery" by "The City Editor." It is written by Young E. Allison, one of the new Southern writers. Maurice Thompson contributes "Ben and Judas," master and slave, a Southern dialect story, which is very readable, despite the unpopularity of dialect stories, and abounds in humorous situations. The third and last part of "The Old Bascom Place" is given. "Maria Mitchell's Reminiscences of the Herschels" is of peculiar interest in view of the recent death of that talented woman, and famed astronomer. The article is illustrated by fine portraits of Miss Mitchell and her observatory at Lynn, Massachusetts. Anna C. Brackett also has an "Open Letter" on Miss Mitchell. There are several brief illustrated articles on manual training from different standpoints. "War Diary of a Union Woman in the South," edited by G. W. Cable, is a thrilling narrative of a Northern woman in Louisiana and adjacent States during those perilous times. There are several short poems, interesting "Open Letters," etc. The Century Co., New York.

ST. NICHOLAS abounds in short stories from numerous writers on a variety of topics. "Almost a Tragedy" by Celia Thaxter is a story of a cat and parrot which lived in a kitchen and were the best of friends. The parrot's inquisitiveness led her to investigate a huge pan of dough which had been set to rise, and which proved a veritable quicksand into which the poor bird sank until nothing, but her head was visible. The sagacious cat by summoning the servant saved her from an ignominious death. William Dudley Foulke tells about "My Dog." It had always been his ambition to own a genuine St. Bernard, and at last when crossing the pass he purchased one from the Hospice. It proved a veritable white elephant, both on his travels, and after reaching America. Finally after a world of trouble, the dog, which had been the dream of his life, and which had cost him in hard cash in the neighborhood of $500, was sacrificed for a paltry $75, a goodly share of which was absorbed by a dealer in commissions, etc. Julian Ralph tells "Where Salmon are Plentiful," and fortifies his fish story by an engraving made from an indisputable photograph of a salmon brook in British Columbia. The water is represented as literally alive with the finny tribe. Our party of boys who have been spending the summer vacation "Among the Florida Keys," end it with this number, with a largely increased knowledge of Natural History. F. S. Dellenbaugh under what he calls "The First Americans," describes the Pueblos found in Arizona and New Mexico. What warrant he has for giving them this title he fails to tell us. "The Making of a Great Steel Gun" describes the manufacture of a huge cannon from the making of the steel from iron, until the gun is finished ready for its deadly work. Dora Miller's "Wonder Ball" contains suggestions of holiday times. There are charming bits of verse, numerous and interesting illustrations, and many other features which tend to make this an attractive number to the young folks. The Century Company, New York.

BOOK REVIEWS.

"SPEAKING PIECES for Little Scholars and Older Pupils," by Ellen O. Peck, is Lee & Shepard's latest addition to this useful class of literature. It is divided into two parts, the first for the little people, the second for the older boys and girls; and consists of short selections for school entertainments, Easter and holiday occasions, anniversaries and the like, together with dialogues and charades. Boards, five by seven inches; 177 pages; price 50 cents.

AN ambitious new juvenile book having a Munchausen flavor is "Little Baron Trump and His Wonderful Dog Bulger." It portrays his birth in the very mushy land of the Melodious Sneezers; tells how when he was about two months old his mother, taken unawares by a fit of sneezing, dropped him into the soft mud, in which he disappeared, and from which the almost human Bulger rescued him; pictures the marvelous growth of his brain, and follows him and his dog through hair-breadth escapes and thrilling adventures among the Wind-Eaters, the Slow-Movers, the Man-Hoppers, the Round-Bodies, etc. It does not profess to be a story with a moral, yet it instils reverence for parents and affection for dumb animals. Seven by nine inches; 287 pages, cloth, illustrated, $2. Lee & Shepard.

EVERY-DAY BUSINESS is a small book filled with valuable information about common business affairs which every one should know. Many farmers are deficient in a knowledge of the simplest rudiments of business, and trust too much to the honesty of lawyers and others. This is a very poor practice, and one that many times proves very expensive. This little volume gives plain directions about letter-writing; bills, receipts and accounts; post-office business; telegrams; express business; United States money; different kinds of banks, bank paper, checks, notes, drafts, etc.; mortgages, taxes, insurance, etc. Five by seven inches; 158 pages; boards, 35 cents. Lee & Shepard, Boston.

BENJAMIN FRANKLIN is the title of the latest addition to the American Statesmen series. The author is John T. Morse, Jr., and he has given us a very well-written and exhaustive biography of this illustrious American, who was at once a patriot, a philosopher and a statesman. Five by 7½ inches; 428 pages; cloth, gilt top; $1.25. Houghton, Mifflin & Co., Boston.

Law.

"Every Man is presumed to know the Law. Nine-tenths of all Litigation arises from Ignorance of Law."

RAILROAD FENCES IN CONNECTICUT.

J. G., Plainville, Conn.—Who should erect the fences on both sides of the railroad tracks and to whom do they belong? If an animal should break through, or through the defective state of the fence stray upon the line from adjoining land, and be killed, can the owner recover compensation?

ANS.—In Connecticut every railroad company is required to construct and maintain good and sufficient fences on both sides of its line, except at such places as in the opinion of the railroad commissioners, the erection and maintenance of the same shall be inexpedient or unnecessary, under penalty prescribed by the statute. Such fences must be erected by all companies within 12 months after they have entered upon and taken possession of the lands through which the railroads pass. Such fences belong to the railroad if on its own land. Some owners of land adjoining railroads, however, have received compensation for fencing along the line of their land, and where this has been the case, the obligation to fence is permanently binding upon them and upon all who may come into possession of the land. All such holders are required by law to build and maintain a lawful fence on said line or as near thereto as they conveniently can; and if they neglect to do so within 60 days after they have been notified to do so by the railroad company, such railroad company may build the fences and recover the expense thereof in an action for debt against the person neglecting to build or maintain such fence or fences. Where the duty of building the fences rests on a railroad company, if cattle or any other domestic animals break through a fence on account of its insufficient or defective character and are killed or injured on the track, the company is responsible for damages; but if they broke through or jumped over a sufficient fence in proper repair, the company would not be responsible. When the duty of building the fences rests with the land-owner, of course, he cannot recover compensation for cattle or other animals that may have been trespassing on the railroad through his own fault.

LEWISTON, IDAHO.

Various,

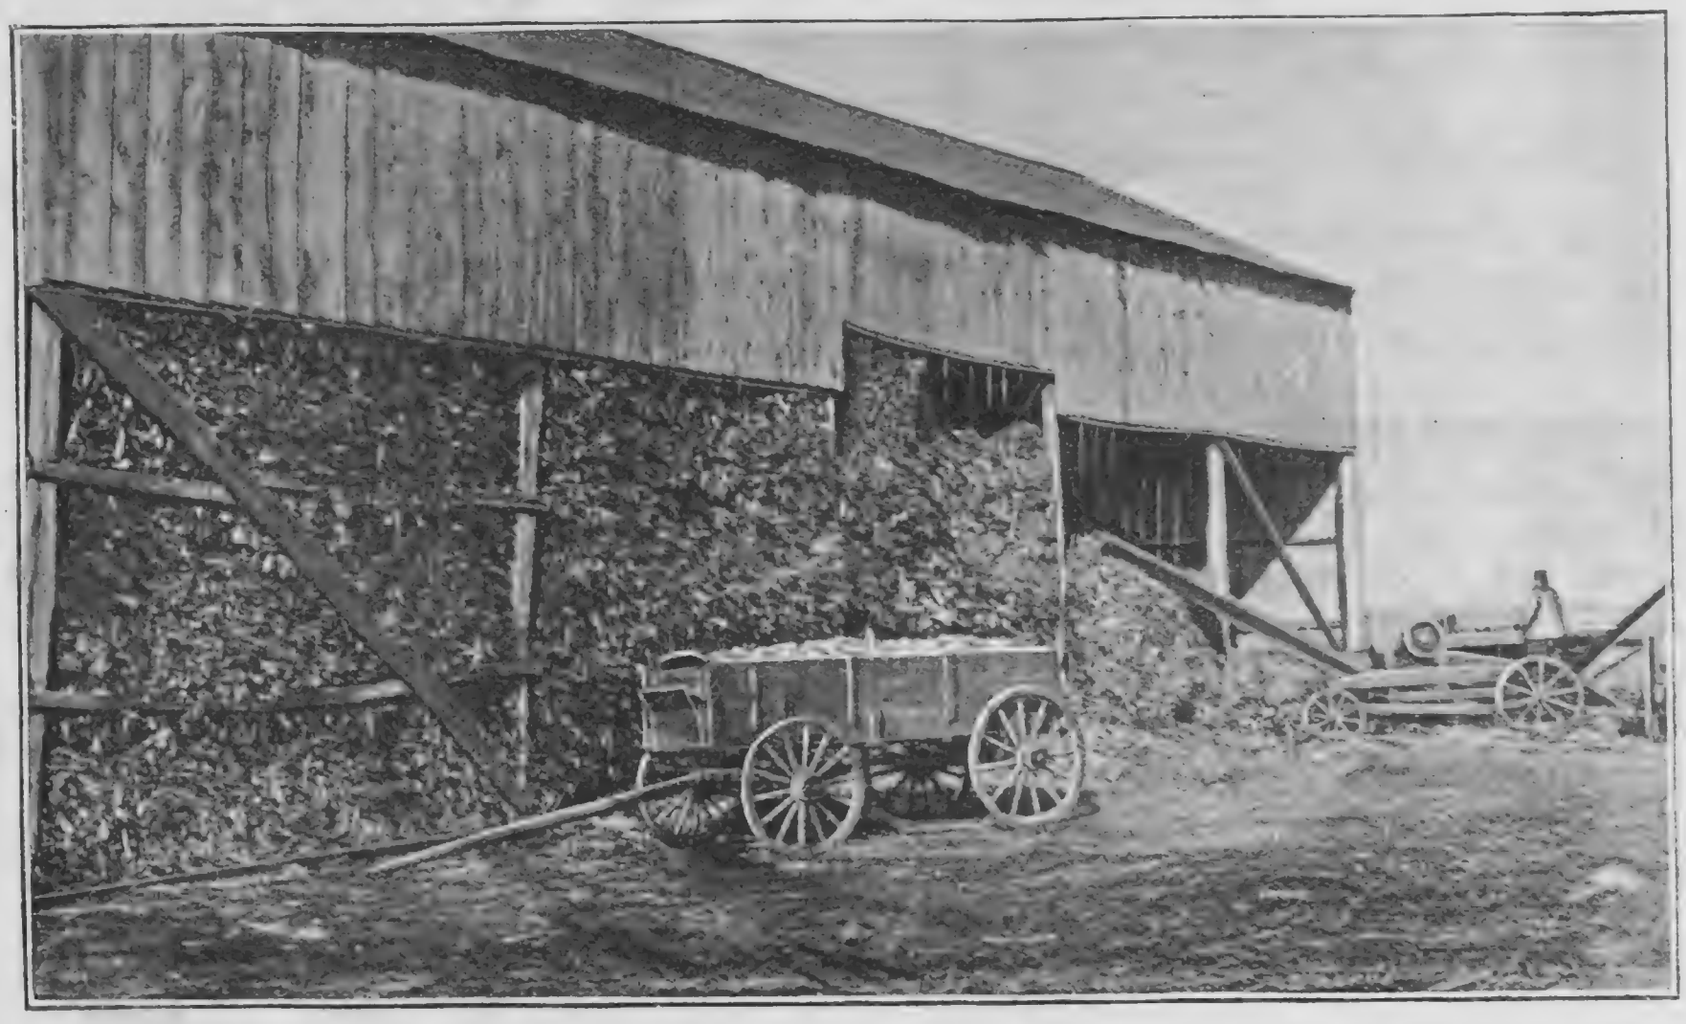
A JERSEYMAN'S JOTTINGS.

I MAKE my city-farmer neighbors quite useful in the way of experiment work. They don't believe in the slow ways we Jerseymen have inherited. They are after all the new machines and methods. I watch their trials and often gain a good point from their experience. The latest thing in this line relates to a new churn. For a great many years our folks have used the old-style dash churn. I have read a great deal about the advantages of a churn without any dash but our folks were used to the dash churn and would not listen to any argument against it. That is the spirit that has made New Jersey famous. My neighbor bought a fine cow last year. As a part of the bargain he got a stone churn with a wooden dash. That is the only kind of churn used in our neighborhood, and all the dairy-wives to whom my neighbor's wife went for information, were sure that the new-style churns were poor things. Your city farmer is a great reader of the agricultural papers. Of course my neighbor read all about the new churns and wanted to try them, but everybody told his wife the dash churn could not be beaten and so he had to give up his experiment. At last his hour came. Somebody dropped that stone churn on the door-step and broke it. If it had been made of wood we should never have had our experiment. Now the point was to get a new churn. "Frank's Wonder Machine" was first tried. This promised to take all the butter out of sweet milk and leave the residue about as good as it was before. No pans, skimmers or cream pails would be needed.

This machine did make butter in about five minutes from whole milk. The butter did not suit, however; it was soft and very light-colored. The "wonder machine" did not seem to make as much butter as was obtained in the old way. Then my neighbor bought a toy called "Daul's Butter Machine." This was an arrangement of cogs and wheels that shook a Mason's jar filled with cream to and fro. It made butter, after a fashion, but it gave such a clatter and bang that it nearly made the folks sick. Then some economist wrote an article for the paper telling how the ice-cream freezer was used as a churn. According to his statement a churn was never needed in a family that boasted an ice-cream freezer. So our friends tried that. After turning the handle nearly two hours a sticky, light-colored mass formed that had to pass muster as butter. Then the wife made a demand for another dash churn—a wooden one this time—but the man of the house was determined to try a churn without any dash or float. So he bought a Rectangular Churn.

It was about the most awkward-looking thing I ever saw—just a large box fitted on standards so it will turn over "cornerways." I went over to see the thing work. We poured the cream into it—adding a little milk to make the mixture thin—fitted on the cover and started the handle. I never heard quite such a splashing as the cream made inside that churn. There are so many corners and angles about it that the beating about was something tremendous. The work was very easy. I can fit a treadle on the handle so that a person can sit and read and make the churn go with the foot. I do not hesitate to say that my examination of the Rectangular Churn convinces me that our folks have all been wrong in sticking to the dash. I am satisfied that this new churn makes more butter—that is, you save more of it—with less work than our old churns ever did. The cost of the new churn is considerably more than that of the old one, but you will probably more than get the difference back before the churn gives out. How the Rectangular compares with other barrel or box churns I do not know. I should think it would give the cream more of a shaking up than any of the others owing to its special shape. This very shape makes it very easy to clean. I don't much like the way the cover is made to fasten on. It strikes me the fastenings will soon wear out and cause the churn to leak. There is danger too of using the little cork plugs. They should be larger and fastened to the churn by strings or little chains. It would be a good thing also to have a little glass door or window in the churn so that the churner could watch the cream and know better when to stop. There seems to be a different sound inside the churn when the butter begins "to come." I suppose that a man with good ears can study this difference in sound so that he can make it his guide in stopping the churn. A deaf man, however, cannot detect this difference and the consequence is that he must keep taking off the cover or run the risk of overchurning.

JERSEYMAN.



A WESTERN BARN FILLED WITH CRUSHED CORN-FODDER. FIG. 255.

CATALOGUES, ETC., RECEIVED.

PATCH'S CORN-SHELLER.—Catalogue from A. S. Patch, Clarksville, Tenn. This pamphlet contains letters from those who have used the "Black Hawk" Sheller. If we may believe what they say this sheller is a wonderful affair.

THE ART OF DRESSING.—This is the subject of a little volume sent out by O. S. Chaffee & Son, Mansfield Center, Conn., and with the information will be sent samples of the black silks and satins which this well-established firm has for sale at reasonable prices. Our lady readers who desire to dress with good taste and judgment, will want to see these samples.

THE PRUYN POTATO-DIGGER.—Catalogue from the Pruyn Potato-Digger Company, Hoosick Falls, N. Y. One great point of superiority claimed for this digger is its light draft. It raises but little earth and gets rid of it easier than other large diggers. In fact, there are many things about the Pruyn Digger that commend it to the thoughtful consideration of farmers. Send for this circular and see what the digger looks like.

FIRE-ARMS, CUTLERY, ETC.—Catalogue from Powell & Clement, Cincinnati, Ohio. We find in this catalogue a fine list of guns, pistols, knives and sporting goods. It is hard to conceive of anything in this line that is not described here.

A NEW CORN PRODUCT.—The R. N.-Y. has had considerable to say about the great waste of labor spent in husking the country's corn crop. Another point that has been dwelt upon is the waste of the corn fodder—the stalks of the corn plant. Now comes a machine, the Keystone Corn-Husker and Fodder-Cutter, that promises to go a long ways toward putting a stop to these wastes. By its means we may expect to make hand-husking of corn about as profitless as hand-thrashing of grain. The stalks are so cut and crushed that the product may be baled and sold to be used as fodder or as an absorbent. We show, at Figure 255, a scene on the farm of Gale Brothers, of Galesburg, Ill. The building is a shed, 22 feet high, 30 feet wide and 80 feet long, and is filled with the fodder as it came from the husking machine—which is shown at the right of the picture. The wagon at the center is filled with husked corn. The fodder, as packed in the shed, occupies about one-fourth the space needed before it was cut up. Last year the Messrs. Gale put up the fodder from 123 acres of corn, and this year expect to put up 400 acres. After the fodder had heated in the pile part was baled with two strands of wire, the same as hay in a Dederick Hay Press. The R. N.-Y. believes that this baled product will find its way to the markets in due time and by its sale open a new source of revenue for corn farmers. The subject is an interesting one. Those who wish to investigate it further should send to the Keystone Manufacturing Company of Sterling, Ill., for an illustrated catalogue.

DUTCHESS COUNTY AGRICULTURAL SOCIETY'S SHOW.

(RURAL SPECIAL REPORT.)

THE 48th Annual Fair and Cattle Show of the Dutchess County Agricultural Society was held at the Hudson River Driving Park, Poughkeepsie, from the 24th to the 27th of September. A new main building and a number of new cattle sheds have materially increased the attractiveness of the fair. The larger part of the room in the main building, however, was taken up by local merchants, leaving comparatively little room for fruits and vegetables. Implements were shown in tents adjoining the main building. Adriance, Platt & Co. showed their new harvesting machine in operation. It is certainly a wonderful improvement on older and more cumbersome reapers and harvesters, and will, doubtless, have a very large sale. The cattle sheds were well filled. The well-known herd of Guernseys owned by Vice-President Morton attracted much attention. J. B. Dutcher & Son showed some very fine Holstein-Friesians. The sheep and swine pens had but few visitors, although many fine specimens of the newer breeds were shown. The poultry building was dark and crowded, the ventilation was bad, and altogether it was an unattractive place even to the poultry fancier.

On the whole, the Dutchess County Fair comes far short of the place claimed for it by its managers. It lacks very much of being the largest and best county fair in the State. In fact, if the horse racing, balloon ascensions and side-shows were done away, there would be but little left save an exhibit of local merchants for advertising purposes. Notwithstanding the bad weather, the attendance was very large and there is no reason why the fair, with judicious management, should not attract a much greater number of implement dealers, fruit growers and other exhibitors who make a fair of interest and value to the agriculturist.

A DISAPPOINTMENT.

"I WISH," said lazy little Paul,
"Oh! how I wish that I,
Instead of climbing this stone wall,
Straight over it could fly."

But when old "Brindle's" crumpled horns
Had tossed him from the ground,
And o'er the wall upon some thorns
A resting place he found,

His views completely altered seemed,
And, trying not to cry,
He gasped: "I'm sure I never dreamed
How horrid 'tis to fly!"

Burpee's Big Bean!

DWARFS vs. POLES

FROM H. M. ENGLE.

BUSH BEANS are preferable for early cropping and the saving of poles. Pole beans will yield larger crops. Farmers in this vicinity plant pole beans with corn and they yield fair crops with the least possible labor and expense. They are generally planted after corn is up four to six inches.

Lancaster County, Pa.

FROM FRED GRUNDY.

FOR string or snap beans I prefer the dwarf varieties because they are somewhat earlier than the running sorts, take up but little space in the garden and are out of the way in time for a second crop. Two plantings, eight or 10 days apart, are made. We do not try to extend the season further by successive plantings. There is no Lima equal to the old large Lima. Most of the so-called "improvements" are in the wrong direction. When grown on poles the beans are off the ground where they keep clean and ripen perfectly. A sprinkle of rain will stain or rot every bean that touches the soil. If only the end of the pod touches the ground the beans are quickly spoiled by a shower when they begin to ripen.

Christian County, Ill.

FROM ISAAC HICKS.

WE think the German wax beans and the other varieties of wax beans are the best for family use. They should be planted at intervals so as to afford a succession through the season. I want no pole beans until the Limas are in season. These are as yet unequaled and will repay all the care and trouble of furnishing poles: at any rate they do with us on Long Island. For quality and because they require much less labor and space we prefer the wax podded bush beans. Henderson's Dwarf Sieva Bean is productive and as good as the pole Carolina or Sieva, and earlier than the Lima and desirable on that account, and also for economy of space. One year's trial with it is satisfactory, and I shall continue to plant it. I do not grow any of the Kumerle Limas and can give no opinion with regard to it except by seeing it in another place. It did not seem equal to the Lima and with the lover of good rich beans I do not believe either kind will supersede this.

Queens County, N. Y.

FROM A. B. COLEMAN.

I DO not deem dwarf or bush beans more desirable than pole beans except in earliness, and perhaps because they can be grown with less expense and labor. I am partial to pole beans. They are more prolific, of better quality, and will bear until frost kills the vines if properly cultivated. Bush beans soon become tough and unfit for the table unless shelled, while pole beans are ever-bearing. In localities where it is expensive and inconvenient to obtain poles or other suitable material for "sticking" pole-beans, it would doubtless be desirable to grow bush beans alone and plant in succession. There are many varieties of pole beans which can be grown successfully in corn fields, where they are allowed to run on the corn plants. This is the cheapest way to grow them. I have not yet grown Henderson's Dwarf Lima, and cannot speak of it from personal experience. Two of my neighbors tried it this year, one of whom succeeded very well with it, and he thinks it a desirable novelty. It is, however, no better in quality than the old Sieva and not so prolific. Except as a matter of convenience, I prefer pole beans.

Caldwell County, Kentucky.

FROM N. HALLOCK.

I PREFER the dwarf bean, for it occupies less space and is easily cultivated. With it, too, there is no expense for poles, which are unsightly in a well-kept garden, and as there is no pole bean that is superior to our best bush beans, I have given up raising pole beans for family use.

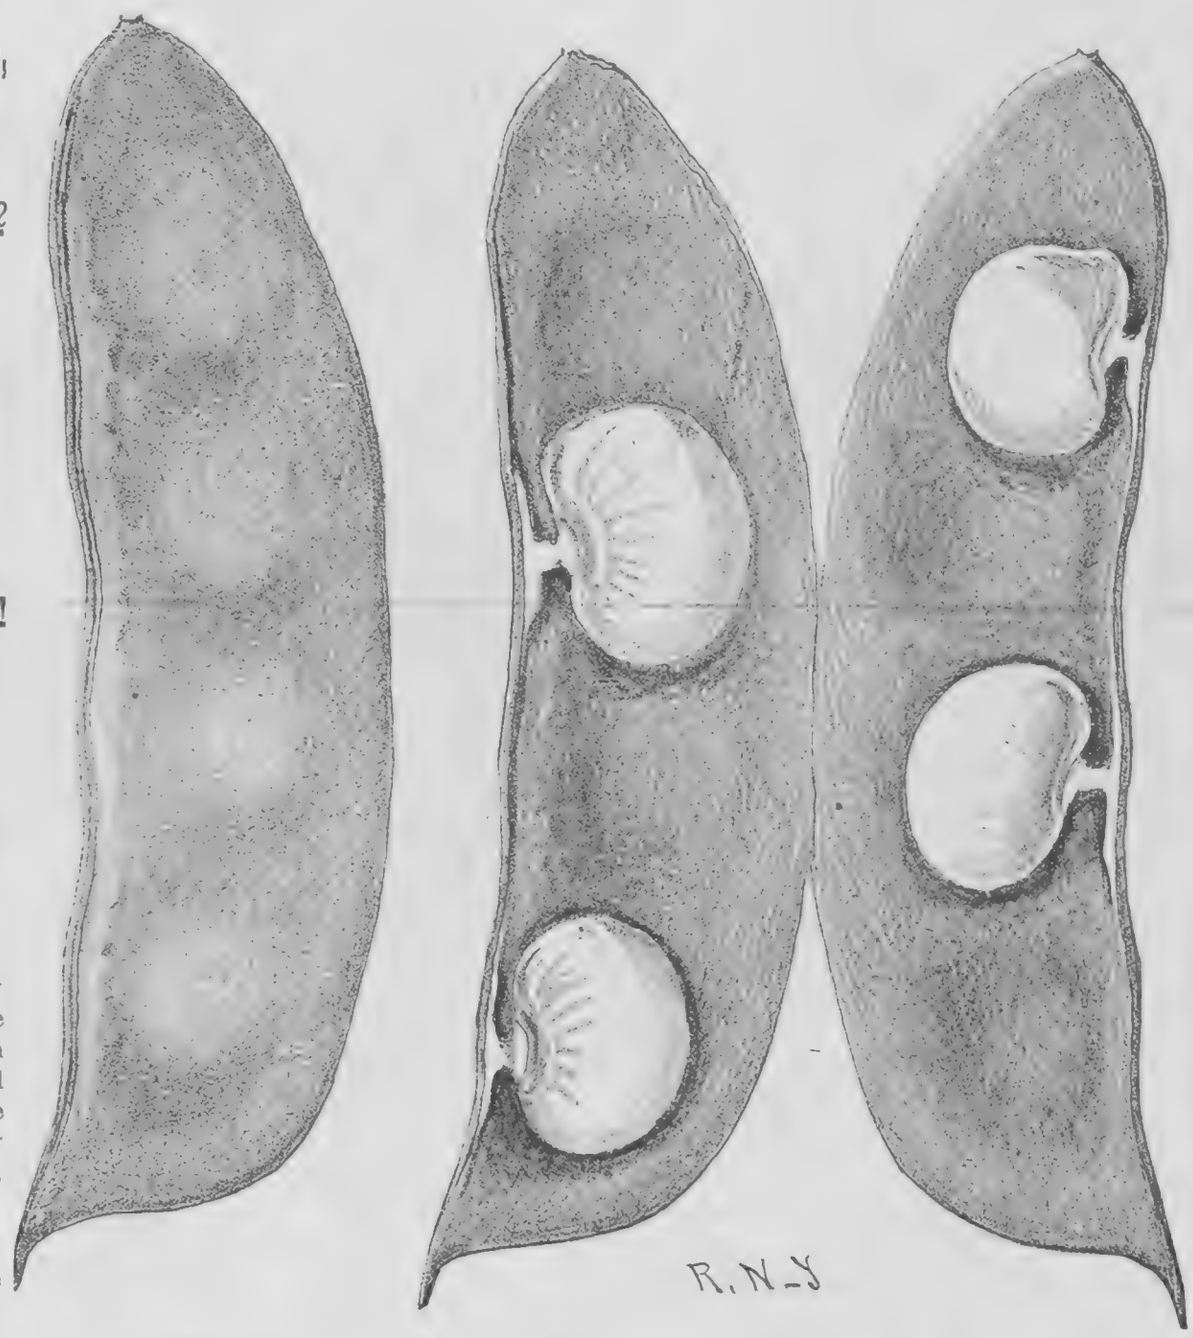
My preference does not extend to Henderson's Bush Lima, as it lacks the quality that gives the Lima its popularity. Many of our snap beans are as good to shell and cook green as the bush Lima. A friend who planted $5 worth, when asked his experience with it, said: "I do not value it." The other I have not seen growing.

Queens County, L. I.

FROM D. LANDRETH & SONS.

We do not know Kumerle's Lima. We have known the bean advertised as Henderson's Dwarf Lima. We never considered it worthy of a boom. It is a dwarf Carolina or a dwarf Sieva and not a Lima at all. We prefer bush beans to running beans, as they require less outlay in preparation. Few pole beans, however, are suitable for transforming into dwarfs, for the weight of the pods on long foot-stalks will always have a tendency to extend them down to the ground where many will be destroyed by contact.

Philadelphia, Pa.



BURPEE'S BUSH LIMA. FROM NATURE. NATURAL SIZE. FIG. 259.

THE DWARF LIMA BEANS.

WILLIAM FALCONER.

I HAVE been much interested in these little strangers and watched their progress this summer attentively. We have two kinds, namely, Henderson's, and Kumerle's (Thorburn & Co.). I have grown them both in good, level, sheltered ground and in rows three feet apart and side by side. Both were sown on the 17th of May, and every seed germinated and gave me a good fruitful plant, and to-day—September 9th—I have taken an average plant of each kind from the middle of the rows for examination. Now that the fall is approaching I have discovered a new use for Dwarf Lima Beans. Tall Limas are very tender and the first frost injures them; anyhow, if we can manage to save them into October we find the supply of young beans is short, for the vines do not pod well after the first of September. But the dwarfs are at our mercy, not we at theirs. We can put in June and July sowings on warm, sunny land just as we do snap beans the end of August and first of September, and cover them over with frames and sashes, and in this way have fresh, green Limas as long as we can keep frost out of the frames, which, here on Long Island, may be well into November. This alone will render the Dwarf Limas, to me at any rate, a welcome and, after this year, an indispensable addition to our list of vegetables.

HENDERSON'S DWARF LIMA belongs to the section of Limas usually called Sievas and is a positively dwarf variety and without the least inclination to "run." The plants are very bushy, low and stocky and their main stem does not rise over a foot above the ground, but it is freely branched and these shoots together with the flower-spikes raise the hight to some 16 or 20 inches. The plants have kept green and healthy all summer long, and since they first came into bloom they have remained continuously in flower and are still so, and this is a little better than the late Sievas have done. The flower-spikes are terminal, very long—often 12 or 14 inches—and in several cases have borne 20 pods to a spike; but the average number of pods matured is seven. The pods are about three inches long and contain two, three or four seeds in each, but mostly three. The beans are plump, of good form and average Sieva size, and of most excellent quality when cooked. The plant now before me is 16 inches high and 36 inches across, very bushy and has 19 flower sprays. It has 79 well developed bean pods; 38 of these are dry ripe, five fit for use, and 36 unripe or too young for use. This would indicate 43 pods as an average early crop; the 36 unripe pods are the result of a second spurt. This whole lot of beans, pods and all, ripe and unripe, weighs just 63 ounces.

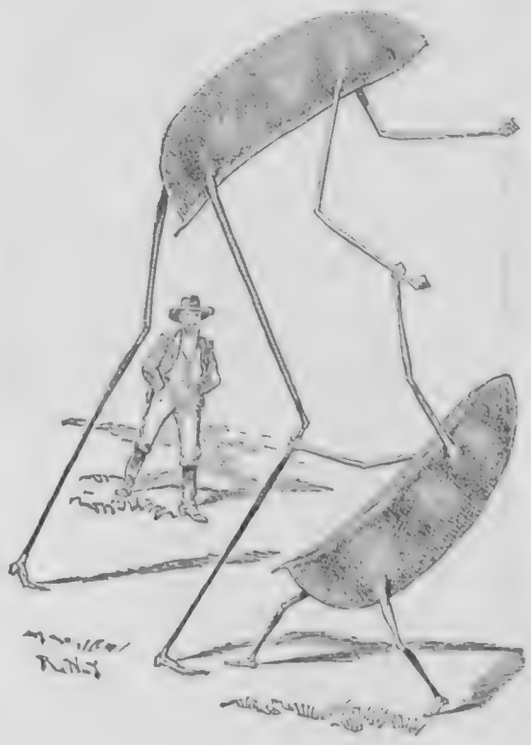
Sown May 17, we gathered our first beans July 26, just at the same time as we did ordinary Sievas sown at the same time, and 10 days ahead of large Limas sown on the same day.

KUMERLE'S DWARF LIMA belongs to the large-seeded or ordinary Limas and is a fixed dwarf variety. The plants have fine, healthy foliage. In habit they hug the ground rather than rise up a little in bushy form. Each plant makes four or five leading branches which at first are short-jointed. The flower spikes are axillary, short-stemmed and terminated by a few close-together flowers. The pods are short, unusually thick and knobby, displaying the seeds inside by prominent knobs; and one, two or three of these pods, but mostly one or two are borne, terminating each spike, and they contain two, three, or four beans each; but mostly three. The beans are very chubby and pressed so closely up against each other in the pods as to indent each other. Cut across lengthwise they measure seven-eighths of an inch (less than an average large Lima) and almost half an inch (more than a common Lima) in thickness. The quality when cooked is not as good, in my opinion, as is Dreer's Lima. The plant now before me has five branches, two of them spreading out three feet long, and the other three only 20 inches. While it was setting its crop of fruit this plant was no more than 20 inches long (I cannot well say "high," for it doesn't rise up); the extra length of the two branches has been a sport of a few weeks. At the same time there is no inclination to climb in any of the plants. It has borne 25 pods, all well filled and seven of them are now dry ripe; and all together—beans and pods—they weigh just eight ounces. It is still full of flowers, especially on the new growth; but shows little inclination to continue to set fresh pods; indeed, it is much more of a one-crop nature than are the large Limas of any variety. In point of earliness it is about the same as the common Limas; they all differ a little according to season and circumstances. Judging by its behavior this year, I should think if one depended on this dwarf Lima for beans, he would have to make successive sowings, the last as late as the end of June.

DWARF VS. POLE BEANS.

C. L. ALLEN.

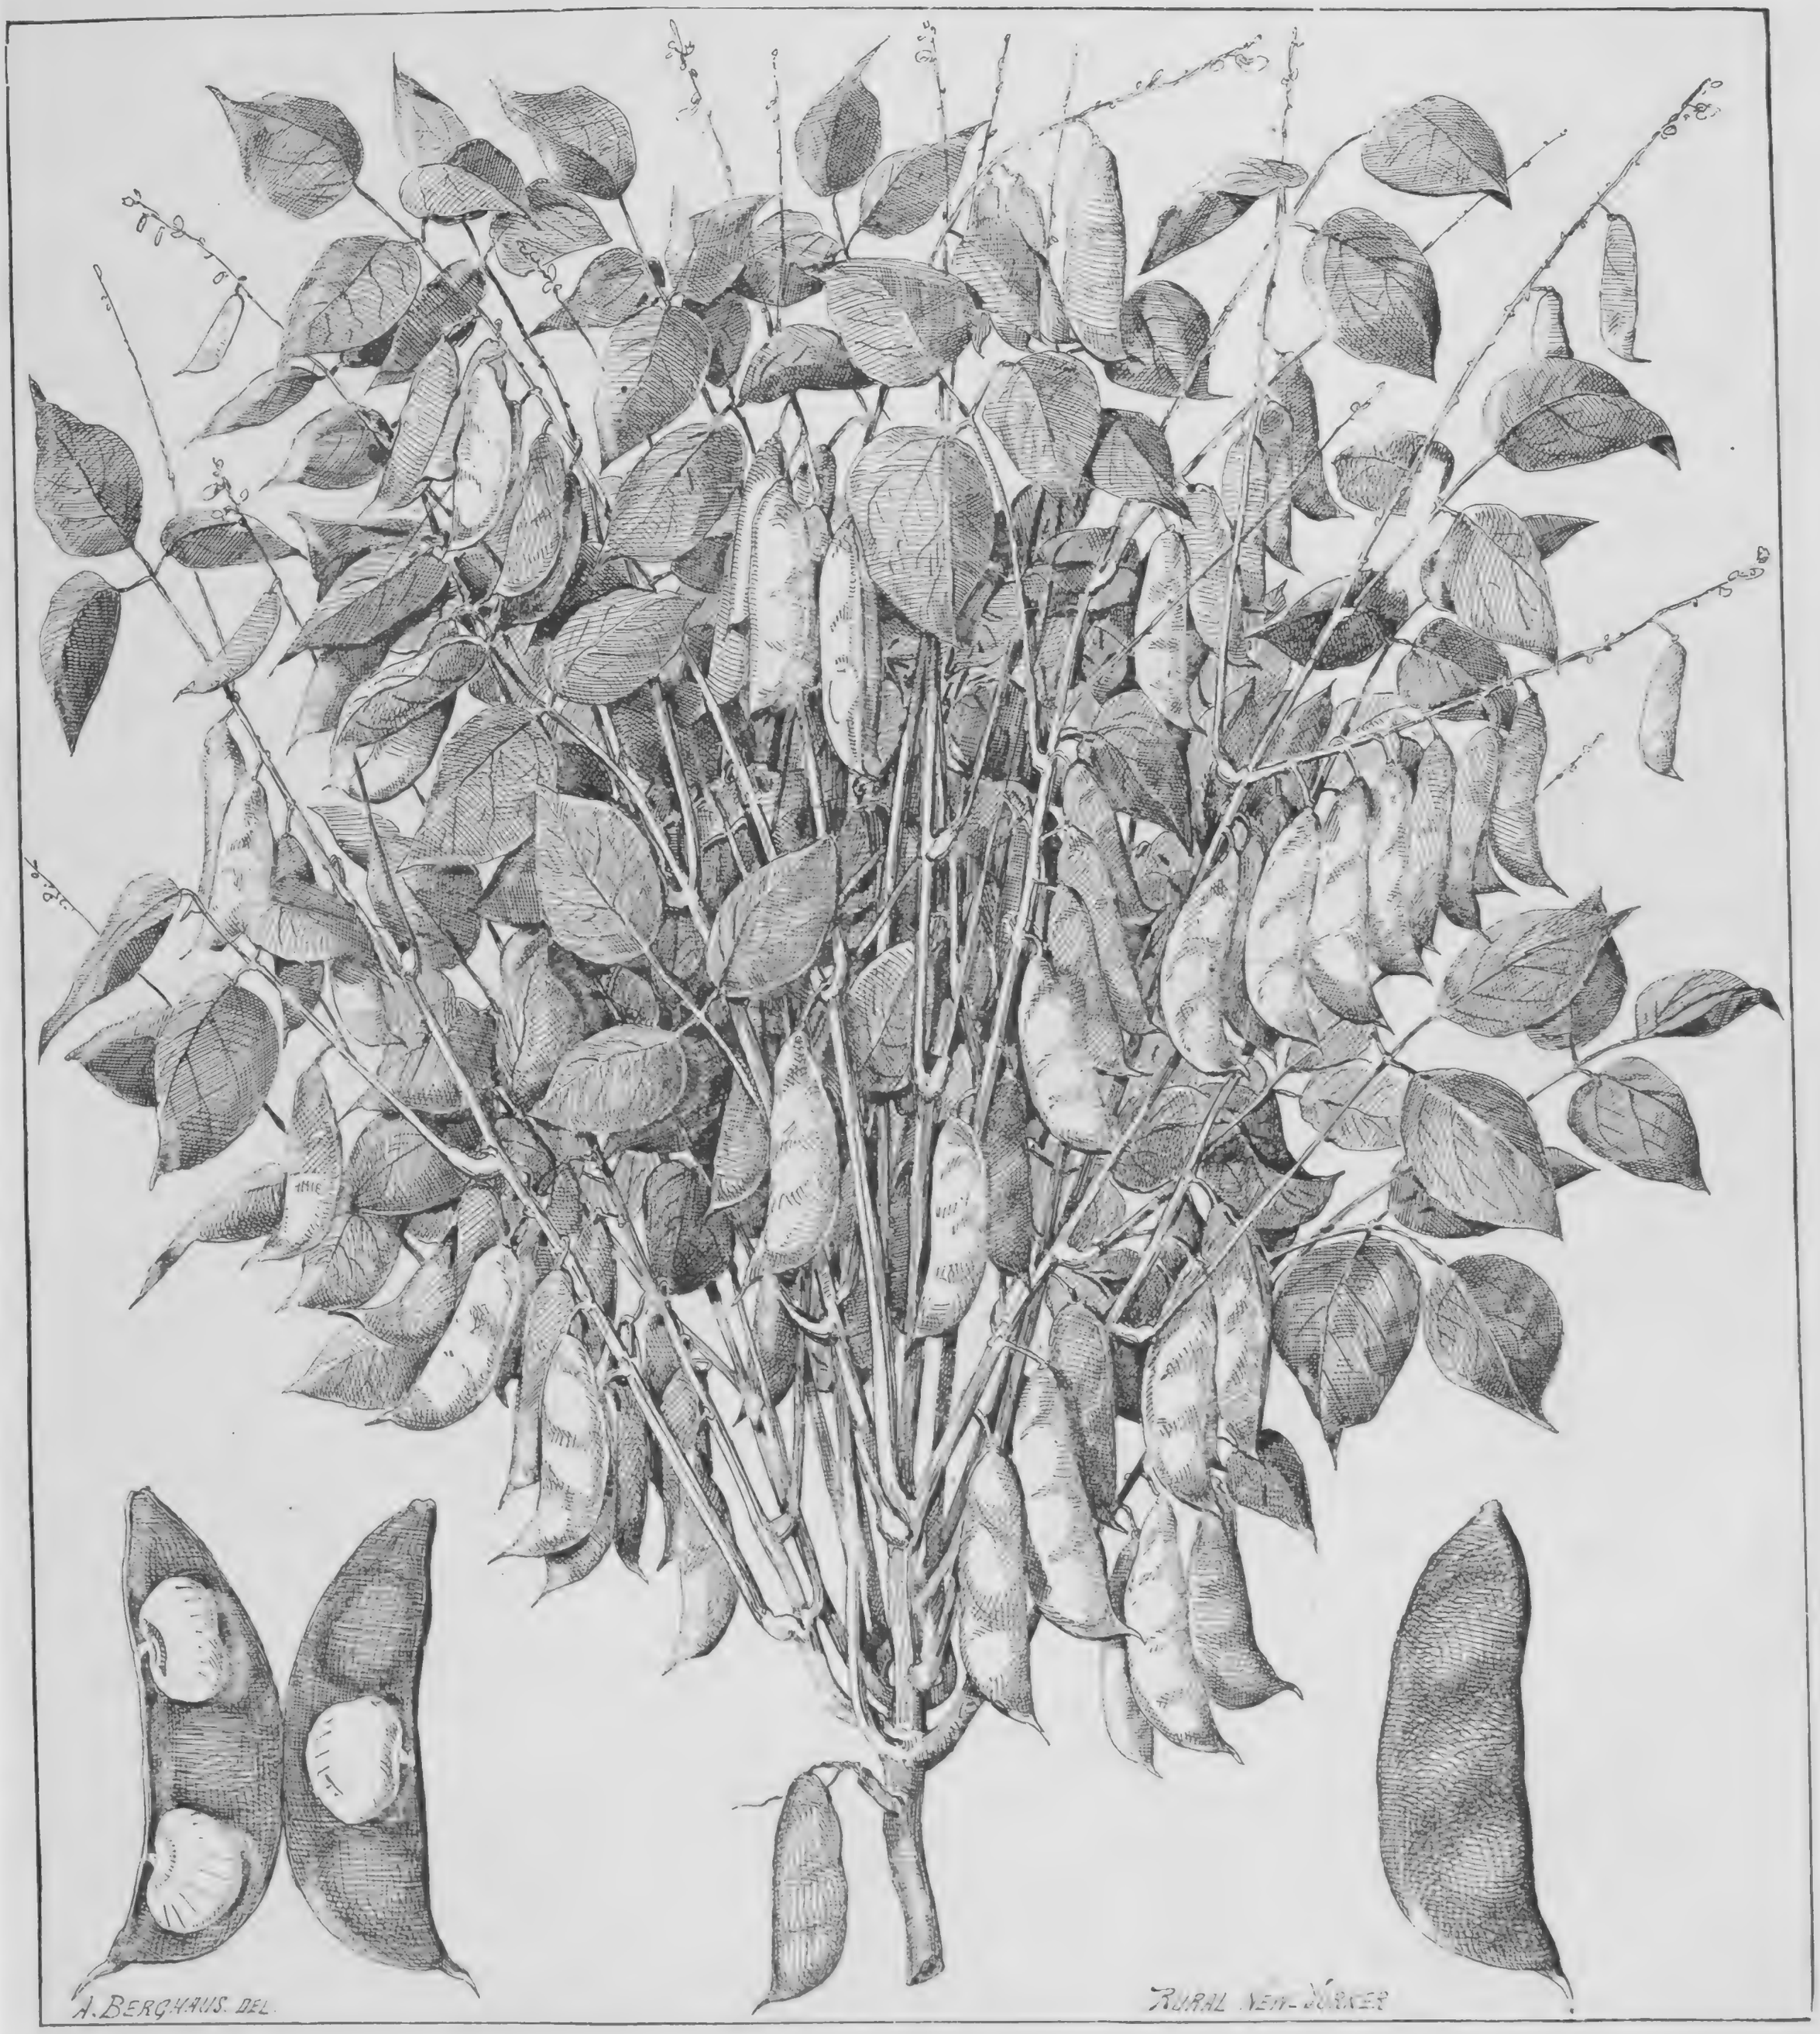
HOW can the best quality and greatest quantity of beans be produced at the least cost? My preference for general use is decidedly in favor of the dwarf or bush varieties, because they can be produced at least expense. Of course the desire to have a variety has much to do with one's preference. For instance, if the Lima be desired, there is no alternative—poles must be used. The bush Lima, (Henderson's) is a Lima only in name and botanical classification—a pseudo-Lima. As for the flavor that we expect in the Lima, it does not possess it. While it is very prolific, and of fair quality, it is late, and wanting in that



THE BATTLE OF THE BEANS. FIG. 257.

delicious, nutty flavor and richness that has made the Lima so noted. [Mr. Allen is mistaken. It is at least 10 days earlier

than the pole Lima. Eds.] The best comparison between the two classes is to be found in the well-known Horticultural, or Speckled Cranberry. Of this kind there are both pole and dwarf varieties. Of the latter there are several forms, differing considerably in quantity. As an illustration, take a plot of ground 20 feet square and fill it with the dwarf variety; plant in succession, say, at four different times, the first as early as it will answer; then at intervals of about three weeks, and there will be an abundant supply for a family of eight persons, both of snap and shelled beans the entire season. If the pole variety were planted, but one crop would be secured, and that not more than half the quantity that would be yielded by the former class, while the expense for poles and the trouble of setting them make the cost of growing the latter more than double that of growing the bush sorts. As a rule, the bush varieties are much the earlier, and I have seen two crops of many varieties grown the same season; that is, a variety was planted at the usual time, and in July it ripened its seed, which was gathered, sown and produced a crop of snap-beans in early October. I prefer the dwarf varieties mainly because they can be better produced in succession, yield better, and can be produced at less cost than the others. As for quality, the only pole bean I know that is equal to the Dwarf Horticultural, is the pole Lima, for which there is no substitute. The flavor of the Horticultural, both as a snap and shelled bean, comes next. It is better than the bush or dwarf Lima and equally productive; hence my choice.



HENDERSON'S DWARF LIMA. From Nature. The Open Pod Shows the Natural Size. Fig. 258.

THE ORIGIN OF HENDERSON'S DWARF LIMA.

In regard to the Bush Lima Bean we

(*Continued on Page 697.*)

Everywhere.

THE CLOVER SEED CROP.

REPORTS OF OTHER CROPS.

Illinois.

Woosung, Ogle County, September 28.—he present indications for clover seed, as compared with previous years, are far above the average, the acreage being exceedingly large. As the past two weeks have been generally favorable, the process of hulling has made fair progress. Seed has been yielding from 1½ to three bushels per acre. Quality good. Our other staple crops (corn, oats and rye) have also yielded above the average. The acreage of corn and oats is above the average, while the acreage of rye is somewhat below. Oats are yielding from 40 to 60 bushels per acre: quality rather light. Rye yielded from 20 to 30 bushels per acre; quality fair. With the exceptions of a few late-planted fields, corn was not injured by recent frosts. It promises to be good both in quantity and quality. R. W. G.

Dixon, Lee County, September 28.—The crop of clover seed is the best I ever saw. The hulling season has commenced; 16 machines are running. The manufacturers can't supply them fast enough. The Birdsell Huller is most in demand. In one day and a-half a machine hulled 97 bushels on my farm from 26 acres; I have 10 acres more to hull. We hulled 40 bushels in five hours on September 27. The seed is of very good quality. As nearly as I can learn about 16 counties in Northern Illinois have had a good crop. The dry weather was in its favor. Prices are very low; $3.50 to $3.75 per bushel. I understand that clover is good

in parts of Kansas. As to wheat, the yield was poor—from six to 14 bushels per acre, averaging nine bushels. It is selling for 70 cents. Oats were a very good crop, averaging 50 bushels per acre. Price 16 cents per bushel. Rye was a poor crop, averaging 14 bushels per acre; quality poor. Price 37 cents Corn is king. Early-planted is pretty good; late-planted was hurt by our August drought, and the frosts on September 2 and 19. Price 28 cents. Potatoes have made a good yield and are of good quality and I have scarcely heard of any rot. Price 20 cents. The Anglo-Swiss Milk Condensing Factory at Dixon, has so far been quite satisfactory to farmers. September 8 was its first pay day. It has been running 60 days, with only one condenser; with 1,000 cows they have 12 of them and are still adding more buildings. J. W. D.

ALDEN, McHenry County, October 5.—There is a prospect of a fair yield of clover. Hulling has not commenced. This is the first crop in several years. Oats a good yield, but light. Barley very poor. Wheat a complete failure. Corn about the usual crop; a frost in the middle of September spoiled it for fodder. Hogs $3.50 100 pounds. A. M. L.

Indiana.

FORT WAYNE, Allen County, October 2.—Counting 100 as an average crop of clover seed, the present crop is 50:

		price	$3.50	to	$4.00	per	bushel.
Corn,	75,	"	.33	"	.38	"	"
Wheat,	100,	"	.75	"	.80	"	"
Oats,	100,	"	.20	"	.25	"	"
Potatoes,	100,	"	.25	"	.35	"	"
Apples,	80,	"	.25	"	.50	"	"

We had wet and cold weather from May 12 to June 15, by reason of which corn was injured very much on clay soil. My statement is for northeastern Indiana, and in the southern portion of the State corn is a full average. F. P. R.

LAGRANGE, Lagrange County, October 2.—Clover seed is reported by thrashers to be turning out very well—possibly 20 per cent. better than last year's crop; much of the crop is yet unthrashed. Wheat is turning out 25 per cent. better than it did last year, except in some fields that were sown late or poorly fitted. Farmers are about done seeding and wheat is looking fine. Corn promises a fair average yield and was fairly out of the way of the killing frost which we had here on September 21 and 22; but very little was cut up, so most of the fodder has been greatly damaged. Oats were a very large crop; much more than the usual acreage was sown and the yield has been all of 40 per cent. above the average. Potatoes also were above the average, about 30 per cent. and are very fine. Apples are below the average in yield; there are only a few peaches. Pears a large crop. Strawberries were a failure; other berries and fruits were large crops. Garden truck all very good except late stuff which has been cut short by the dry weather. C. M. G.

SOUTH WHITLEY, Whitley County, October 3.—The clover seed crop in this locality was exceedingly good in quantity and quality. Wheat is looking first-rate. Corn crop about an average. G. F. M.

GOSHEN, Elkhart County, October 2.—Clover has been damaged considerably by the weevil, but is an average crop. We have had abundant harvests of all staple crops. E. S.

SOUTH BEND, St. Joseph County, September 30.—Clover seed as compared with previous years, is more than an average crop Corn is good. Potatoes are better. Wheat which was sowed late does not look very well. J. E.

NORTH WEBSTER, Kosciusko County, September 30.—Clover seed is not half a crop compared with the yield in former years. Corn is a fair crop with some. It was caught by early frosts. Early-sown wheat is looking well and plenty of farmers are still sowing wheat on corn ground. Potatoes the best crop raised here for several years, and there is no rot. Oats good. All kinds of fruit ditto. J. W. R.

LIGONIER, Noble County, October 1.—Clover seed in this section is good. There is about the usual acreage; yield from two to four bushels per acre; quality first-rate, and the seed is nearly all hulled. Weather cool and dry. Corn not more than two-thirds of a crop on that account. Wheat seeding is still unfinished and what is up grows slowly and gives poor promise. A full acreage has been sown. Potatoes plentiful and of good quality, having been planted largely upon low ground on account of the lesson learned from former dry seasons. W. W. L.

HARLAN, Allen County, October 1.—Clover seed is not as well filled as it has been in some years; but the acreage is large so that the crop will be more than an average one in this county. Hay is a large crop. Potatoes a full crop. Oats a large one. Wheat an average one. Corn a half crop. Buckwheat poor except Japanese which is good. The weather has been very dry here ever since June. Some farmers have not sowed their wheat yet, and but little wheat that has been sown has come up yet. This report will answer for several counties hereabouts. S. M.

HAW PATCH, Lagrange County, October 1.—The season has been good, except that it has been rather dry for corn. Clover seed (Mammoth) four to seven bushels to the acre—an extra large yield. Medium Clover two to four bushels. Corn will average about 40 bushels. Wheat averages 24 bushels, and oats 40 bushels. F. C. L.

BOURBON, Marshall County, October 5.—The present crop of clover seed compared with those of former years, is very poor. Wheat above an average crop. Corn an average. Potatoes a large crop, bringing 25 cents per bushel. Wheat in the ground is looking fine. S. B. T.

COLUMBIA CITY, Whitley County.—The clover crop is an average of those of other years here. Wheat is not looking well; the weather is too dry. Corn is a fair crop; some is not matured yet on account of frost and dry weather. W. A. S.

Kansas.

VIDETTE, Shawnee County, September 30.—From June 17 up to date the rainfall has been 15⅛ inches, the greatest fall at any one time being 2⅞ inches; minimum one-eighth inch. Temperature: maximum 98; minimum 36 degrees, mean 66 degrees. This has been the coolest season in this locality during my observations, for 20 years. Wheat is thrashing 30 bushels per acre; quality fine. Oats were killed by rust. Corn is perfect where it was thoroughly cultivated and the ground was not too wet. Potatoes are rotting badly. Garden truck is fine. Chinch bugs have entirely disappeared. The acreage of wheat sown is larger than usual. Wheat is bringing 65 cents; oats, 15 cents; corn, 20 cents; potatoes, 40 cents per bushel. All kinds of fruit abundant. J. E. N.

Michigan.

FLINT, Genesee County, September 30.—Clover seed will be below the average, owing to the weather being so very dry; we have had no rain in two months. Wheat is very good, averaging about 18 bushels to the acre; but it is below the average in quality, being more or less shrunken. Oats about the same as wheat. Corn a light crop. Potatoes below the average, but of good quality; no rot. Apples below the average. A. G.

LANSING, Ingham County. September 30. From my observation, I judge that clover seed, as compared with last year, has a larger acreage and the crop is very much better: growth not large, but very well filled. The late cutting of hay prevented some pieces from filling well; but it is mostly well ripened and well filled. Early potatoes very fine and plentiful; late crop somewhat shortened by drought: very dry here, winter wheat will make no root or top, unless rains come soon; apples not plenty, selling at $1. 25 to $1.50; corn below an average and much fodder was frozen one week ago. Oats and hay very good indeed. Wheat very poor and badly shrunken owing to the "green aphis:" Pasturage very poor; in fact, there is none, and I am feeding my herd of 40 cows as regularly and as much as in midwinter. Even with this care they have shrunken in milk more than one-third. A. A. K.

FARMINGTON, Oakland County, September 27.—The acreage of clover seed is about 120 per cent. of an average, but the yield will be light. We have had no rain to speak of since July 3, and the heads are not well filled and many seeds are shrunken. Potatoes are a very poor crop—only 35 to 40 per cent. of an average. The excessive rain just at planting made a very poor stand, and kept many from cultivating till the ground was like a meadow. The same remarks are applicable to corn, which will be about 50 per cent. of an average crop. Oats were rusty and not very well filled, yielding from 22 to 30 bushels per acre. Wheat was the poorest I have ever seen. It nearly all would rank as "rejected" or "no grade." The Longberry Kentucky Red was the best variety grown on our heavy rolling land. I had 11 acres of it and sold the entire crop for seed at one dollar a bushel; it was the only good piece in our vicinity. There is a very large crop of apples in this and adjoining counties, and the price has ruled firm at from $1, early, to $1.75 to $2 a barrel. Most farmers have sold their crops to the many buyers from New York, Chicago and other places who have canvassed the county. W. B. G.

BIRMINGHAM, Oakland County, September 28.—There will be a light crop of clover seed as compared with the crops of the last and previous years. The corn crop is very light, not half of a full crop. Potatoes very light also. Wheat not as large a yield as last year. Grass light, also barley and peas. Oats good—better than last season. Peaches and grapes not half a crop. Pears and plums a fair average. Apples a fair average crop, which is a surprise to all, as this is our "off" year for apples. Small fruits not an average crop. All small fruits were injured by late spring frosts. No fall feed. The entire season has been cool and very dry since the middle of June. O. P.

ROLLIN, Lenawee County, October 3.—Clover seed appears to be a large yield, but fewer acres were grown, some having been cut for hay and some pastured. Corn 80 per cent. of an average crop, mostly mature; wheat 12 bushels to the acre; average 55 pounds to the bushel. Oats a fair crop. Buckwheat good. Potatoes fair; some are beginning to rot. Hay a large crop. Apples extra good in quantity and quality. J. O. B.

GRASS LAKE, Jackson County, October 3.—There will not be 10 per cent. of a full crop of clover seed. Apples a good crop, or 75 per cent. Corn, 80 per cent. Buckwheat a full crop. Potatoes 75 per cent. Wheat 50 per cent. Beans are good. Oats are two-thirds of an average crop. WM. H. C.

ALLEGAN, Allegan County, September 30.—The yield of clover seed will be, I think, three times greater than for the last four years. A prominent dealer here thinks the present crop the largest ever produced in this county. Corn two-thirds of a crop. Potatoes splendid in quality and quantity. New seedings of wheat about an average. Pastures ditto. Apple crop below an average. Peach crop nearly a failure this year. E. H.

PLAINWELL, Allegan County, September 28.—Clover above an average, but not much has been thrashed. Some yields are: 17 acres, 73 bushels; 14 acres, 50 bushels; 20 acres, 55 bushels. Corn half a crop. Wheat, oats and potatoes above an average. Apples below. Late frosts and cut-worms, dry weather in July and August, also cool weather in August cut the corn short. J. C.

CHINA, Manistee County, October 2.—The season is very dry: but crops are better than was expected in the spring. Wheat is generally good. Corn is somewhat late and frosted, but there is a good growth of fodder. Hay was very heavy and well secured in good order. Potatoes good. Oats ditto. Prices are generally low except for butter which is in demand at 20 cents cash for No. 1. Apples about an average crop and selling at $1 per barrel hand-picked. There will be very little late feed unless we get rain very soon. T. D. E.

COLDWATER, Branch County, October 7.—The prospects are a little better for clover seed than they have been for the last two years; but on the night of September 21 we had a very hard frost that lessened the yield on a good many pieces. Hay was an average crop, but could not be secured in good condition owing to the wet weather. Wheat was light and of poor quality, being badly shrunken (and in some cases musty) as compared with the crops for the last few years. Oats were a good crop. Potatoes will be more than an average for this section. Apples are a fair crop and are selling at remunerative prices, bringing at present $1.65 and $1.90 per barrel; but, as usual, the speculator has the lion's share, for a good many contracted their orchards at $1 and $1.25 per barrel early in the fall. A. J. P.

MAPLE RAPIDS, Gratiot County.—Oats and hay are good crops. Potatoes quite good. Corn not more than half a crop. Wheat went from 10 to 27 bushels to the acre, but some is badly shrunken. Clover seed is below the average. Wheat on summer-fallow looks well; but the weather is too dry for it to do well on stubble ground. It has never been so dry here at this time of the year. G. C.

Nebraska.

DAVENPORT, Thayer County, October 3.—The weather in this part of the State has been fair during the past month or six weeks. Thrashing is nearly all done. Small grains are of good quality and yield. Flax made from eight to 15 bushels per acre and sold at $1 per bushel right from the machine. Winter wheat made from 25 to 40 bushels per acre, and owing to our good wheat crop the acreage sown this fall has been trebled as compared with last year's area. The crop has been nearly all sowed, having been mostly put in with pressed drills, and is coming up nicely. A. M. M.

New York.

GENESEO, Livingston County, September 30.—In this section clover has been a heavy crop, and an unusual amount of second cutting has been secured. From my limited knowledge, I should judge there will be plenty of clover seed thrashed out. As regards other crops, oats have turned out more straw than grain, the yield of the latter ranging from 25 to 40 bushels per acre. Wheat a fair crop. Potatoes almost a failure owing to wet season and rot. Corn poor. This is a great section for beans grown on the Genesee flats. Owing to late floods, almost every one, excepting on uplands, had to plant his beans twice and some three times over. A considerable number, however, after losing their first planting did not attempt a second one. During the first flood I believe there were some 200 or 300 acres of beans on the flats under water. Frosts are holding off, so there will be more of a crop than there would otherwise have been, but it will be probably less than one-half the usual aggregate. A. M. W.

HONEOYE FALLS, Monroe County, September 28.—No clover seed is raised in this section. Hay very heavy. Wheat and barley good. Oats and beans light. Corn half a crop. Potatoes less than one-third and apples one-fourth of an average. J. L. P.

NUNDA, Livingston County, September 29.—Clover seed is a much better crop than last season. Wheat yielded well and is of good quality. Oats are an exceedingly large crop, one piece of my own giving 75 bushels to the acre. Barley a light crop. Hay abundant and of fine quality. Beans rather a small amount, owing to wet weather. Potatoes a fair crop. There is not much decay among them and they are likely to bring high prices. Fruit almost a total failure. J. M.

JOHNSON'S CREEK, Niagara County, September 30.—No clover seed is raised here, nor has been for several years, all having been destroyed by the weevil: it does not blossom. Potatoes a light crop—ruined by blight about August 20; not rotting much. Apples a failure, quality very poor; much injury was supposed to be done by the heavy frost of May 29. Corn a light crop, a large growth of stalks, but no ears. Wheat, barley and oats below an average. Grapes an entire failure. G. R.

MENDON CENTER, Monroe County, October 3.—No clover seed has been raised in this vicinity for several years. It does not fill, owing, it is supposed, to insects at the roots. New seeding is first-class. Fall feed fine. Early-sowed wheat is looking well. Potatoes are less than half a crop and rotted badly on heavy land. Corn is generally light though there are some very good pieces on dry, rich land. Apples scarce and of poor quality. Wheat a fair crop. Oats: straw heavy; yield light. Few fields go over 50 bushels to the acre. Hay a fair crop. G. L. Q.

GASPORT, Niagara County, September 30.—Small or Medium Clover seed is raised in this part of the county and a very little of the large and some Alsike seed. Last year quite a good deal of seed of all kinds of clover was raised. The weevil has worked in the clover heads very badly and clover has not had any bloom, and the bumble bees are disappearing. Our main crop here is fruit which is poor and farmers feel the want of money. A. J. S.

Ohio.

TIFFIN, Seneca County, September 30.—The seed of English Clover is a medium crop, and that of the common Red Clover is

a very poor one. There are thousands of acres in this county that will not be cut. The prospect for the clover crop this season had been, as to the stand, the best that I can recollect, but the clover mite or the clover weevil has eaten it. The wheat crop is quite fair in yield and quality. The oat crop is fair. Corn and potatoes are about half crops. The latter are scabby and worm-eaten. I will have to feed two-thirds of my crop to the hogs on account of being so badly worm-eaten. Fruits of all kinds are very scarce and very inferior in quality. P. H. B.

FOSTORIA, Seneca County, October 4.—Clover seed is very poor this year, for we had too much rain at the time of cutting. Other crops are first-class. Wheat is coming up nicely. Corn is not very heavy. Prices are low. Good Timothy hay $8. Clover $5. A. A.

FAYETTE, Fulton County, October 5.—Clover seed has not been all hulled yet, but it has been a big crop so far, big clover yielding eight or nine bushels to the acre. Wheat will be a slim crop next year, the soil being too dry for it to come up and too dry for many to plow. Potatoes are a big crop, yet in some places buyers are offering a big price for them to ship. Apples are as plentiful as usual and large quantities are being shipped. Corn won't be an average crop owing to the cold, wet weather after planting. Cabbages will be almost a failure: too dry for them to head. G. F.

MARSHALLVILLE, Wayne County, September 30.—In this section I think there will not be more than 10 per cent. of a full crop of clover seed. It has been destroyed by what is commonly called the clover-seed midge; three-fourths of it will not be cut. Wheat and hay were full crops; oats about 80 per cent. of a full crop; corn 60 per cent. It has been injured by the white grub in the worst way I ever saw. Potatoes 60 per cent. of a full crop; they have rotted considerably; apples and peaches 20 per cent. There was a large crop of berries. E. B. Z.

LYONS, Fulton County, September 28.—Clover seed is a good crop, worth $4 to $4.25 per bushel. T. R.

ASHLAND, Ashland County, Oct. 5.—Clover seed will be one-third of a crop in this county. "Big Clover" will be only a full half crop as compared with former years. The midge is the cause of the failure. Wheat is a full crop and of good quality. The RURAL'S Diehl-Mediterranean with me was good, yield being 30 bushels per acre of first-class milling wheat. A large area has been sown to wheat again. Oats were a full crop and of good quality. Potatoes will average about one-third of a crop compared with last year's yield; blight is the cause of the shortage. Apples scarce. Peaches were a fair crop of good quality. Garden truck abundant. D. S.

LODI, Medina County, September 30.—I do not think there is one-fourth of a crop of clover seed in this vicinity as compared with previous years. The only seed we have is from a few pieces that were cut and left as a mulch in the middle of May. On these the crop is good. Potatoes not more than half an average crop. Wheat was above the average and of very fine quality. Oats and corn are average crops. I. W.

EMERY, Fulton County, September 30.—Clover, both Mammoth and common Red, never yielded better. Wheat never looked worse; many have not sown on account of the dry weather. Corn and potatoes are immense crops. W. P.

Pennsylvania.

WILLIAMSPORT, Lycoming County, October 2.—Next to no clover seed is raised in this county; in fact, very little is produced in this section of our State. All our seed is shipped here by dealers. Our staple crops have suffered very much this season from too much rain. They looked very fine up to June 1st when we were visited by one of the most destructive floods ever known, which swept all our bottom farms and country. The writer owns a very fine bottom farm one mile from the city, but the crops were all destroyed by the flood. Outside of the flooded district crops are only fair—not up to the average. Corn does pretty well. Oats are light. Potatoes a poor crop and there is considerable complaint of rot. Buckwheat is good. Wheat was a medium crop. The hay crop was good where the flood did not hurt it too much. Apples are not plentiful. Seeding this season is a little backward, owing to wet weather. We have had too much rain for farmers to get along well with their work, especially harvesting buckwheat and digging potatoes. What wheat was sown about the first to the 15th of September looks fine. Much more buckwheat was sown in this valley this year than usual owing to so many crops being destroyed in June, and all or nearly all report a good yield. D. M. K.

SPRING MILLS, Centre County, October 1.—There is no clover seed whatever in this county. It was destroyed by the midge. Indeed there has been no clover-seed crop of any account for the last 10 years. All the seed sowed for the last five years has been shipped in from the West. Wheat was about one-third less than an average. We had too much wet weather, and a frost on the 29th of May did some damage. The corn crop is an average one in this section. Most of it is out of danger of frost. Most farmers will commence to husk and crib about the second week in October. The oat crop is large in quantity, but not good in quality for it is too light. It was killed by rust and smut; the season was too wet for it. The barley crop is good. Not very much was sown this season on account of failures during the last two years. The grass crop was heavier than it had been for many years; but we had a poor season for curing it. Hundreds of tons of hay were spoiled by rain in our county. If the crop had not been so heavy that farmers could make some after harvest, there would not be enough for feed next winter. The potato crop is not more than half an average. Rot is playing havoc with all that are raised. Some farmers have lost nearly all by rotting. A good many tubers are still in the ground as the owners think they will not rot in the ground, while some will not dig theirs as the crop wouldn't pay for the trouble and expense. The grain that was sown early this fall looks promising. We commence to sow the last week in August and sow till the last of September. Some have not finished yet, but it is too cold now to get a good set for the winter. R. D. M.

ELIZABETHTOWN, Lancaster County, October 5.—An unusually wet season has caused an extra rank growth of stalks and weeds. Corn is one of the best crops ever raised here and is selling at 40 cents per bushel out of the field. Seeding of grain is about finished. Wheat averages 20 bushels to the acre. It has fallen in price, in four weeks, from 82 to 78 cents per bushel. Tobacco, one of the main crops raised throughout this county, is an average crop. Creameries, first established 10 years ago here, have increased until one is to be found every few miles throughout the surrounding country, and they have raised the price of butter, which sells here at present at 25 cents per pound retail. Our farmers usually buy a large lot of cattle about this time, feeding them throughout the winter, thus making a large amount of manure, and bringing their farms up to a good standard. Very little corn, hay or straw is sold and spring finds our farmers with fat cattle often weighing 2,000 pounds apiece, which command an extra price in the New York markets. Several thousand are sent away every spring. Real estate is selling very slowly, and land has fallen fully one-third from its price eight years ago. The grape crop throughout this section was a failure this year owing to the continued wet weather; but many varieties stood the test very well, showing that some of the newer varieties will resist the effects of a wet season better than some of the older sorts. Concord was almost a total failure, while Pocklington, Woodruff Red, Elvira, Delaware and Amber Queen were perfection. I have tried Duchess a number of times, but will discard it entirely; I have barely been able to have a single sound bunch of grapes of this kind. Eaton promises to be one of the main grapes of the future, while Concord cannot be produced as good as it was 10 years ago. H. V. C.

MENNO, Mifflin County, October 3.—The indication for clover seed is poor. Very little will be cut; some have only one bushel to the acre. I don't think there will be more than enough for seed. Potatoes are rather a poor crop and are still rotting. Corn is good—a little over an average crop. Wheat will likely average 16 to 18 bushels per acre. Oats are an average crop. There are very few apples. The wheat that was sown first is doing as well as I have ever seen. People have finished seeding, with a few exceptions. The last sowing is not growing fast. D. A. H.

HARRISBURG, Dauphin County, October 1.—Clover seed is not usually raised here, as it pays better to pasture for milk for the local markets. All farm crops have been good in spite of an unusually wet season. Corn extra fine. Potatoes rotted more or less as the ground was low or high. Oats not well filled and partly damaged by rain. Prices of produce are tending upward: Potatoes, 60 cents; butter 22@25 cents; eggs, 23@25 cents at the market. J. L.

WAYNESBORO, Greene County, September 30.—Clover seed will not be half of an average crop in center and south Cumberland Valley. C. W. G.

MIDDLEBURGH, Synder County, September 30.—Taking 100 as a standard, clover seed will be about 10. The season was too wet, causing a rank growth of other grasses. A great deal of seed is raised in this section when the season is favorable; but there will hardly be enough for home use this year. Wheat is very good: about 94 or 96 per cent. of a full crop. It was harvested in good condition. Oats are about 60 per cent. of an average and are in bad shape; most of the crop was sprouted before sheltered, and the grain is damaged for seeding. Potatoes were a good crop, 100 per cent., till the blight or rot struck them; about 40 per cent. were saved. G. S. S.

GREENSBURGH, Greene County, September 30.—The indications for clover seed this year are much better than for two or three years past. We expect a full crop in this vicinity. Potatoes are a very poor crop. Wheat and oats are very good. Apples are a very short crop. Grapes also a very poor crop. Corn is a medium crop. J. M. L.

JAMESTOWN, Mercer County, September 30.—The Medium Clover seed crop is a complete failure in northwestern Pennsylvania this year, and was nearly so last owing to the midge. But very little Mammoth Clover is raised in this county. Wheat is more than an average crop. Oats about 25 per cent. above an average. Potatoes less than half the usual yield. Apples and peaches nearly a failure. L. A. Mc C.

CHAMBERSBURG, Franklin County, October 1.—Clover seed about an average. Potatoes about one-half an average on account of rotting badly. Corn 20 per cent. above the average crop. Wheat 10 per cent. above. Apples about one-quarter of an average crop. Oats about an average. Grass and hay 20 per cent. above the average. Small fruits were about an average. Some hogs are dying from cholera. T. G. Z.

LOUISTOWN, Mifflin County, October 1.—Clover seed will not be more than 40 per cent. of an average crop. Wheat looks good, an average acreage. Potatoes scarce, blight cut them short and rot destroyed whole crops. Corn good. Fruit scarce. V. D. S.

SANDY LAKE, Mercer County, October 3.—In this section clover seed is nearly a failure. As compared with other years, oats are lighter, wheat heavier, hay rather heavier; corn about half crop, many pieces being nearly destroyed by worms; potatoes half crop and rotting somewhat. A large per cent. are too small for market. Buckwheat lighter. A. M. C.

HUMMELSTOWN, Dauphin County, October 8.—The clover seed crop will be about half that of previous years. Wheat a full crop. Corn will be over an average. Oats two-thirds. Potatoes a full crop. F. C. C.

LIVERPOOL, Perry County, October 7.—Clover seed is a poor crop in this neighborhood on account of the extremely wet season. Hay and oats were exceedingly good crops. Wheat and corn were good. Potatoes were not an average crop; the mildew killed them before they matured. They are also rotting to a great extent. W. T. C.

Wisconsin.

MILWAUKEE, Milwaukee County, October 3.—The Rural New-Yorker No. 2 Potato I cut to eight single eyes; yield, eight pounds eight ounces; the heaviest weighs one ounce less than a pound. One hill had four small potatoes not marketable; the other six hills had two good-sized ones each, and one hill had three. The potato is admired by everybody. The most remarkable features to me are the very small number of flat eyes and its shape. Of course I cannot speak of their cooking qualities. Barley is a good crop; oats and rye average ones; corn below an average, but ripe. Potatoes are fair and of the best quality I ever had in the 39 years I am here. Empire State and White Elephant are one-third rotten. They are on low ground; the rest are free of rot. The Beauty of Hebron excels. R. B.

APPLETON, Outagamie County, October 1.—The season here has been favorable for most kinds of crops. Winter wheat was sown quite freely last fall and it is a good crop, yielding, in some fields, as high as 30 and 35 bushels to the acre. Spring wheat is a fair crop; so also are barley and rye. Oats were never better. On my farm we thrashed 1,000 bushels from 20 acres, and they will over-run 10 bushels in 100 by weight. As high as 80 bushels to the acre have been thrashed this year. It was thought that corn would be a poor crop, but the frost has held off and where the corn was well worked we shall have good, sound corn and a fair yield. Potatoes are good and there are no signs of rot. There is plenty of hay and other fodder for stock. We have had neither too much nor too little rain and sunshine. We have plenty of apples and grapes, and small fruits were plentiful in their season. A good many cows are kept here and cheese factories are numerous—four or five in every township. The factory in our neighborhood (Freedom) took first prize for Cheddar cheese at the Wisconsin State Fair this year. Some cattle are raised for the local butchers, and a few sheep are kept on almost every farm. I do not know how well farming pays with us, but I do know that our farmers live, and build good houses and large barns. Prices of farm produce are about as follows: wheat, 75 cents; oats, 20 cents; barley, 50 cents; rye, 50 cents; potatoes, 25 cents; cheese, seven to nine cents; butter, 20 cents now. We have had no serious freezing weather yet. E. N.

ANSWERS TO CORRESPONDENTS.

[Every query must be accompanied by the name and address of the writer to insure attention. Before asking a question, please see if it is not answered in our advertising columns. Ask only a few questions at one time. Put questions on a separate piece of paper.]

SUBSTITUTE FOR ROOTS FOR LAMBS, ETC.

D. C. A., Cattaraugus, N. Y.—1. Can I raise winter lambs without roots? 2. What is the best and cheapest method for getting rid of ticks?

ANS.—1. While roots are exceedingly useful for feeding sheep in the winter, they may be dispensed with by judiciously substituting other food, that has similar nutritious and alimentary properties. Roots are chiefly valuable for their succulence and laxative effect, thus helping in the digestion of other food. Silage has these same elements of value, and if by preparing hay and selecting grain wisely the quality of silage can be approached, its effects may be approximated very closely. Sweet clover hay cut and wetted and mixed with ground oats and linseed-cake meal, in due proportion, will afford a fair substitute for roots. For a ewe with a lamb three pounds of hay cut and wetted, and one pound of mixed ground oats and linseed meal in equal proportions, with a tea-spoonful of salt added, would make one day's ration. If any dry grain is given, let it be oats, or oats and peas together, and not corn. 2. To get rid of ticks use Thymo-cresol made by T. W. Lawford & Co., Baltimore, Md., and follow directions given on the packages.

FERTILIZER FOR APPLE TREES.

W. B. G., Farmington, Mich.—What kind of commercial fertilizer would be advisable for an apple orchard, and how much should be applied to each tree 25 years old?

ANS.—We should use raw bone, at the rate of 500 or 600 pounds to the acre, and unleached ashes all the way from 10 bushels to 40 bushels, according to the supply and price. In the absence of ashes, use muriate

Miscellaneous Advertising.

"Herbrand" Fifth Wheel for Buggies.

of potash at the rate of from 200 to 400 pounds to the acre.

WASPS.

C. R. W., Westfield, New Jersey.—Are hornets of any use to the farmer?

ANS.—All wasps (hornets) are useful. They kill and eat such insects as house flies, carrot slugs, coddling larvæ, etc. As wasps do no harm at all, not even stinging if not molested, there is no reason for killing them, unless their nests are so located that one cannot help disturbing the insects.

Miscellaneous.

J. P., Lima, Pa.—Is there any cheap and durable contrivance for protecting young plants from the sun?

ANS.—We do not know of any.

A. W. C., Basking Ridge, N. J.—Would the RURAL recommend the use of stable manure on a six-year-old peach orchard on which some peach fertilizer was applied last spring? I am thinking of applying about three bushels to each tree, spread broadcast, before winter, as far as the limbs reach. If the RURAL does not recommend stable manure, what fertilizer would it recommend? Wood ashes cannot be obtained in sufficient quantity.

ANS.—We should use muriate of potash and raw bone liberally instead of the manure. We speak not from experience, but according to the advice of those who have had experience.

Discussion.

SUGGESTED BY MR. TERRY'S TOOLS.

S. B. H., CRAWFORDSVILLE. IND.—The RURAL gives a fine display of Mr. Terry's farm tools, and no doubt this will have a stimulating effect on many farmers to provide themselves with more implements. It will not have much of an effect on me, for I feel the need and importance of an ample supply of implements on the farm. There is not a week during which I do not feel the need of more tools than I have. Tools are of great value on the farm as they afford a great deal of help. Many of the RURAL readers no doubt have had to shell, or help to shell the corn at night to be taken to the mill the next day or the next time a grist had to be taken there. The hard cobs were used to rub off the grains, or the spade was laid on the edge of the tub, and the sheller sat on that and rasped the corn off on the spade. Now we have the hand-power corn-sheller, and need not give ourselves any concern about preparing a grist of corn. If it has been forgotten until one is about to drive out of the yard, only a few minutes are needed to get the grist ready. Forty years ago one of the greatest of the minor chores on the farm was sausage-making, or rather the chopping of the meat on a heavy wooden block set on legs, the choppers moving around it. The work of cutting the sausage-meat from five or six hogs extended away into the night, and the floor was covered with a mass of grease around the block. Now with an American or Enterprise Meat-chopper, a boy 12 years old will do the work better and in less time than three men could do it 40 years ago.

Since the mowing machine has come into use a new terror awaits the boy who has to turn the grind-stone, and his work is so unsatisfactory that one wants a man to turn it; but it is hardly less tiresome to the man who holds the sickle than it is to the one who does the turning. When one gets towards the end, the weight of the sickle becomes very tiresome and the result is that the work is not as well done as it ought, and one does not do it as often as it should be done; then the sickle is continually choking; or one sees that the horses are worked too hard, the grinding of the sickle is the least of the evils that beset him, and he reluctantly goes to grinding again; or perhaps for the lack of a hand to help him to grind he keeps on mowing, worrying himself and exhausting his team. Now with a "New Dutton Grinder," one needs no one to help him. The little implement can be carried to the field and the sickle can be kept sharp while the horses are resting. The machine makes the same bevel on all the sections; while on the grind-stone that cannot be done, or if it can one is tempted to make a short bevel to get a sharp-cutting edge with as little grinding as he can get along with. The little machine does a good job from beginning to end, and with so much less worry and work that when its worth becomes generally known, it will go with every mower. These implements I have tested. There are a great many others just as useful in their way, which have been tested by others, who might help some of us by giving their experience with them through the RURAL NEW-YORKER.

DRESSED BEEF NOT FEARED HERE.

G. D., CARYSVILLE, OHIO.—No Chicago dressed beef is handled in this section now. Some parties made an attempt to handle it here some time ago, but the concern proved short-lived, having lasted only about eight weeks; then it collapsed for the want of patronage: people here did not care to use the beef. While the concern lasted it affected the local butchers to a great extent by the reduction of the retail prices of beef. It retailed its beef at about 1½ cent less per pound, on an average, than the prices at which the local butchers had been selling; but they followed suit and reduced their retail prices and sold their beef at figures for the Chicago dressed beef, and as people preferred home-slaughtered beef they purchased that—hence the concern collapsed. It certainly is a serious disadvantage to the farmers wherever the dressed beef is handled, and to the farmers throughout the country in general, for the local butchers in order to maintain their trade must meet the prices of the Chicago dressed beef, and therefore must either handle this beef or buy their stock at a much lower figure from the farmer, who would thereby be the loser.

I do not think, however, that the Chicago dressed beef trade is entirely responsible for the present depression in the prices of beef cattle. It is true that cattle can be slaughtered and dressed in large numbers in those large slaughter-houses where all the best appliances for such work are at hand, much cheaper than the work can be done by other parties with fewer and poorer conveniences and on a less extensive scale, and the cost of shipping the dressed beef to the place of consumption is certainly less than that of shipping the live animals and then slaughtering them and preparing them for market. It seems to me that the chief cause of the present depression in the prices of our cattle lies in the fact that cattle in vast numbers can be raised on our Western plains and grazing lands, with comparatively little trouble and expense. Beef cattle can be raised there and sent here to market for less than the raising of them here would cost us if we count our labor in the cost of production. It would therefore be folly for us to compete here with the stockmen of the Western plains in the production of beef cattle. It is from those Western sources chiefly that the members of the Chicago dressed beef syndicate procure their supply of cattle. They slaughter, dress, and ship the beef to the place of consumption at a minimum cost and sell it in our Eastern markets at a figure for which we could not possibly raise it ourselves and realize a fair profit.

AGAINST PLANTING TREES EARLY IN THE FALL.

C. K. M., PEKIN, ILL.—I notice in the RURAL NEW-YORKER of September 14th an article by Joseph Meehan on the early fall planting of deciduous trees. An article similar to this has been going the rounds of the agricultural papers for the last three or four years, which has no doubt caused an immense amount of loss both to nurserymen and planters. While Mr. Meehan's advice may be good for some localities, it is certainly very bad for this section where the conditions are different. If 100 fruit trees of ordinary varieties were taken up and transplanted according to Mr. Meehan's directions on September 14th in this locality, I am confident that not one would be found alive by spring. Actual tests made to-day (September 30) show the earth to be 30 degrees colder than the air—soil 54 degrees; air 84 degrees at noon—and this difference will continue, with some variations, all through October. This is not a matter of conjecture, but something I and others have tested to our sorrow. In the autumn of 1886 I bought eight apple trees from an agent to fill out vacancies in my orchard; a neighbor also bought eight for the same purpose and another neighbor bought 26. The trees came to hand early in October; the leaves had been stripped off by hand, but the trees were thrifty and well rooted. They were planted as soon as received and the weather following was as usual—clear and warm with drying winds during the day and cold frosty nights. The following spring my trees were all dead except two of the Wealthy variety; while my neighbors lost every one of theirs. The same agent sold over $1,000 worth of stock in this locality, all of which, so far as I have heard, went the same way. Apple trees of my own growing which were planted in the latter part of November after the leaves had fallen, all lived and did well. When those planted early were taken up in spring the roots were alive, but had formed no fibers nor had they even callused where they had been cut off. Only last spring one of my neighbors told me of the loss of $18 worth of stock planted in the fall of 1888, and this is but one out of hundreds of cases, all the losses arising from planting too early, before the trees had matured their growth.

ELECTRICITY SUPPLANTING HORSES.

J. A. F., TERRE HAUTE, IND.—If in the article in a late RURAL in regard to electric railways and the throwing on the market of so many horses, and the prospective cutting off of the demand for them for street cars, the total number of horses in the United States had been stated, it would be at once seen that there were no grounds for alarm. The statement was that the horses used in 1880 on street railways in the larger cities numbered about 80,000 and that the smaller cities might increase the number 20 per cent., making about 100,000 in all. Well, according to the census of 1880, the total number of horses and mules then in the country was 12,270,296, so that if all the horses and mules in use on street railways were dispensed with, it would be a loss of less than one per cent. If we take into consideration that the change will be gradual it can be seen that the effect on the market will be exceedingly small. That the throwing out of use of these horses for street-car purposes will have no serious effect, can be clearly shown by the following calculation: Supposing that the mortality of horses, which doubtless varies a little, should increase by just one death yearly in each township in the United States, would the consequent loss be perceptible? Well, if every horse now employed on street railways should be displaced in five years from this date, it would have less effect than the increased mortality mentioned. The horses employed being 100,000, the displacement in each of the five years would be 20,000. There are 2,690 counties in the United States, and supposing the counties averaged 10 townships each, it will be seen that the increased mortality would be 26,090 or 6,090 above the loss from the street-cars. The yearly mortality among 12,000,000 horses cannot well be less than one million and the addition of 20,000 to this could make no noticeable difference. The calculation shows what a great country we live in. Reference was made to the number of men that would be thrown out of employment. A similar calculation in regard to them would show similar results.

PLAN OF BUILDING.

C. T. SWEET, SWANTON, MD.—In the RURAL of September 7, page 591, I gave a short account of a house which I thought would prove cheap and comfortable for farmers. The following letter from a man in Pennsylvania is a sample of several I have received.

"In the RURAL NEW-YORKER of September 7, is a plan of a farm house which I like very much. Can you furnish detailed working plans and lumber bill for the same, and if so, at what price? For my own use I should have a cellar under only half of the building (the kitchen side), as I propose having a small ice-house with a milk-room, etc., convenient to the kitchen. I think I should have the house warmed with a hot-water heater; but, of course, I would want the necessary chimneys. There should be tanks in the attic, of course, to furnish water for the range and heater. It should be plainly finished and there should be no 'gimcracks,' for I would want to keep the cost down as near to $1,000 as possible for building."

I am not an architect, but a machinist. My plan was to secure several parties to cooperate with me in getting plans and specifications from some reliable architect for such a house as I indicated. Where several parties would share the cost of such plans the expense to each one would be very light. It would be a bit of practical cooperation that might prove useful and economical to those who want such a house.

R. N.-Y. If any of our readers want to secure plans on this basis they can communicate with Mr. Sweet or with the R. N.-Y., as they prefer.

EXHAUSTION FROM MOULTING.

P. H. J., HAMMONTON, N. J.—In the RURAL of September 28, I find the following item:

"Here is a note about hens with clipped wings: 'White Leghorns with clipped wings are apt at moulting to droop and appear sick. The quills in the clipped wings are not shed as quickly as those in the other wing, and require to be gently extracted. At least this is the observation of a Jersey-woman.'

Have any of our readers noticed this?

EDS."

The lady has evidently attributed the drooping to clipping the wings when it is really due to general debility from moulting. Whether the wing feathers are clipped or not, they will be dropped only when the proper stage of progress arrives. It is beneficial sometimes to pull out nearly all the feathers. Moulting is a trying ordeal with some hens; but the majority of the losses occur from failure to feed food rich in nitrogen, as the rapid growth of new feathers demands nearly all the elements that enter into the composition of flesh and bone. Moulting is more trying with Leghorns than with Asiatics. One of the foods for moulting hens is half a table-spoonful of linseed meal, three times a week, in the soft food.

DRESSED BEEF.

L. F. ALLEN, BUFFALO, N. Y.—The Chicago dressed beef trade has not yet been sufficiently developed for me to give an opinon on its advantage or disadvantage to the people where the meat is sold. Our local butchers are opposed to the business on the ground that it is cutting off the supply of beef cattle from the neighboring farmers who formerly supplied them. If continued by the Chicago men, it will be a damage to our farmers who breed good beef cattle. Besides that, the dressed beef may be more or less diseased without the consumers being able to discover it while purchasing. As a rule, I am opposed to it; but without further experience I cannot give a definite or conclusive opinion.

THE TAYLOR BLACKBERRY.

D. L. B., NUNDA, N. Y.—In a late R. N.-Y., in speaking of different varieties of blackberries, I think the Taylor does not get the credit it deserves. It is spoken of as rather small for market; while with me it is nearly as large as the Kittatinny and of much better quality, besides being at least one-third more prolific. It is also hardy—much more so than the Kittatinny growing beside it, and is free from rust. I think so highly of it that I have set out a new patch this year and discarded the Kittatinny. I have tried the Early Harvest and Snyder and discarded them as worthless here.

E. C. B., MIDDLETOWN, PA.—The past season has brought me a bit of experience that I am not able to understand. Perhaps the RURAL NEW-YORKER or some of its able correspondents may help me out. It is as follows: My Sharpless Strawberries produced berries of a different type. In form they were like the Charles Downing, but larger, and the seeds were more prominent. They were also a little earlier than the Downing, and four to six days earlier than the Sharpless. Their flavor differed from that of any variety I know; but resembled that of the Sharpless more nearly than any other. In some spots they were abundant; in others there were only a few; while in some places there were none. The beds of the first and second crops were the same in this respect. Nothing strange was noticed I believe or at least only a trifle in the two-year-old bed a year ago. In the same field alongside of these berries were Manchester, Crescent, May King, Cumberland, Jessie, Bubach, etc. I am at a loss to know if they had become "mixed," or if hybridization in fruit could have taken place. I never discovered any difference in the foliage.

R. N.-Y. We should say they are mixed kinds.

A. M. LAGRANGE, ALBANY COUNTY, N. Y.—The following is a copy of the label that I put on every bale of my hay. This is one of the ways in which I try to "make farming pay."

"This hay was raised on upland, chestnut timber soil; gravel, sand-loam and clay-loam land. The chaff is taken out as much as possible. Produced by A. M. LaGrange."

What Others Say.

THE HICKORY, says Prof. Sargent in Gar-

den and Forest, is purely an American tree. The eight species which are known all belong to the southern half of the North American continent, with the headquarters of the genus, as represented by the greatest number of species in any one locality, in the valley of the Red River, in Arkansas, with one species pushing far south along the Mexican Sierra Madre. No other country or region of the earth can boast of an indigenous hickory-tree, although it is quite within the bounds of possibility that one, and perhaps several species may still be found in the unexplored mountain districts of Central China.

There is no wood at once so tough and strong and true. It is the hickory-wood in its handle which has carried the American axe round the world, driving, wherever it is known, all other axes out of the maket; and it has made possible those light carriages, which in turn have made possible the American trotting horse, one of the marvels of these modern times, and probably the best example of what can be accomplished, by careful breeding and persistent selection, in the development of domestic animals for a special purpose. No other tree is known whose wood is tough enough and strong enough to stand the strain imposed upon the American trotting-sulky and without the modern sulky and its heavier forerunner, neither breeding nor training could have produced that race of horses which many Americans look upon with joy and admiration.

The area of the region in which the hickory grows to perfection is really small in comparison with the demand for it; and when no substitute can be found for a particular wood it must in time be exterminated however abundant the natural supply, unless measures are taken to increase and perpetuate it artificially. And it would appear that of all our trees the hickory is the one which should be planted wherever suitable land can be spared for it; and it should be protected and cherished, in view of the ever-increasing demands the world is making and must continue to make on this tree

SPIRIT OF THE PRESS.

PROF. SANBORN, as he expresses himself in the American Agriculturist, does not believe in seeds running out. If the conditions surrounding seeds grow more unfavorable, the crop will decrease and the seeds will give evidence of decreasing vitality. If the conditions grow more favorable one may look for the seed to increase in potency and yield. The change in the locality of a seed must be, so far as climate is concerned, from the less to the more favorable climate and never the reverse. In the one case improvement will occur, and in the other the reverse. Likewise, the oft-repeated advice to change seed with our neighbors will hinge on the same principles before enunciated. Change of seed of the same variety from farm to farm will work well for one party to the exchange, and poorly for the other. Prof. Sanborn would expect to receive advantage by sowing a wheat grown on a farm richer than his own, and where the wheat actually yielded more than that of his own farm, on the same principle that a breed of steers bred or fed into greater productiveness, like the Short-horn over the scrub, would have greater powers of growth. On the other hand, if he took wheat from a poor farm where it had been fed down to a low limit of yield, he would expect, like a stunted race of men, this effect to be for a while manifest.....

DR. HEATH affirms, in our neighbor above quoted, that potatoes fertilized by sea-weed produce a large crop of tubers free from grub-eaten spots. The sea-weed is rich in protein, containing from 20 to 25 per cent. It is from this fact that pigs and fowls greedily devour fresh sea-weed, and especially the rock-weed in it, which is very rich in protein.....

DR. HEATH says that if the farmers generally of the south side of Long Island knew the remarkable fertilizing properties of sea-weed, as do most of the European seaside farmers, they would save half of the expense they now are compelled to incur for manures. A load of sea-weed is worth as much as a load of New York manure, and it is conceded that New York City manure is super-excellent, because of the high feeding of city horses.....

GLADIOLI blooming at this late date are as rare as they are beautiful. The R. N.-Y., taking Mr. C. L. Allen's advice, made its last planting two weeks later than usual and the reward is a charming display now when nearly every sort of flower has bloomed and passed away.....

LAST YEAR a correspondent of Green's Fruit Grower gathered a lot of dry maple leaves, put a few in the bottom of barrels, then a layer of apples, and then a layer of leaves, and so on until the barrels were full. He then covered them with leaves and they kept nicely and were sold in the spring for $2.50 per barrel, while he could get but $1 in the fall. He sold some in May to a dealer and he helped pick them over. The dealer said he never saw apples keep so well in his life. Some of the barrels didn't have a dozen specked apples.....

WILLIAM FALCONER tells the American Florist of a new chrysanthemum, soon to be introduced, of the style of the celebrated Mrs. Alpheus Hardy, except that it is pink instead of white. It comes from Japan and is in the hands of Peter Henderson & Co...

ACCORDING to the London Garden a double Lilium auratum has been sent to England from Japan.....

A "BULLY" ARRANGEMENT.—John M. Eddy, of Saratoga Springs, N. Y., the New England Homestead says, has a method of breaking bulls that is both practical and economical. He takes the animal at any age and puts on the same harness that he would use on a horse, turning the collar the opposite side up, and hitches him into a two-wheeled cart in some large field where there are no trees. He then gets in for a ride, letting Mr. Bull go where he wants to. When the bull begins to tire he continues to drive him until he is thoroughly conquered. After the first trial he has no difficulty in working him. But he always keeps a rope attached to the ring in the nose so that the animal cannot run away. Mr. Eddy has a four-year-old Holstein bull that has drawn all the manure on the farm the last year, and now does all the work, such as drawing corn-fodder for 21 cows every day and earth for the stable. He says that considerable care should be taken not to overload the animal for the first few weeks, for if once balky he will make trouble.....

COLMAN'S RURAL WORLD shows a disposition to be very fair in its consideration of Montana. It says that there may be a spell or two of very severe cold weather during the winter, but those who live there say the air is so dry they do not feel the cold weather as much as they do elsewhere when the thermometer is at zero. It concludes its remarks as follows: "It is only those who want homes and who are not able to buy them that should go. Every citizen is entitled to 160 acres by simply settling upon it and complying with the Homestead Laws."....

TO BE in debt is to be in danger, says a thoughtful editorial in the Times, and as life is uncertain and a mortgaged farm is a poor inheritance for one's family in case of death, every mortgage should be secured by a life insurance for an equal amount, so that in case of death the debt could be paid off. This security is as indispensable as a fire insurance and quite as cheap, and if it is once provided for it would almost certainly be secured for life, affording a safety fund which would make unnecessary that close economy needed to lay up savings as a provision for the future which cramps the family and stints them of many enjoyments which go to make farm life pleasant and profitable.....

WHAT is the comparison between a pair of horses that will draw a plow at the rate of two miles an hour and another that will do the same work at four miles? Henry Stewart argues that to plow an acre is worth at least $2. The plowing of 40 acres is worth $80. The slow team earns $40 while the fast team earns $80. This difference is equal to the interest on $800 at five per cent. So that the farmer who keeps a slow team might profitably pay $400 for a fast-walking pair of horses more than the ordinary market value of the horses, or $600 or $800 for the better animals and yet make a profit.....

MR. HENRY M. FLAGLER, the Secretary of the great Standard Oil Trust, says of himself, according to Harper's Weekly, that he made his start by the exercise of the most rigid self-denial, and that he was distinctly a mean man until he had made his first million. A man, he says, ought to be stingy until he has accumulated money, in order to be able afterward to be as generous as he likes.....

JACOB BIGGLE says, in the Farm Journal, that he has observed that a place kept in nice order will sell for a greater price than one allowed to run down. One hundred dollars a year for ten years spent in keeping things fixed up, will add more than one thousand dollars to the price of a farm that is offered in the market for sale; and more than this if taste and skill be brought to bear in the adornment of buildings and door-yard. Fifty dollars invested in beautiful trees and shrubs for the lawn may add several hundred to the value of the farm. He has seen such results brought about many times, and in his own experience he does not need to regret the money spent in this way.....

IT is well to remind our readers that rhubarb may still be planted. Cover over the sets with straw or leaves until early spring. Six plants in good soil will supply a family of six.....

MAGNOLIA CORDATA has given an abundant bloom this fall. During early September more flowers were borne than in June. The tree is 20 feet high and 14 years old from the nursery. It bears fruit very sparingly.

ONE of the showiest trees at this time is the Umbrella Magnolia. It bears its rose-colored oblong fruit in abundance, while its great leaves are among the last to wither and fall from the effects of frost.....

WORD FOR WORD.

——HOARD'S DAIRYMAN: "The good lady who made the premium butter of 50 years ago, who raised the cream in six-quart pans, who skimmed the cream from sour milk, who guessed at the temperature and the salt, who churned in the good old way, is still on deck and is making good butter and taking premiums at the present day, *when the conditions favor her.*"

——"HAVE we not often noticed at dairy fairs that Mrs. Smith, who was awarded the first prize for butter, when called upon to describe her mode of manufacture, has astonished all the best butter-makers and caused them to wonder how it was possible for any one to follow the rules given and produce a fine article of butter?"

——WE need not hunt very long for the key to the situation. A uniform quality and maximum quantity, require uniform conditions. What will make good butter to-day will do it to-morrow, and every day in the year."

——NEW ENGLAND HOMESTEAD: "The credit system causes the financial death of thousands of farmers. In no line of business is it abused to a greater extent than in the fertilizer trade. The manufacture and sale of fertilizers is a business requiring immense capital, especially where sales are made on credit and consumers have to bear the burden of this credit. The Homestead contends that in the purchase of fertilizers, and, indeed, of farm implements and supplies generally, it is cheaper for farmers to borrow money on their notes or mortgages and buy for cash than to pay long prices for goods bought on credit. In the latter case they have to pay from 10 to 40 per cent. interest on the money which represents the real cash value of the goods purchased. But where they pay cash, even if they use borrowed money to do it with, the expense is only from five to 10 per cent. according to charges for money in various sections of the country."

——GOODALL'S SUN:

LITTLE MORE SIDE HER.

"A fellow gathered apples
One September afternoon,
And thinking of his loved one, said:—
'I may be side her soon.'

But the apples might have answered.
'Don't you brag so, like a loon,
We're as good as any lover:
For we may be cider soon.'"

——WASHINGTON CAPITAL: "When it comes to cutting down cabbage the cook's word is slaw."

——DETROIT COMMERCIAL:

"If a stranger comes among you,
And you find him kind and true,
Why not mention it to others?
They may learn to like him too."

——FARM JOURNAL: "Sheaf oats, cut short and made into a 'cut feed,' with one quart of rye meal and two quarts of bran, make a splendid feed for the average farm horse."

——"It is hard on a cow's nerves to keep her brush still while being milked and the flies and mosquitoes are bad. Can you keep right on milking if two or three mosquitoes are singing in your face?"

——LONDON LIVE-STOCK JOURNAL: "The conversion of old horses into extract of meat need not have created such a very great sensation as it did when it came out in a case brought up by the Society for the Prevention of Cruelty to Animals. The process, says a correspondent, has been carried on for a long time in many ways. In the days before the Margarine Act, many a one had his breakfast toast buttered with prime 'Dorset' churned from the bones of some old horse that may have dragged him to business many a time, and yet he never thought anything about it. Horses are too good to go to the dogs nowadays, at least too profitable. Barrels of horse-grease are frequently shipped from this country to Germany."

"'ALMOST persuaded' harvest is past!
'Almost persuaded,' doom comes at last
'Almost' can not avail
'Almost' is but to fail!
Sad, sad, that bitter wail—
'Almost—*but lost!*'"

——INDUSTRIALIST: "'BOOM' IS DYING.—In the majority of cases 'boom' has proved disastrous, and has earned for itself a definition by which it might properly be regarded as a contraction or corruption of boomerang. Certain it is that the term possesses the chief characteristic of that instrument. Lexicographers of the future will define 'boom' as an abnormal, unhealthful growth, which, on subsiding or disappearing, leaves the object of its attack in a paralytic state. 'Boom' is distasteful, obnoxious."

——DAVID DUDLEY FIELD: "It takes longer and it is harder to punish a criminal in this country than in any other civilized country in the world."

SATURDAY, OCTOBER 19, 1889.

THREE DWARF LIMAS.

"I'LL give two thousand dollars," said Peter Henderson a year ago, "for a prolific bush Lima that shall bear beans (pods and seeds) as large as those of the pole Lima." It occurred to the writer that he would make successive plantings of the Henderson's Dwarf Sieva and cross them with pole Limas. This was done, but it was found impossible to effect a cross, simply because the pistils were so tightly coiled and surrounded by the stamems as to make separation impossible until too late—that is, until the pollen of the anthers was mature. Strangely enough, at this very time, the Kumerle, a dwarf Dreer's Lima, was being offered for sale, while a little later a dwarf large Lima was announced. True it is that successes, like misfortunes, "never come singly."

"THREE blind mice,
Three blind mice;
See how they run,
See how they run."
etc, etc.

The head-lines on the first page, "Three Lima Beans," etc, will be seen to be a parody on the above well-known "round" song.

THE last planting of our Kumerle Dwarf Lima is now, after two or three frosts, well filled with beans. The pods are large and well filled. The objection made to the new dwarf Limas—that the beans rest on the ground and are covered with soil—does not amount to much. What is the objection to throwing them into a pail or tub of water?

CONSIDERABLE space is given this week to a consideration of bush and pole beans in general and of pole and dwarf Limas in particular. The R. N.-Y. has not tried Burpee's Dwarf Lima, as it is not as yet in the market. But we have tried both Henderson's and Kumerle's. Our opinion is that these beans have come to stay. The Henderson will be valuable for its earliness—the Kumerle as a dwarf Dreer's Lima, and the Burpee for a Large Dwarf Lima. Thousands of people, those especially who have a limited garden area, do not raise pole Limas because of the trouble and expense of procuring and setting the poles. These dwarf varieties require no more space than any of the bush beans, while the pole botheration is entirely avoided.

A COMPANY with a capital of $300,000, has been organized to build an extensive new stock-yard at Philadelphia. Its promoters are Western men who wish to ship cattle on the hoof to that point and there dress the meat wholly for export, working up all the "waste" products, on the spot, into glue, tallow, bone-black and fertilizing material. It is claimed that the beef killed at the seaboard for shipment abroad will be given preference in foreign markets over Western dressed beef as fresher and more wholesome, and that the company has made very favorable terms with the Baltimore and Ohio Railroad to enable it to compete with the Chicago and Kansas City syndicates. If the meat be all exported, the new enterprise will not have much effect on the prices of Eastern stock; while, as a competitor with the Big Four, it will have a tendency to raise the price of cattle in those sections of the West—chiefly Colorado—from which it will obtain its supplies.

ONE of the largest loan and trust companies doing business in Kansas has collapsed, and another has decided to go into the hands of a receiver and stop business. Both made loans chiefly on farm mortgages, using Eastern capital, and the headquarters of both are in Boston. The business of late has been a losing one. The Western agents looked more carefully to their own interests than to those of their distant employers They made loans very recklessly, it is charged, as their commissions depended on the amount of business they did, not on the security of their investments. It is claimed that in many cases they lent money, not on the intrinsic value of the farms, but on their prospective value under favorable contingencies, or on their fictitious value due to transient "booms." The visionary values were never realized; the fictitious values collapsed with the booms that created them, and heavy losses were incurred. Many farms were found to be worth much less than the amount loaned on them; the owners abandoned them, and the mortgagees were left despondent. It is asserted that other associations of the kind operating in Kansas and other Western States, can escape the same fate only by prompt and prudent action.

A CHECK ON A GIANT MONOPOLY.

THE most powerful, offensive and dangerous monopoly in the country has just received a judicial check. For a long time the Standard Oil monopoly has claimed the entire use of all lands leased for gas and oil rights only, in Ohio. Under this practice immense tracts have been retained in the grasp of the giant octopus to the detriment of public improvement and private enterprise. The Judge of the Court of Common Pleas of the State has just decided that this is all wrong—that the leasing of land for gas and oil rights does not prevent the owner from acting as he pleases with regard to the surface rights. With its customary shrewd unscrupulousness, the monopoly first secured the leases at comparatively low figures on the supposition that the "royalty," or subterranean rights alone were conveyed, and then it put in a claim for the whole. Of course this decision doesn't finally settle the matter; for the "Standard" is sure to appeal. It hires its lawyers by the year, so that further litigation will cost it little or nothing; while an appeal will be an expensive matter to its opponents, and is certain to have a deterring effect not only on the parties to the present case, but also on intending litigants. How many poor sufferers are withheld from asserting their just rights against railroads and other powerful corporations by the certainty that winning the first decision is only the commencement of protracted and expensive litigation, which is sure to harass and likely to impoverish them before the final arbitrament of the case, however just their claims.

Hence, as a rule, people are willing to compromise for a part of their rights or to forego them altogether rather than risk costly and interminable litigation with tricky and unscrupulous corporations. Moreover, by protracting litigation these bodies are for years enabled to retain their unjust holdings, or their opponents are kept out of what justly belongs to them. In the present case the people who own the land, in spite of the decision in their favor are hardly likely to invest heavily in its improvement until the court of final resort shall have passed on the matter. Combination is the only means of successfully combatting such organizations, and the land-owners here should combine to defray expenses and push the case.

OUR TRADE WITH OUR SOUTHERN NEIGHBORS.

THE Pan-American Congress is, very justly, attracting a great deal of attention just now as likely to lead to closer friendly connections and broader commercial relations between all the independent States on this side of the Atlantic. A few figures illustrating the condition of our trade with our southern neighbors are therefore in order. Reports of the Bureau of Statistics show that in 1860 the exports of the United States to all the countries represented amounted to $33,251,672. In 1888 our aggregate exports were valued at $695,954,507 and of this amount our exports to these countries were valued at $52,792,216—an increase of 52 per cent. in 28 years. In 1860 the British exports to the same countries amounted to $68,271,831, and in 1887 they were valued at $115,012,635—an increase of 68 per cent. in 27 years. Thus Great Britain's increase of exports during the period under review was nearly as great as the total amount of our exports to those regions in 1888.

On the other side of the account, statistics show that in 1860 the imports into the United States from those countries were valued at $73,342,817, and in 1888 they had increased to $158,656.819 out of an aggregate of $723,957,114. In 1860 the imports of Great Britain from the same regions amounted to $68,062,797, and in 1887 they had only increased to $68,619,217. From these comparative figures it would seem that our southern neighbors could afford to cultivate closer relations with this country which buys $158,000,000 worth of their products, than with Great Britain which buys only $68,000,000 worth of them. Why this unequal balance of trade? Well, the vast increase in our imports is due to increased consumption of coffee, sugar, and other tropical commodities by a population that has doubled since 1860. On the other hand, Great Britain, with only a little more than half our population, has had no such marvelous increase in the number of its inhabitants, and does not need nearly so much of the same class of goods, which are the chief exportable products of those countries. But why do not our southern friends buy more of our products? Is it because they can get manufactured goods cheaper elsewhere; and if so, is the fact due to the higher price of American labor, as claimed by the "protectionists;" or to the enhancement of our wares by the tariff, as claimed by the "free-traders?"

WOOL-GROWERS AND WOOL MANUFACTURERS.

REPRESENTATIVES of the National Association of Woolen Manufacturers met in this city the other day to discuss the tariff on wool and woolen goods. Some weeks ago a preliminary meeting of the Executive Committee of the association convened for the same purpose, in Boston. It has been an "open secret" that the original object of both meetings was to take prompt measures for urging upon Congress the total repeal of import duties on coarse carpet wools, and the repeal or a great reduction of the duties on all the higher classes of the staple. The "free-trade" and "tariff-for-revenue-only" papers were crowded with articles on the insanity of a tariff on raw materials and especially on wool. In nearly every case, representative wool manufacturers were quoted as authorities for the most startling figures and the most bitter denunciations against the tax on such foreign products. It looked as if the long-expected, but much-deferred battle between those doubtful allies, the wool-growers and wool-manufacturers, was about to begin. The National Wool Growers' Association had uttered no doubtful note of warning—it had emphatically declared in favor of a genuine "protective tariff" on wool as the only means of saving from ruin a highly important agricultural industry of the country, and it had clearly intimated that if tariff protection should be removed from the farmer's wool in favor of the manufacturer's pocket, it would be expedient to remove tariff protection from the manufacturer's woolens in favor of the farmer and the rest of the people. The manufacturers appear to have paid good heed to this warning. In the resolutions they passed, no demand was made for lower duties on wool as a raw material, the fixing of the duties on it being left wholly to Congress. The resolutions, however, complain that in its revision of the tariff in 1883, Congress reduced the duties on manufactured woolen goods so far beyond the reduction it made on the duties on wool, as to destroy the compensatory character of the former, and they demand of Congress a revision of the tariff, in which there shall be placed on manufactured woolen products a duty fully sufficient to compensate for whatever rates of duty public policy may require to be placed on the raw material. It is very evident that so far the wool-growers have had the upper hand, and it will be their own fault if they lose the advantage.

CLOVER SEED.

THE statistics regarding this crop show some curious features. The value of the crop has slowly grown from year to year until it is now entitled to a place among the cereals. Here is a record of the crop for the past 30 years. For the sake of comparison we give also the production of "all other grass seeds" for the same years. The figures represent the number of bushels:

	CLOVER SEEDS.	OTHER GRASS SEEDS.
1850....	468,978	416,831
1860....	956.188	900,040
1870....	639,657	583,188
1880....	1,922,982	1,317,701

The estimate for the present year is over 2,500,000 bushels.

A curious fact is brought out from a study of the crop production by States. In 1850 the States of Virginia, Pennsylvania, Ohio, New York and New Jersey produced 80 per cent. of the entire crop, with Pennsylvania far in the lead. In 1860 Michigan, Ohio, Pennsylvania, New York and Indiana produced 80 per cent. with Pennsylvania but a few thousand bushels ahead of Ohio. In 1870 the same States produced 85 per cent., Pennsylvania still ahead. In 1880 the States of Illinois, Indiana, Michigan, New York, Pennsylvania, Ohio, and Wisconsin produced nearly 90 per cent. of the crop, with Ohio in the lead, closely followed by Michigan. At the present time Michigan leads and the crop is becoming more and more popular in that State. Clover seed seems to follow wheat—towards the north and west. The southern counties of Michigan are giving place in the production of this staple to the more northern counties where farms have been cleared out of the pine forests. In fact, it is believed by many that clover seed will prove one of the most profitable crops for these "stump farms," where "wheat, clover, sheep and wool" are to bring the cash. Several of our correspondents refer to the work of the clover midge.

The damage done by this insect is almost beyond the belief of those who have never lived in clover-seed-growing districts. Many barns in New York and Pennsylvania contain absolutely useless tools for preparing the seed. About the only remedy that seems to give any satisfaction is that mentioned by our correspondent J. W. on page 693. As explained in the RURAL'S Hay Special, this remedy consists in running the mower through the field about the middle of May, leaving the product on the ground as a mulch. A vigorous crop of blossoms will develop after this. This comes between two broods of the midge and thus escapes attack.

BREVITIES.

CHRYSANTHEMUMS and late-blooming gladioli should cheer the garden now.

LET'S all move to that Canadian country (see page 697) where there are no potato beetles!

MR. FALCONER has discovered a new use for dwarf Limas. Read his article on page 690. Mr. Falconer writes from actual experience and always with caution and accuracy.

WE shall be interested to know how the Canada thistles come out of that Canadian silo described on page 697. He says he can make cheaper silage with this than with corn. "There may be a great future for the much-abused thistle."

PROFITABLE use has just been discovered for another waste Southern product—an excellent quality of fine or coarse paper can be made from rice straw hitherto considered worthless; 4,000 tons of it have been shipped from Savannah to New York as paper stock. Whatever planters may get for it will be clear profit. Doubtless paper-mills will soon be established in the neighborhood of rice plantations.

MR. J. W. KERR, of Caroline County, Md., sends us four Japan chestnuts, the product of two burrs, which average five inches in their larger and four inches in their smaller circumference. In quality they are coarser in flesh and not so sweet as are our American chestnuts, but better than the average Japan seedlings. The nuts are much larger than those of the Paragon, but the quality is inferior. Mr. Kerr says: "How young the Japan seedlings do go to their work!"

Horticultural.

BEANS.

(*Continued from Page* 691.)

would say that our attention was first drawn to this novelty in the summer of '87 by Messrs. T. W. Wood & Sons, seedsmen, Richmond, Va., who had had a small supply of it for two or three years. We purchased the entire stock from them in the fall of '87 and had the stock grown in '88 in at least six different localities: Genesee County, New York; Rockland County, N. Y.; Monmouth County, New Jersey; Hudson County, N. J.; Virginia and Georgia. This wide distribution of the stock seed proved conclusively that it is a variety which will do well in any section where the pole Limas will. From Messrs. Wood & Sons we learned that they had obtained the stock of this variety from an old trucker in the vicinity of Lynchburg, Va., who had grown it for a number of years for the Lynchburg market; he stated that he had procured it originally from a negro who claimed to have found a single plant growing by the roadside in the mountains of Virginia. The darky's story, however, is rather unlikely, as in all probability it originated as a "sport" from the Carolina or Sieva. PETER HENDERSON & CO.

THE ORIGIN OF BURPEE'S BUSH LIMA.

BURPEE'S BUSH LIMA originated 50 miles from here with one of our customers, a progressive Chester County (Pa.), trucker. In 1883 his crop of large Lima pole beans was destroyed by the cut-worms, and as he was going over the field to pull up the poles he discovered a perfectly formed bush only six inches high. Upon examination he found that the plant had been cut off about half an inch above the soil, and that it had bent over and re-rooted, resulting in this bush. He is disposed to give credit for what proved eventually to be his good fortune, to the cut-worm. However this may be, the fact remains that this little bush showed no tendency to run, was carefully guarded and matured three small pods, each containing one large bean. These three beans were carefully planted in the spring of 1884. One of them produced the usual Lima pole bean vine, while the other two retained the perfect bush character of their parent, but, being more vigorous, bore large pods, containing beans fully equal in size to the large Lima pole bean. Since 1884 he has been carefully cultivating and developing the bush variety, rigidly discarding any plants showing a tendency to throw out runners, until now (Sept. 14) his entire field presents as perfect a type of dwarf bush beans as even the long-established dwarf German wax beans. Last winter we purchased the right to the exclusive control of this bean and the originator gave us a few beans to plant in our trial grounds, where they can be seen in comparison with Kumerle's Dwarf, and Henderson's Bush Lima.

I send the RURAL fresh leaves of each of these, from which alone it can see the distinct character of ours, as well as in the pods and beans. Although the last to be introduced, I think ours probably was the first of the dwarf Limas originated. Henderson's is a dwarf form of the small Sieva, and Kumerle's is a dwarf type of Dreer's Lima. I have just now been comparing the different Limas in our trial grounds, and find that the pods of our bush Lima average fully as large as the pods of the King of the Garden Pole Lima. Some time since while going over his crop with the originator, I spoke particularly of the wonderfully prolific character of the dwarf bushy plants. He said: "Yes! I counted 52 mature pods on one plant when harvesting my last crop." This led me to examine more closely, and the first plant I selected bore 58 pods and was still full of blossoms. The plants send out numerous stiff, upright branches almost from the very ground. The editor will notice the thickness of the main stem and branches, also the unusual size, dark-green color and thick, leathery substance of the leaves, indicating their strong constitution and vigorous growth. W. ATLEE BURPEE.

[The plant of the above variety sent to this office bore 26 pods of which the one illustrated is as large as any. Most of the pods had three beans, a few two and several four. EDS.]

ORIGIN OF KUMERLE'S DWARF LIMA.

FROM James M. Thorburn & Co., the introducers of the Kumerle, we learn that for a number of years a dwarf form has been noticed among Dreer's Pole Lima, in various parts of the country, and from these selections have been made resulting in the dwarf variety now introduced as Kumerle, of which there is, as yet, a very small supply. A single bush sent to this office bore 47 pods, most of which contained three beans, some four and occasionally only two. The beans were fully as large as those of Dreer's Lima. The illustration, which is a faithful portrait of this plant, shows the average size of mature pods and seeds.

The R. N.-Y. raised about one dozen plants of the Kumerle. We find it a true Dreer's Lima. The bushes are very prolific and vigorous without the least sign of running to vine.

HENDERSON'S SIEVA was planted the same time as pole Limas at the Rural Grounds and matured about 10 days earlier. The bushes bore all the way from 25 to 50 pods averaging nearly three beans each. A few pods contained four. The leaves are smaller, of a much darker color and firmer texture. The upper side is glossy. The bushes averaged 18 inches high, the flowers smaller and the racemes twice as long. The illustration shows one of the plants, as well as the pod and seeds.

The Garden.

THE VEGETABLE GARDEN.

WM. FALCONER.

THE SEASON.—The weather recently has been raw, cold and wet, and the land is wet and in poor condition for fall-growing vegetables. But we have not yet (October 3d) had any frost.

LIMA BEANS.—Lots yet but they are getting old as we had no bright, warm weather in late summer to set and fill up a succession of pods. I am gathering the well-filled but not over-ripe beans for use in winter.

SNAP BEANS are yielding well, and I am now picking Mohawk and Valentine that were sown August 8. The same kinds sown August 16 are in bloom and beginning to pod. I have just placed frames and sashes over them, and in this way and by banking around the frames with earth or manure, and covering over the sashes with straw mats at night, I expect to pick snap beans until into November.

RABBITS are now very destructive to young snap beans; they eat the tops. A dusting of lime, or plaster and Paris-green scattered on the beans when they are moist will save them.

FIELD MICE now take to the bean frames and work much damage. To hunt them up and kill them is the only remedy.

CELERY is growing superbly. I never had finer late celery than I have now, and that too from seed sown May 24. All celery for use before New Year should now be banked up fully, and even our latest celery should be "handled" so as to have it in close-together heads, and, in rigorous districts, to save it from frost. While a few degrees of frost may not visibly hurt celery, it certainly does it no good, therefore protect it from frost by banking it up with earth. North of New York prepare for laying it past for winter about the end of this month; south of New York from the fifth to the 15th of November is the usual time for this work.

THE WHITE PLUME CELERY.—At Buffalo some weeks ago, a gardener from Ohio was telling Peter Henderson and myself that he finds no difficulty in keeping over this celery until April; in fact he finds that it keeps just as well as any other kind. Well, perhaps it does. I'm not as smart as he is by a couple of months. I never yet had a white or a yellow self-blanching celery of any sort that kept in paying condition into March.

PEAS.—These look well. I am now picking very good Daniel O'Rourke Peas from August-16 sowing; in fact this, one of the poorest peas in quality, is the best late pea I have. Blue Beauty is good but now a week later than O'Rourke; in early summer there would be only a couple or three days' difference between them.

SPINACH isn't growing as well as I would like. So much wet weather kills many of the germinating seedlings and rots off older plants, and now the never-failing leaf-miner maggot comes to prey upon and spot the leaves. The young spinach we now are picking was sown August 24th. For wintering in frames we sowed two weeks later.

NEW ZEALAND SPINACH is most esteemed for hot summer weather when common spinach can be had only with difficulty, but it also comes in splendidly in cold, raw summers too. We never had it finer than it has been this year. And as it is tender I have covered a patch of it with frames for further use.

LETTUCES.—We hope to cut from out doors for a month yet, but are prepared for emergency by having plenty in frames. We plant our winter lettuces in the permanent frames in our regular frame ground. Lettuces for use in October—December occupy the least sunny frames, because having made their growth early they need little more than keeping over, hence there's no call for the best places for them; those for use in December—March are planted in the warmest and sunniest frames, because this is the wintriest season, and the plants grow but little, and as they are apt to be much covered up, the warm position saves in covering, and permits of more drying and ventilating than could be done in less favored parts. From March onward we get our supply from hot-beds which generally are the frames emptied in December and January. Don't coddle lettuces, but keep them uncovered in favorable weather. Young seedlings and half-grown stock will stand several degrees of frost without hurt, but full-hearted lettuces should be protected from frost, heavy rains, sleet or snow. Young lettuces for filling into frames from now till January should be kept in a cold-frame and pricked off two or three inches apart.

PARSLEY.—Lift a lot of roots and plant them in an old cracker or soap box in light soil, or take a nail keg and bore a lot of half-inch to one-inch holes thickly all over its sides, and into these holes, with just the top of the crown sticking out, stick some parsley roots, filling up with soil as you go along, and you will have a really nice parsley patch in your cellar all winter.

CORN sown later than July 19, is not going to ripen up fit for using.

CARROTS sown August 6, will make nice roots, but anything sown later than that will not amount to much. Full-grown carrots have lost their leaves more than usual.

BEETS.—On light soil the August sowings are not going to amount to anything, but on rich land sowings made August 6 promise well. Eclipse is a more vigorous grower than the Egyptian and I like it better, for it bulbs up quicker. I do not expect to gather the winter crops for a month yet.

Farm Topics.

CANADIAN NOTES.

FARMERS in Ontario, especially in the Ottawa district, have full barns this season. Grain is good, and the straw crop is simply enormous. Oats and wheat stood level with the tops of the fences as long as they could stand, and then went down under their heavy loads of grain. A wet harvest has injured a considerable percentage, but the crop as a whole is most satisfactory. The potato crop is the best we have had for some years. But for the demand east, west and south, they would still be selling, as they did the latter half of August, as low down as 35 cents per sack of 90 pounds. Within the past two weeks shipments east and west have created a demand, and prices have run up to 60 and 70 cents, and are likely to go still higher. By the way, I have just heard that in the county of Bonaventure, P. Q., the *habitants* have never yet seen a potato bug in their fields. It would be a capital place in which to buy seed. The plants bear abundance of seed-balls, and the vitality of the potato has not been sapped by annual attacks of the bug and the use of arsenical poisons. We could not raise potatoes here at all without Paris-green, and plenty of it.

Silo building and fodder-corn are the questions that are agitating the minds of the more enterprising of our farmers here at present. My cheap wooden silos, capacity 100 tons and 92 tons respectively, costing only $100 and $150 complete, have been inspected by a great many growers of fodder-corn, and all who have seen them have declared their intention to build silos for themselves. Into one of my silos I have put 75 tons of green oats, peas, barley, vetches, thistles, mustard, lamb's-quarters and other weeds that had grown on a heavily fertilized and exceedingly dirty field. It is a regular vegetable hash, and if it cures well, as I expect it will, my cattle and horses will not want for variety in their food next winter. I am watching with considerable interest an experiment in siloing thistles. My neighbor sowed about an acre of rich garden soil with spring wheat. One particular ridge of that acre sent up such a mass of Canadian thistles as I had never seen before. Interspersed through it were a few strong plants of wheat. The ridge had been under squash vines the previous season, and the rough leaf and vine had caught and held every thistle down passing that way and the result was the magnificent crop of thistles. Rather than let them go to seed I obtained permission of my neighbor to cut that ridge out of his grain and put it in my silo. The thistles were a perfect mass of sweet-scented, purple bloom when I cut them making three heavy wagon loads, and they are now in my silo, cut in the regular fashion, their power for mischief destroyed forever. If they should prove to be good feed for stock, I can make cheaper silage by growing the Canadian thistle than I can with corn. They will produce two heavy crops in a season; nothing to pay for seed or cultivation, proof against excessive rains, spring frosts, bugs, cut-worms, crows, cold spells, smut and every other ill that corn is heir to. There may be a great future for the much-abused thistle—though at present I prefer to take my chances on corn.

Last season our corn was killed by frost on the 7th of September; this year's corn is still green and growing rapidly. After trying a great many kinds the last two seasons I have come to the conclusion that Angel of Midnight, a hardy yellow corn that ripens in this latitude, is the best for my soil. I cannot get the quantity of feed per acre that I can from red-cob ensilage; but the quality is far superior. This season's crop bears cobs averaging from 12 to 14 inches long, and the grain has a rich, creamy flavor that makes it very enticing food. I noticed in last year's silage the yellow corn seemed to ripen in the silo during the process of curing.

For information of Southern readers of the RURAL, who are under the impression that we live in a winter climate the year round, I may say that our market gardeners have been peddling tomatoes round Ottawa for the last six weeks at 25 cents per bushel—and choice varieties at that. The markets are fairly glutted with all kinds of garden truck. Melons hardly pay for carrying them five miles. We don't care for the competition from the South, for no one will buy the big, coarse, Georgia melon, that comes in here early in the season, once our own finer-flavored melons appear on the market. The banana has invaded us though, and tons of it are sold here now. Four or five years ago if an Ottawa fruit-dealer disposed of a few bunches in a season he thought he was doing well; now everybody buys them and they do not interfere with the sales of local fruits in the slightest degree. A. H.

Ottawa, Ontario.

Miscellaneous.

CORRESPONDENTS' VIEWS.

CORN AND HOME-MIXED FERTILIZERS.—My experience in raising corn this year with only a small amount of chemicals in the hill—65 pounds of dissolved bone black; 20 pounds of muriate of potash and 15 pounds of sulphate of ammonia—is such that for another year I want 10 times as much. With these chemicals I put two cwt. of plaster, about two cwt. of ground bone and six cwt. of black loam thoroughly mixed and sifted. With a large spoonful in a hill on sod without any manure on the land for 12 years, the corn is good, but on old ground, which received about 30 loads of manure per acre with a spoonful of this in the hill, the corn was over five feet high by July 12. Who says our experiment station does not pay when it gives us such experience as this? The whole cost of this half ton was $4.88. I do not say it is any better than any other fertilizer, but look at the cost. The articles given by the station cost $2.13. I put in the plaster and bone extra, and think I was well paid. Beans planted

with this mixture were very fine, being full of pods. The 2½ acres are rowed both ways, 3½ feet apart and planted with corn, beans and potatoes. As a result of my past experience, next year I shall plant potatoes in drills, for then it is much easier to put on the Paris-green. P. C.

WASTE OF MANURE.—In passing over the country I often see barns and pig-pens built on high ground just above some deep hollow into which drifts all the wash from the manure thrown out of the barn-yards and pig-pens and accumulating around them. I have in my mind now a certain place the owner of which I visited and tried to get him to subscribe for the R. N.-Y. He said he could not afford it; he had no time to read it. On looking around I found his barn, pig-pens and feeding yards located as described above. In the hollow below flowed a stream from a spring across which a dam was thrown so as to make a watering place for stock, and to catch the wash from all those places where his manure accumulates. In my opinion such men never will feel able to take a first-class agricultural paper or have time to read one.

GOOSEBERRIES.—The Triumph has fruited with me three years very satisfactorily. It is more prolific than the Industry and has not mildewed, and it has been so far the best I have ever seen.

APPLES.—I have fruited the Yellow Transparent and Wealthy Apples and they merit all that is claimed for them, except the claim for their early ripening. The first is later than the Harvest and the Wealthy is ripe in the last of August and first of September. I. HICKS.

Queens County, N. Y.

Woman's Work.

CONDUCTED BY EMILY LOUISE TAPLIN.

CHAT BY THE WAY.

OUR correspondent who writes of the healthfulness of housework is right; the daily domestic tasks do give a healthful series of calisthenics. The only thing lacking is abundance of fresh air, and this we are apt to overlook. Of course all chamber-work must be done, save in the most inclement weather, with wide-open windows—but frequently the need of ventilation is overlooked during other work. Still, a broom and a bread-pan would be a highly desirable prescription for many a woman suffering from some of the mysterious nerve ailments which seem to afflict so many.

* * *

ONE reason why housework seems such dispiriting drudgery to many women is because they make its most sordid and material side always uppermost, chief object of their words and thoughts. If necessity compels them to live frugally they make narrow, grinding cares conspicuous in every way. Now, one can't always ignore a narrow or empty purse, nor is poverty a thing to be ashamed of, but there is no reason in making the unhappiness of poverty everywhere conspicuous. If we are compelled to make shifts and expedients in household affairs—most of us are—let us take it cheerfully, and not thrust the expedient before every one. There is plenty to make life worth living, even if we do wear cotton gowns and walk over rag carpets.

* * *

THIS seems wandering far from the original subject. But we so often notice that the women who seem to suffer physically from their housework look upon it from the first as drudgery and nothing else. After all, good temper and cheerfulness lighten much of the hardest toil.

* * *

LAST week one of our correspondents made some very sensible suggestions relative to lightening the daily tasks. We believe fully in making preparations this day for the next day's toil, so long as too much is not attempted. A little bit of thoughtfulness the night before will ease many a busy day. One of our neighbors always prepares for sweeping day the night before, by moving the bric-a-brac and most of the furniture out of the parlor, so that sweeping may begin without unnecessary delay. Even in the ordinary living room, a good deal of clearing out may be done the night before, and this usually takes longer than the sweeping.

* * *

ANOTHER way of saving time is always to decide, the night before, of what the meals are to consist the next day. What is more perplexing than to decide on the dinner at two hours' notice, especially in the country, where deficiencies cannot be remedied at a moment's notice? It is far better to know beforehand, and decide on every detail of the bill of fare.

That question of the daily bill of fare is most perplexing: it is not so hard to decide on the dinner a day ahead, or for a week at a time, but think what an endless vista of dinners one must look forward to. Really, a housekeeper's lot is not always a happy one.

Breakfast is not always an easy meal to arrange; it is difficult to provide a change where hearty food is desired. In too many cases, breakfast consists almost entirely of fried meats and vegetables, fried pork, fried sausage, and, crowning horror, fried beefsteak. Of course, where an early breakfast must be hastily cooked it is impossible to get up a fire for broiling, but still frying should not be the only method of cooking. In addition, there should always be some cereal, rolled oats, crushed wheat, oatflake, or something of the kind. There is no excuse for omitting this on a farm, where milk should be plentiful. But no rigid rules can ever be laid down for the bill of fare; it must be left to the tastes and fancies of each family individually.

THE HEALTHFULNESS OF HOUSEWORK.

OLIVE E. DANA.

THE out-door haunts, which have been so alluring, are growing cheerless and chilly. Vacation is done, and all life's activities are calling with new authority. Summer pleasures and pastimes are fast being forgotten, or are laid away safely in memory to brighten dark days or tide over dull hours. The little boats lie with idle oars, and the fishes fear no longer the angler's skill. Only the crack of the hunter's rifle rings through the forest stillness.

Those who have found muscle-making exercise in woodland tramps and up-river rows, are very likely, if their work is of brain and nerve rather than of hand and limb, glad to seek some healthy play of muscle at the healthlift or gymnasium. Happy are they whose vocation calls for both hand-work and head-work in healthful balance. Happy are they whose tasks do not leave one set of muscles entirely unused, while on another, perhaps, the tension is exhausting.

The house-keeper has no such discrepancy to complain of; her work calls all the faculties into healthful action. It stretches every muscle, yet the frequent change of attitude and motion forbid undue strain on any. I think the healthfulness of housework is too little regarded. Because one may have too much of it, because it is not wisely planned, because surroundings are physically harmful, or because one gets, for any reason, too little fresh air and social intercourse, it does not follow, as a logical conclusion, that the work itself was injurious. For the very opposite is true. Somehow neither women nor physicians seem always to take sufficiently into the account the beneficent influences, tonic and sedative, of a regular course of housework; the strength it gives to flabby muscles; the tone it imparts to jaded nerves; the alertness, both of mind and body, which it demands and secures. And writers, treating of health and exercise, and health by exercise, give this very cursory motive usually, or very likely none at all.

It is true that Mr. Higginson, in his "Out-Door Papers," had occasion to speak of "those bracing calisthenics," "bread-making in well-ventilated kitchens, and sweeping in many-windowed rooms." But what woman who does her own work doesn't know that these two employments, important as they are, include but a tithe of "the motions" one must "go through with" in even one forenoon's work?

Though one complain ever so bitterly of "drudgery," she can but confess that, like most other tasks miscalled by that name, it is the most wholesome of work. And however monotonous she may call it, and lacking in variety, she will own in wiser moments, that the lack was all her own,—of heart or hopefulness or wisdom, of out-door air or neighborly interests, of broader out-look or intelligence, or of some other God-created element—and by no means the fault of the housewife.

And it is something, surely, when the November rains are falling and the wild winds blowing, and by-and-by the white snows are drifting and the mercury is at zero, to feel that one's "constitutional," if she needs one, or calls it by that name, may be taken between dining-room and kitchen, between pantry and cooking-stove, to know that by the time the morning's baking is finished, and the chamber work is done and the parlor and sitting-room set in order, and the plants showered, and the piazza-floor swept, and the outer kitchen made tidy, she will have had the benefit of such a series of calisthenics as no schoolroom exercise can offer, or the gymnasium itself afford, and will beside, so far as she is able, have made the home wherein she reigns "a thing of beauty and a joy" for 24 hours longer.

AT THE FAIR.

J. H. G.

THE agricultural press indulges in about the same amount of scolding year after year because of the presence of fakirs and horse-racing on the fair grounds. The fact, however, is that in the vicinity of New York at least, the fairs which attract the greatest number and variety of fakirs and side-shows, and which have the best trotting, are the ones which are patronized most liberally by the farmers. The average farmer sees horses and cattle, and pumpkins and corn all the year round, and he usually goes to the fair for a change. He wants to meet old friends and acquaintances and have a little fun.

The manager of the most successful local fair within 100 miles from New York, said that so long as the fair was a "moral" one it was in financial trouble, and finally, failed altogether; but since it had been run in a business-like way the value of its property had been increased from an insignificant sum to something like a quarter of a million dollars. He added: "Farmers do not want to see pumpkins and squashes; they see them every day. What they want is excitement and fun." It is lamentable, but evidently too true that the mere exhibit of farm products will not attract any considerable number of farmers—within a wide radius of New York at any rate.

AUTUMN FLOWERS.

G. S.

THERE is perhaps no place where the semi-aquatic wild flowers grow to greater perfection and beauty than in the low plains on the east end of Long Island. As a matter of course, the numerous varieties of golden rod (Solidago) predominate, and this common, but not the less beautiful because it is common, flower forms an appropriate and gilded frame for the more brilliant and rarer flowers of the meadows. I have in mind a low, marshy place—evidently an old pond bed—almost entirely filled with the magnificent Cardinal Flower—Lobelia cardinalis. It forms a circle of the most brilliant red, while the surrounding meadow is yellow and white with the golden rod, wild carrots, etc. While I am passionately fond of wild flowers, the pleasure is greatly marred by the difficulty and uncertainty of their identification, and in this I am not alone. A book nicely illustrated and written in a popular style upon the wild flowers of the Atlantic seaboard would have an enormous sale.

The writings of Burroughs, Thoreau and others have increased the interest in the woodland and the meadow; but amateurs who have no time to study botany as a science, are so embarassed at their ignorance as to lose very much of their pleasure. There is an opportunity for remunerative missionary work in this field and it is to be hoped that some of our botanists will take up the subject.

GOLDEN GRAINS.

IF there be one thing upon the earth that mankind love and admire better than another, said General Garfield, it is a brave man; it is the man who dares to look the devil in the face and tell him that he is a devil.....

ALL that God blesses is our good,
And unblest good is ill;
And all is right that seems most wrong,
If it be His dear will.

—*F. W. Faber.*

BOOKS, says Addison, are the legacies that a great genius leaves to mankind, which are delivered down from generation to generation, as presents to the posterity of those who are yet unborn.....

PLATO said that there is nothing so delightful as the hearing and speaking of the truth. For the reason there is no conversation so agreeable as that of the man of integrity who hears without any intention to betray, and speaks without any intention to deceive.....

SIDNEY SMITH says find fault, when you must find fault, in private, if possible: and some time after the offense, rather than at the time. The blamed are less inclined to resist, when they are blamed without witnesses; both parties are calmer, and the accused party is struck with the forbearance of the accuser, who has seen the fault, and watched for a private and proper time for mentioning it.....

ROBERTSON says we should forget mistakes or organize victory from them.....

PHILLIPS BROOKS thinks that no man or woman of the humblest sort can really be strong, gentle, pure and good without the world being better for it, without somebody being helped and comforted by the very existence of that goodness.....

WE must not hope to be mowers,
And gather the ripe gold ears,
Until we have first been sowers,
And watered the soil with our tears.

—*Alice Cary.*

ELIHU BURRITT said there is no power of love so hard to get and keep as a kind voice, a voice that shall speak at all times the thoughts of a kind heart. Watch it day by day, as a pearl of great price, for it will be worth more to you in days to come than the best pearl hid in the sea. A kind voice is to the heart what light is to the eye. It is a light that sings as well as shines. Train it to sweet tones and it will keep in tone through life.....

PROF. THOMPSON says to the man who feels that there is no position, that there are no circumstances in which he may not by effort and patience, by faith and prayer, fulfill the purposes of the Creator regarding him—to such a man the question: Is life worth living? is irrelevant, for it has been answered beforehand, and answered in the affirmative.....

THE BOSTON BUDGET says a Boston Sunday School teacher was endeavoring to impress upon the minds of her pupils the necessity of good behavior. "You must be very careful how you act," said she, "for if you act badly you will be punished, while if you act well you will be rewarded. Now, my dears, can any one tell me what he will get if he acts well?" A bright little fellow whose father was an actor, immediately replied: "Det talled before de turtain, I dess."

Domestic Economy

CONDUCTED BY MRS. AGNES E. M. CARMAN.

"No iron so hard but rust will fret it,
No perch so high but climbing will get it,
Nothing so lost but seeking will find it,
No night so dark but there's daylight behind it."

THE INFLUENCE OF FATHERS.

MARY WAGER-FISHER.

IN a certain way, the father seems to stand as an ideal model for the boy more than the mother does for the girl, so that the old adage: "Like father, like son," has a peculiar significance. I am often reminded of this by hearing my own laddie say that he likes a thing done in this or that way because it is "papa's way," or because "papa does so," or "thinks so," and

Miscellaneous Advertising.

When Baby was sick, we gave her Castoria,
When she was a Child, she cried for Castoria,
When she became Miss, she clung to Castoria,
When she had Children, she gave them Castoria

nothing fires his spirit of emulation more than to hold up the father's gratification as an incentive. There is no end to the verbiage that has been written and spoken concerning the influence of mothers, and what it may accomplish. But if, by some hocus-pocus of evolution or conversion, all fathers could instantly be made into the kind of men they wish their sons to be, what more could be desired for the human race? That fathers do not realize the formative character of their example, or, realizing it, fail to turn it to the best account, is very evident. If they did, one would see no fathers who smoke or chew, or use vulgar or profane speech, who equivocate, or cheat, are untidy in their dress or surroundings, cruel to their horses or cows, unkind, given to outbreaks of anger, selfish or lazy, or ill-mannered.

But as affairs are now managed, or arrange themselves, a great majority of fathers leave the training of the children not only physically but morally, to the mothers, as though the inculcation of morals and manners, were a peculiarly feminine business, and as if women were in a way the guardians of the social and moral forces of society, and so long as women are honest, good and true, it would matter so much the less what men are—the virtue in the world would, in spite of them, be housed and cared for, and transmitted to posterity! It sometimes happens that boys left fatherless, are trained into admirable men by the mother alone, in which case she is generally regarded as having performed a difficult task with great success; when, in point of fact, the achievement might have been attended with far more difficulty if the father had lived. Almost any father, after he has been long enough dead, becomes a kind of saint or hero to his young children, and nothing is easier or more natural for the mother than to make the most of this idealized character. But with the father alive and as un-ideal as possible—slovenly, ill-tempered, disobliging, selfish, thoughtless, boorish in manners,—what headway can a mother hope to make in training her sons to be gentlemen? She might as well try to make water run up hill. If the father smokes, or chews, or swears, or "slangs," why should not the boy? Or if he eats like a pig, appears at table dirty and unkempt, flings his wearing apparel down for some one else to hang up, speaks with crossness and impatience, is there any reason in the world why the children should not imitate him in these things? To *honor* the father is a Biblical command that even the civil law insists upon; but those whom children *honor* they must perforce emulate, and to expect that the boy will be polite and considerate of others, when the father is the reverse, is to expect thorn bushes to bear peaches.

That women exert great influence, goes without saying; but that their particular influence can counteract the evil example of men, is an absurdity. The old doctrine that Cæsar's wife must be without reproach, although Cæsar himself may be a villain, has borne no end of bitter fruit. If a man has intelligence and conscience, he can not marry and take on himself the responsibility of fatherhood, without feeling the necessity of making of himself, so far as it is possible, a model which his sons will do well to imitate, for if ever a man's vices and faults appear to him in an uncomfortable light, it is when the eyes of his little children are turned upon him. No "eye of God" was ever more alert or penetrating than the eyes of children, and every man who has a son growing up at his knee should never, through inertia or carelessness allow himself to forget that he stands to the boy as a model of what the child himself aims to become—"just like father."

If fathers and mothers are better in fact than childless people, as is commonly accepted, it is solely owing to the restraining and developing power of the presence of children. For the "children's sake" there is much done and left undone. They stimulate to thrift, industry, honesty, respectability, education, wealth, influence, generosity, and sometimes to less desirable results when the parents are bad. But if parents realize their influence, they must by necessity, if not hardened in sin, keep keener watch over their speech and actions when children are about than when the home is childless. And if men will reflect upon the influences they imbibed in their own childhood they cannot but see how much they gained or lost through the good, bad, or negative character of their father. A good father is as priceless a possession to any child as a good mother, and the child which has both has the best inheritance the world has to bequeath.

SURE cure for indigestion—stop eating!

BROOM—woman's badge of neatness.

AUTOGRAPH QUILTS.

THIS is a day of autograph hunters. The epidemic assumes various forms. One lady of my acquaintance has an album of several hundred postal cards from people whom she admits she never saw, and never expects to see. Another rage is the quilt autograph. Few people at present have the temerity to aspire to the crazy-quilt. For my part I have not yet been able to decide whether I like such things or not, for I have seen so many that were originally intended to be things of beauty, witched and bewitched into what really appeared more the productions of the weakened brain of some poor æsthetic lunatic. In fact I never see a crazy-quilt without a vivid childhood remembrance of a kaleidoscopic view I once had after falling from a high swing. Autograph quilts containing a block from each State and Territory in the Union are also much in vogue.

My idea of an autograph quilt is entirely different, and as it is original with myself I will give it. I am saving a piece of each dress and apron of my children's clothes from their babyhood up. Upon each piece I sew a bit of paper with the date and age of the child at the time it wore the garment. After I shall have ceased collecting I shall make each a quilt of the pieces from the dress of each particular child and then with indelible ink mark each block with the age of the child at the time the garment from which it was taken was worn and also with the name of the garment. What think you of my idea? Try it, mothers. It will be something the children can always keep, and something they will prize above gold, long after dear mother has crossed the Mystic River into the great beyond. I love to piece quilts and expect to be just old-fashioned in that way all my life. During our warm summer weather we have had sewing classes in which we have taught our young girls how to sew, and piece quilts, and we find it one of the best ways of teaching little girls how to use a needle, and really an economical way too, for every household has more or less pieces to spare, and the quilts are always valuable.

MRS. F. A. WARNER.

A CHAT ABOUT HOUSEHOLD MATTERS.

IT is very much the fashion of fault-finders to criticise what they call "frying" beef, pork, or meat of any description. But is it not true that there is a right and a wrong way of doing everything? And a good cook can fry beefsteak and make it as palatable as a roughly broiled one. To broil meat satisfactorily requires good coals and plenty of them and in the ordinary wood fires kept by most farmers in the kitchen, how many times in a year will there be a bed of coals in shape at the right time to enable the cook to broil beefsteak that will be wholesome? If cooked over a blaze it is apt to be smoky. One thing perhaps that every one may not have noticed is, that beef, whether broiled or *fried*, should be eaten at once, and the slanders that have been bestowed on beefsteak fried, are often due to the fact that it has stood so long after being cooked that it has become tough, before being put on the table.

To fry properly, chop or pound the steak well; if there is much fat trim it off and fry out the grease to be used in cooking the rest of the meat, or put a little butter in the spider; have it hot and put in the steak and cook fast, turning often and being careful not to burn it. Salt it when just done, not before, or the juice will run out leaving the meat tough. Have the platter hot, and when the meat is done lay it on the plate and spread some butter over it; cover closely and send it to the table as soon as possible. Some cooks have the salt and butter melted together and pour it over the meat while it is all hot. Cooked in this way, meat that would be called unfit to eat if fried in the ordinary way, will be more palatable than that which has been broiled unless uncommonly favorable conditions have accompanied each stage of the broiling. There often seems to be a kind of fashionable affectation in the custom of decrying ways which prevail among different cooks. Any one who can eat with relish the half-cooked, demoralized-looking beefsteaks often encountered at hotel tables, ought not to be finical about eating steak that has been properly fried.

This year we have thought it to be quite an improvement that our men and boys, during the season of binding grain and cutting up corn should wear long stocking legs over their sleeves. The feet are cut off and the legs drawn up over the sleeves, above the elbows, and kept in place with safety pins. The juicy weeds stain and soil the sleeves so much that they are hard to wash and the look of the material is spoiled.

At this season the flies in almost everybody's pantry and kitchen are an intolerable nuisance; their presence seems almost unavoidable. The use of fly-paper is sickening, with flies dropping everywhere, so that we almost welcome Jack Frost who helps us out. I am told by a handy housekeeper who has tried it, that a mixture of equal parts of castor-oil and melted resin spread on old writing paper makes a very effective kind of sticky fly-paper which one can afford to have and use, and that it helps to abate the nuisance.

AUNT RACHEL.

CARE OF THE HANDS.

MISS K. G. H., says she keeps her hands presentable by using lemon juice and oatmeal. Will she please tell how it is done? H. D. S.

ANS.—Rub the hands thoroughly (after washing) with a piece of lemon, particularly after doing work that has left the hands in a bad condition. Then rub with a mixture of oatmeal and water. I do this sometimes two or three times every day and always the last thing at night. Follow at night with a few drops of glycerine lotion. Wear gloves when practicable. K. G. H.

JELLY FROM TRANSCENDENT APPLES.

IN answer to Mrs. Levi H. Niles, I would say that I make jelly from Transcendents in the same way as from crab apples. Core the apples and stew until soft, then strain through a bag. Boil 10 minutes, allowing one pound of sugar to each pint of juice. It is very nice indeed.

LAURA WOODBURY.

EXTRACTS FROM PRIVATE LETTER.

OUR men folks have to-day completed the filling of a large silo—a new experience, or rather a new departure in farming for us. In the house we have found the filling of it a serious thing, not on account of the extra hands, but because while the work has lasted we women could not have the use of a horse for any purpose and have therefore felt rather confined. The green corn has been run through a feed-cutter, and the tread-power used required two heavy horses. The two teams required to draw the loads of corn from the field exhausted the supply of horses that we could drive. Perhaps this is not interesting to you, but it is an incident of farm life.

News of the Week.

HOME NEWS.

SATURDAY, October 12, 1889.

THE steel cruiser Dolphin, built by John Roach, was objected to as "structurally weak" by the last Administration, and the worry about her acceptance by the Government is said to have caused her builder's death. She has just returned from a cruise round the world, after making 58,000 miles in all sorts of weather, and she hasn't sprung a joint or showed a sign of weakness anywhere.....At a secret meeting of the old French colony at Montreal on Tuesday, it was decided to invite Gen. Boulanger to take up his residence among his compatriots in Canada until France should recall him to rule or fight..... Southern progress of late has been unprecedented. In the last two weeks about 17 or 18 new furnace projects have been reported there and contracts have already been made for building about one-half of them, while a dozen or more are being organized and will shortly be made public. The sales of mineral and timber lands for last week in large tracts have aggregated probably half a million acres, while negotiations are pending for still larger bodies, including 300,000 or 400,000 acres of timber land in Mississippi and several hundred thousand acres in East Tennessee, the purchase of the latter by a $6,000,000 company having been virtually closed..... Yellow Jack has appeared at Key West, Fla.; but owing to the lateness of the season and the precautions taken, there is little cause for apprehension that it will spread much there, and hardly any that it will extend elsewhere.....Delegates to the International Maritime Conference are arriving in Washington, the delegate from China having put in first appearance. Twenty-three of the most important countries in the world, controlling 90 per cent. of the world's tonnage, will be represented by 50 delegates. The maritime regulations adopted by the body will certainly soon prevail all over the globe.....President Corbin, of the Reading Railroad, is said to be interesting foreign capital for the formation of an Anthracite Coal Trust..... Down to October 1, 3,111 miles of railroad had been built in the United States in 1889.....The Haytian Constitutional Assembly is in session and will doubtless soon elect Hyppolite to the Presidency..... Washington was made gay during the week by the presence and parading of 15,000 Knights Templar whose rich but rather fantastic costumes, plumes and armor made a gala show. Of the 85,000 members of this mainly social, partly charitable and quasi semi-military Christian Order, the, most picturesque adjunct of Masonry, 80,000 are Americans. The next triennial conclave will be held at Denver, Colorado. .....The delegates to the Pan-American Congress have been inspecting Massachusetts factories and workshops by day during the week and have been right cordially entertained by wealthy representatives of the Old Bay State at night. The double tasks, especially those by night, are likely to prove too much for some of 'em. Of course, as the Congress has no power, it can make no treaty—all the members can do is to make reports and recommendations to their respective governments. There is some complaint in Canada because the Dominion was not asked to send a representative to the Congress; but owing to Canada's dependence on Great Britain, our Government could not, without disrespect to the latter, hold any formal political relations with the Dominion Government. Independent American Governments alone are represented.....Loaded with honors and decorated with orders "our own" Edison has returned home more American if possible than before his triumphant trip to Europe..... Congressman Randall of Pennsylvania, is again very ill.....In the new States the Australian method of balloting proved highly satisfactory. In Connecticut even a modification of it receives much praise. It has been tried with uniform success in many municipal elections in widely-separated parts of the country. The better it is known, the better it is liked as a protection to the voter against intimidation and to the public against bribery..... In 1880 there were 142 cotton-mills in the South, now there are 389, and the capacity of the new mills averages much more than that of the old. The average dividends are not less than nine per cent. This prosperity is attributed chiefly to the proximity of the factories and the raw material..... Last Monday a Prohibitory Constitutional Amendment was defeated in Connecticut by a majority of 27,000. The fact that cider was put in the same diabolical category as rum made thousands of farmers who would have otherwise voted for it, vote against it, to prevent loss on their apple crops..... The present allowance of seamen in the Navy is 7,500, of whom a large proportion are foreigners. To man the new war-ships Secretary Tracy will ask Congress to extend the limit to 10,000. To provide the Navy with native sailors 750 apprentice boys are now allowed, and it is proposed to enlarge the limit to 1,000. When grown up, the ex-apprentices nearly always exchange to merchant vessels where the service is less strict and the pay higher. Moreover, while in the Navy no sailor can ever become a commissioned officer, the cabin boy may become captain in the merchant marine. Before go-ahead American sailors can be induced patriotically to man the American Navy, the unrepublican exclusiveness which gives a monopoly of all the higher officers to the Naval Academy at Annapolis must be relaxed or abolished.....A convention of colored religious associations lately in session at Indianapolis has very modestly demanded of Congress an appropriation of $100,000,000 to promote negro colonization in the West. There's a growing movement to get rid of the negroes in the South, which is checked only by the necessity for negro labor, white labor being unavailable. In the West there's an increasing tendency to object to negro immigration, even in Kansas.. County Judge Day, at Auburn, N. Y., has just decided that the new law substituting death by electricity instead of by hanging as the penalty for capital crimes in this State, is constitutional. He has no judicial knowledge that the punishment is cruel or unusual, as claimed by the lawyers who argued against the sentence in the case of Kemmler, the condemned wife-murderer. Of course, the case will be appealed to the General Term and then to the Court of Appeals, as the Westinghouse Electric Company, which is fighting the law, doesn't care for the expense.....The Dominion Government will issue no more licenses to mutual insurance companies conducted on the assessment plan, and the licenses already granted to many American and Canadian companies will not be renewed at their expiration at the end of the year. The stock companies are bitterly opposed to such organizations, and it appears that the licenses were issued through a misinterpretation of the law. What a hubbub such a step would create in this country where such associations are multitudinous!.....Jay Gould holds $20,400,000 of the $80,000,000 stock of the Western Union Telegraph Company. Here is its prosperous showing for the last three years:

	1889.	1888.	1887.
Gross revenue.....	$20,788,194	$19,711,164	$17,191,909
Operat'g expenses.	14,565,152	14,640,592	13,154,628

Total surplus.....	$8,611,401	$7,498,548	$7,009,185
Miles of pole.....	178,754	171,375	156,814
Miles of wire.....	247,697	616,248	524,641
Messages sent.....	54,108,326	51,463,955	47,894,530

The cost per message was 22.4 cents, against 23.2 cents of the previous fiscal year. The above amount of net earnings would pay over 7½ per cent. per annum on a capitalization of $80,000,000; but as nearly half that amount is "water," the interest on the cash capitalization would be about 14 per cent.—a pretty good showing for Jay's management..... Gen. Chalmers, Republican candidate for Governor of Mississippi, and Judge Frazee, the nominee for Attorney-General, have resigned their candidacy. They never had a shadow of a chance, could hire no halls to orate, and numerous threats from the white chivalry warned them that if they persisted in the canvass shooting would soon begin.....Old Jason Mitchell was tarred and feathered by 25 "prominent citizens" of Taylorsville, Neb. He offered no resistance, but has already collected $2,500 damages.....The second Piedmont Exposition was formally opened at Atlanta, Ga., Monday..... No Pension Commissioner has been appointed yet, much to the discontent of a multitude of bellicose editors who would much sooner have a man than a vacancy to abuse.....In April last Commissioner Tanner decided that $4 per month should be the lowest pension. The rating of thousands was thus raised without any legal authority. The ruling has just been rescinded by the Assistant Secretary of the Interior Bussey, who all along strongly antagonized the liberal Corporal.....The electric lighting wires are still steadily killing folks that come in contact with them, utterly regardless of the arguments against "electrocution." Four such "electrocutions" have been put on record this week.. .....The shipyards on the lakes are unusually busy, having 35 new steamers on the stocks. Steel is superseding iron faster than iron superseded wood.....A Carpet Trust, composed of at least 75 to 80 per cent. of the carpet manufacturers of the country, is said to be in course of formation. German and other foreign capitalists are reported to be ready to put $25,000,000 into it. .....Louisiana's Attorney General publicly charges ex-State Treasurer Burke with having deliberately issued or failed to destroy State securities to the amount of $400,000. A large amount of the missing "baby bonds" has been found.....The pneumatic guns of the dynamite cruiser Vesuvius were officially tried last Wednesday, in the Delaware River near Cramp's ship-yard at Chester, and gave complete satisfaction. Fifteen shots were fired in 17 minutes and the machinery worked without fault.....A Maryland oyster-packing syndicate proposes to raise the prices of the bivalves on the ground of the great damage done to the beds by the late storms. A trust in luxuries will hardly be successful, as curtailment of consumption would certainly follow increase of price.....

The Fortunate are the Isolated.

THE conspicuous part of an exception lies in the fact that it *is* an exception.

Compound Oxygen is an exception—that is, it is exceptionally good. Is not this the inference you get from the following?

EDGEFIELD, S. C.
"I know of my own experience and in my own family of the virtues of Compound Oxygen, as manufactured by DRS STARKEY & PALEN." THOS. J. ADAMS,
Editor of Edgefield Advertiser.

BROOKLYN, N. Y.
"I shall be glad to have you use me as a reference at any time."
GEO. W. BARTLETT, M.D.

BUNKER HILL, IND., March 14, 1888.
"I feel that I cannot say too much in praise of the Compound Oxygen Treatment." MRS. FLORENCE BLUE.

MELROSE, MASS., February 1, 1884.
"My husband ordered a Home Treatment. Since then, I have enjoyed almost uninterrupted good health and almost youthful vigor." MRS. MARY A. LIVERMORE,
(The Celebrated Lecturer.)

We publish a brochure of 200 pages regarding the effect of Compound Oxygen on invalids suffering from consumption, asthma, bronchitis, dyspepsia, catarrh, hay fever, headache, debility, rheumatism, neuralgia; all chronic and nervous disorders. It will be sent free of charge to any one addressing DRS. STARKEY & PALEN, 1529 Arch St., Philadelphia, Pa.; 120 Sutter Street, San Francisco, Cal.—*Adv.*

FOREIGN NEWS.

SATURDAY, October 12, 1889.

AFTER a world of diplomatic finessing, and "backing and filling" on the part of the Czar, that mighty potentate has finally consented to meet Emperor William, and last Thursday arrived at Kiel, the great German naval port on the Baltic, where he was received with broadsides from the German and English iron-clad fleets stationed there to greet him. Next day he went to the imperial palace at Potsdam, 17 miles southwest of Berlin, and afterwards to the latter city. Everywhere the greatest pains were taken to manifest the greatest cordiality, and everywhere the utmost precautions guarded against Nihilist plots which were much feared. After much urging, he granted an interview to Bismarck. It is thought the Chancellor offered him a "free hand" in Bulgaria and Armenia as the price of his withdrawal from the French alliance, coupled with a threat of the consolidation of the Kingdom of Bulgaria in case of refusal. The Russian semi-official papers, however, say the visit will not in any way affect the political situation..... In the supplementary elections last Sunday in France, the Republicans elected about two-thirds of the 183 members of the Assembly who were to be chosen. Their opponents—Monarchists, Imperialists and Boulangerists—were badly demoralized by the previous triumph of the Government. The new Chamber of Deputies will consist of 365 Republicans against 211 opposition members, including the members from the colonies. The Republicans comprise 238 Moderates and 126 Radicals; while the opposition consists of 106 Monarchists; 58 Imperialists and 47 Boulangerists. Of the 576 members 287 belonged to the last Chamber; 43 were members of former Chambers, and 239 are new men. Having no further use for a man "in the soup," the Loyalists and Bonapartists have severed their connection with Boulanger, and many of his own most prominent adherents have repudiated him, and call themselves "Revisionists," a revision of the constitution having been the chief "point" in Boulanger's "platform." The financial backers of the late "Man on Horseback" have withdrawn their support, and he has gone to the Island of Jersey for economy's sake. The future looms black for him, but the French are the ficklest people on earth, and as "it is the unexpected that happens" in France, he may yet swing or be hoisted into the saddle again. At present the Republic appears more firmly established than at any former period of its existence..... Barbed wire fencing has been found very efficacious for fortifying entrenched positions in Germany.....Henceforth every branch of the German cavalry will be armed with the lance as its chief weapon; though neither the sword nor carbine will be discarded.....The Paris International Exposition has been the most successful ever held anywhere, in spite of the active or dormant opposition of every monarchial government in Europe, which were opposed to it on the ground that it represented the throne-overturning French Revolution, inaugurated 100 years ago by the destruction of that infamous prison-fortress, the Bastile. The Eiffel Tower as a success has even exceeded Buffalo Bill and his Indians. Its receipts since the opening of the show, on May 15, have been over 5,000,000 francs.....The King of Siam arrived in Paris Monday..... "The O'Donohue" of the Glens, who was in Parliament from 1857 to 1885, is dead..... .....The world is tremendously busy just now building very expensive war vessels. Sixty of the monsters in all were launched last year and 100 were on the stocks at its close..... The London Bread Trust, or union of bakers, expects to make 20 per cent. per annum on a capital of $2,500,000.....Spain is being encouraged by all the prominent European governments to get up a Congress of all the Spanish-American States, to be held at Barcelona or Madrid, as an offset to the Pan-American Congress now junketing in this country.....The complete success of the dock strikers in London has stimulated dock workers elsewhere to strike also. Those at Cardiff, Wales, have compromised. In a big strike of the same sort at Hamburg, Germany, and another at Flensburg there are no signs of settlement. Laborers brought from other places are clumsily doing the work, protected by strong guards of soldiers, a considerable number of whom are also taking the strikers' places. The other day a lot of striking German miners got an increase, which raised their wages to $4.50 per week—quite big wages for workmen in the Fatherland.....

AGRICULTURAL NEWS.

SATURDAY, October 12, 1889.

CONSUL GRIFFIN, of Sydney, N. S. W., reports to the State Department at Washington that both New South Wales and Victoria contemplate sending commissioners to the United States with the view of inducing the latter country to assist in establishing a line of fast steamships between the Australian colonies and the ports on the Atlantic coast of the United States to develop the export of Australian wool to this country. The total export of wool to the United States direct from Australasia during the season of 1888-89 was 38,240 bales, of 400 pounds each, against 21,813 bales for the previous season. During the past year 456 American Merino Sheep were imported into New South Wales by the way of London, as the quarantine laws of the colonies forbid importations direct from America. The reason given for this is that the animals may have the benefit of inspection by experts in London. Consul Griffin says the visit of Hon. W. G. Markham, president of the Wool Growers' and Sheep Breeders' Association of New York, to Australia, has been the means of attracting very general attention to the benefits to be derived from the introduction of high-class American sheep. Indeed, it is almost impossible to take up an Australian journal without finding the merits of these valuable sheep discussed. Mr. Markham introduced the Vermont Wrinkled Merino in 1880, with the firm conviction that the breed would be of great value to the Australian stock. At the annual show of the Denliquin Agricultural Society held last June, the principal prizes were carried off by the sheep of the American and Australian cross. The judges in awarding the prizes stated that these fleeces were unsurpassed in length of staple, luster, density and firmness. The number of sheep in Australasia at the close of 1888 was 96,487,811, valued at $156,519,312. The annual leap was 20,770,293, valued at $40,241,124, and the wool clip for the year was 458,451,710 pounds, valued at $74,368,505..... Stockmen in Southeastern Wyoming are reported to have suffered heavily from the depredations of wolves and coyotes upon calves and colts.....A New York milk-dealer was sentenced to pay a fine of $100 for selling adulterated milk, besides being severely denounced by the judge..... Chairman Sledge, of the National Cotton Committee, with other leading alliance officers, has recommended a meeting of the Cotton Exchange in St. Louis contemporaneous with the National Farmers' meeting in December.....Haaff, the dehorner, has gone into the business of despavining, de-curbing and de-ringboning horses.....It is said that the upper Missouri country will not ship over two-thirds the number of cattle shipped last year, on account of the heavy losses of cows and calves on the ranges in 1887..... Bernard Levy of this city, a milkman who has already paid over $500 for selling adulterated milk, was arrested for the fourth time the other day. He was probably trying to make enough to pay his fines..... ....Last week, two solid trains of 48 cars loaded with raisins left California for the East. California's resources as a fruit supply seem to be unlimited.....A young Iowa farmer has invented a steam binder which is said to have worked well..... Iowa is reported as having an enormous crop of apples and melons, and a good crop of sweet potatoes. Next we know, she will have a boom on hand.....Destructive prairie fires are reported from Iowa, Wisconsin, and other parts of the West. Much hay and grain in stacks, and in many cases farm buildings have been destroyed... In addition to the Exposition awards, the Ministry of Agriculture of the French Government have awarded the Whitman Agricultural Co. of St. Louis, a special gold medal for the great superiority shown at the Noiselle field trial of their hay-press over all competitors.....A Southern New Jersey peach grower comes to the front with a certain cure for the yellows. He has a fair crop of peaches this year, while his neighbors have none. He says that his remedy never fails, and that he intends to bring it before the public shortly. "It is too valuable to give away," however. .....The farmers in Stevens County, Kansas, have suffered four successive failures of crops, and are without the means of support for the approaching winter. They have issued an appeal for help which has been indorsed by the Governor..... Farmers in several Western States are reported to be holding on to their wheat in anticipation of higher prices; more than two-thirds of it is said to be still in the growers' hands.....There was frost in Mississippi and Alabama on Monday night. This is the earliest for many years..... The boiler of a thrashing engine exploded near St. Cloud, Minn. on Monday, severely injuring several men. This is a duplicate of several reports from different localities.. .....Last week's total shipments of live stock to foreign ports from New York consisted of 3,792 cattle, and 122 sheep with 10,430 quarters of beef. Boston shipped 2,000 cattle and 7,082 quarters of beef; Baltimore 3,848 cattle, and Philadelphia 490 beeves and 2,000 quarters of beef. Prices of American beef are well sustained in England....

Crops & Markets.

SATURDAY, October 12, 1889.

THE GRAIN MARKET is very quiet. Wheat shows an upward tendency, while reports from the winter-wheat belt indicate a large part of the crop still in the growers' hands, who are inclined to sell at present prices only as ne essity compels. The fall seeding has generally been heavier than in recent years, except in certain localities where drought has prevented proper preparation of the soil. Corn and oats show a downward tendency in price.

POTATOES are in large supply in this city, and are large and of excellent quality. The price is well maintained, however, as the demand is good. Sweets are plenty and a trifle lower in price. Prime Virginias are worth $1.50 per barrel, with Jerseys ranging higher. Turnips bring a good price at present, $1.50 to $1.70 per barrel. Onions and other vegetables show little change.

APPLES are coming forward quite freely, but there are very few prime lots. Nice red apples well assorted and packed are in good demand, but other grades are neglected. The Southern trade take a good many apples and they require red fruit, Baldwins usually satisfying their requirements as well as any.

Messrs. J. C. Houghton & Company, Liverpool, cable that in their market American apples are in good demand, at the following prices for sound fruit: Baldwins, $2.68 to $4.87, Greenings, $3.16 to $3.65.

Messrs. James Lindsay & Son, Glasgow, cable their market as follows: Greenings, $3.40 to $3.89; Baldwins, $4.13 to $4.85; Kings, $4.85 to $5.83; Ben-Davis, $4.62 to 4.85. The shipments to October 5, 1889, aggregate about 43,000 barrels, against a total to same date last year of about 175,000 barrels, a difference in favor of last season of about 132,000 barrels. This week the shipments will probably be heavier than heretofore, the market abroad having improved and the late varieties of apples being in condition to ship.

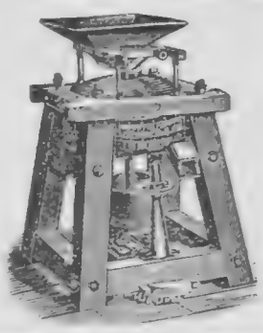
FARM MILLS
OF FRENCH BUHR,
Twenty-eight Sizes and Styles.
FACTORY ESTABLISHED 1851
WARRANTED
MILLS for grinding ear corn, shelled corn, corn and oats, buckwheat and rye. A BOY CAN OPERATE and keep in order. A complete mill and sheller for less than $100. REDUCED PRICES **for Fall of 1889** OVER 20,000 IN USE. Received **Highest Awards** at St. Louis, Cincinnati, New Orleans and Indianapolis fairs and Expositions. Send for Book No. 18—interesting and valuable. Mention paper, and address
Nordyke & Marmon Co., Indianapolis, Ind.



The Syracuse Nurseries!
Old and Reliable.
Are growing the Largest and most Complete Assortment of Nursery Stock in America. In BUDDED APPLES and STANDARD PEARS they acknowledge no competition—quality considered. Nurserymen and Dealers will consult their own interests by getting prices on this Superb Stock before buying. Special inducements to buyers in large quantities.
SMITHS, POWELL & LAMB, SYRACUSE, N. Y.

THE SCIENTIFIC GRINDING MILL
GRINDS EAR CORN with or without Shucks on and all small Grains, **in fact everything which can possibly be utilized for feed.**
SAFETY BOTTOM and other Practical Devices to prevent breakage should iron accidentally get into Mill.
GRINDING PLATES reversible, self-sharpening, double the capacity of all others. Sold on trial. All Mills fully guaranteed. Simplest, lightest running, strongest, fastest grinding. Send for circulars.

Literary.

MAGAZINE REVIEWS.

SCRIBNER for September has an article by Prof. Shaler of Harvard on "The Common Roads." These were in the primitive periods of history simply trails over which pack-animals transported passengers and freight. The invention of wheeled vehicles necessitated better roads. The Romans were the first to build good carriage-ways. Great Britian and Switzerland have the best roads of the European countries. The United States are most poorly provided with roads of any country of equal area and general culture, owing to their abundant means of water communication and the rapid construction of railroads. The author must have had personal experience in the common American method of road repairing, as he graphically describes the "annual road-making picnic." He says it is probable that the sum of the road-tax in this country, taking into account the execrable roads commonly found, is greater than that of our ordinary taxation. To remedy this state of things, the agricultural colleges should teach road-making; the work should be done by the township or county governments, thus permitting the utilization of machinery now inaccessible. Numerous suggestions are offered in relation to improving the country roads on different soils. "Electricity in War" is discussed by Lieutenant W. S. Hughes of the United States Navy, in its relation to Naval Warfare, and by Lieutenant John Mills, of the U. S. Army, in its relation to Land Warfare. The uses to which it is put are numerous. It is used in the powerful search-light; for signalling between vessels long distances apart; for torpedo detectors; firing large guns; estimating the speed of ships; exploding torpedoes, etc. Indeed, it seems well-nigh impossible to imagine any mechanical work to which it cannot be applied. By its aid the speed of a cannon ball may be ascertained. A torpedo has been invented which may be sent out over the water, guided and propelled from the shore, and exploded at will or automatically upon striking the enemy's vessel. Donald G. Mitchell under the caption: "A Scattering Shot at Some Ruralities," gives some observations among some of the depopulated and decaying New England villages and farms. Two stories of travel are: "A Summer in Iceland," and "How I Crossed Masai-land." There is the usual proportion of fiction. Charles Scribner's Sons, New York.

LIPPINCOTT'S space is largely occupied by the novel "Creole and Puritan," by T. C. DeLeon. Anne H. Wharton essays an answer to the much mooted question: "What Shall be Our National Flower?" She favors the goldenrod. "The Trials of Magazine Editors" are vividly portrayed by Junius Henri Browne. They evidently have to suffer a great deal from over-ambitious authors, or would-be authors, but the writer is constrained to exclaim: "The trials of the editor are certainly manifold and peculiar, but less serious and harassing than those of writers." The publishers have added a new department: "With the Wits." While some of the humorous hits are very good, some give the idea of being made to order out of very scant materials. Some of the most interesting departments have been dropped, and this issue is not, with the possible exception of the novel, equal to the usual standard. J. B. Lippincott & Company, Philadelphia.

THE WRITER has quite an argument from a woman in favor of the addition of the termination "ess" to the title of a woman who engages in professional or mechanical occupations. If she essays to heal the sick, she should be known as a doctress, or rather a physicianess; if she would climb higher and erect a mansion wherein to dwell, she becomes a carpentress, or, excuse the slip, a buildress, as carpenters are somewhat out of date. Should her inclinations lead her to till the soil, she would become a farmress. She might also become a cookress, a bakress, an editress, a conductress, and so on *ad libitum*. Don't let us have any half-way business about this reform! There is considerable good advice in "About Handwriting," which we would be glad to see followed. "Queries" contain much interesting information. The Writer, Boston.

BOOK REVIEWS.

WE ARE in receipt of the "Album of Agricultural Statistics of the United States" from Hon. J. M. Rusk, Secretary of Agriculture. It contains 16 maps of the United States each presenting a separate topic, *e. g.*: Percentage of unoccupied and of farm lands comprising the superficial area of each State. Acreage of corn, (and wheat and oats on separate maps) per 1,000 acres of superficial area in each State. Average values of each kind of live stock in each State. Average value of lands in the United States, etc. An outline map is presented, in each case, showing the boundaries of the several States, and by means of the different colors, the facts to be presented are instantly conveyed to the eye, imparting the desired information much more quickly and readily than could be done with statistical tables. To illustrate: one map contains in each State a semi-circle in four colors: one color represents the comparative area of tillage lands, another the grass lands, a third the woodland, and the fourth the unproductive lands. A glance shows the comparative area of each in the different States. The album is a new departure in statistical work, and is a very interesting, and at the same time valuable addition to statistical literature. Department of Agriculture, Washington, D. C.

THE ENGLISH FLOWER GARDEN. A new edition of this very entertaining and valuable book is just at hand, and in it numerous changes appear. In noting these, the author, W. Robinson, Editor of "The Garden," "Gardening Illustrated," etc., asserts his belief that any book with a useful aim would be bettered were the author compelled by law "to keep to it and mend it all his life." One avowed purpose of the book is to destroy the notion that a flower-garden must be of set pattern and placed at one side of the house. For the benefit of those of our readers who may not be familiar with the first edition, we may say that the book forms volume I. of the Garden Cyclopedia, two parts. Part I. consists of a description of some of the best typical English gardens, and discussions of hardy plants and ways of arranging them; climbers; Alpine and rock gardens; spring, autumn, and fragrant flowers; color in the flower garden; roseries; wasted efforts; etc. Part II. gives full descriptions of all the best plants for the garden. Mr. Robinson pithily says: "Select only good plants; throw away worthless kinds; there is no scarcity of the *very best*." The book is written in the interest of out-door plants only—hardy and half-hardy—and pays no attention to bedding plants. Unlike most English works, this is almost equally valuable to the American and the English gardener. Profusely illustrated and indexed; cloth, green and gold; 6x9; 832 pages. John Murray, Albermarle Street, London.

Indust'l Societies.

BAY STATE AGRICULTURAL SOCIETY.

(RURAL SPECIAL REPORT.)

THE Third Annual Cattle Show and Fair of the Bay State Agricultural Society was held in Mechanics' Building, Boston, Mass., from the 7th to the 12th of October. It was in all respects the best and most successful agricultural exhibition ever held in the East. On the main floor of the exhibition hall directly as one entered the building, were the flowers and shrubs, flanked on one side by long rows of tables loaded with vegetables, and on the other by similar tables covered with fruit. The gallery was filled on one side with the poultry exhibit and on the other with implements. One of the side rooms was appropriated by the ladies and was well filled with various articles of domestic manufacture. The other side room was used by the Grangers. On the central bridge of the gallery, Mr. Ellis of Norwood, had a fish hatchery, where the process of hatching fish from the spawn was carried on. The spawn used was that of the carp, and the young fish in all stages of development were shown. The sides of the main hall were filled with agricultural implements. In the center was located the show-ring, while the bands were located on the stage surrounded by a perfect wilderness of trees and shrubs.

Along the rear of the buildings an annex was erected for the swine, and adjoining it were the sheep pens. The exhibition of both sheep and swine was in many respects the best ever seen in New England. The horses and cattle were kept in stalls in the basement when not in the show-ring on the main floor.

On the whole, the fair was an unqualified success. Naturally it was compared, not with the fairs of other societies, but with the great fair of two years ago held by the society in the same building. The verdict seemed to be that while the arrangement of the exhibit was better, the average character of the articles shown and the general appearance of the exhibit were about the same. The working dairy attracted much attention and will be described in a separate article. J. H. G.

THE LADIES' HOME JOURNAL

For OCTOBER contains the opening chapters of

MAUD HOWE'S Society Novel, "PHILLIDA."

"Phillida" is a story of English society life, written by one who thoroughly knows her ground. With her distinguished mother, Mrs. Julia Ward Howe, Miss Howe lived for some time in England, and her talent and beauty made her eagerly received among the very best people. She has made good use of her rare opportunities, and has studied the charms and foibles of English society with a keen and impartial eye. The heroine is an American girl who goes to England and creates a furore in London society.

FLORENCE HOWE HALL contributes another paper on "*Affectations and Inelegancies of Speech.*"

SUSAN COOLIDGE writes a splendid story for the girls—"*A Coming Out*"—treating of a young girl's training for a society "coming out."

"A New York Woman of Fashion."

Pen portraits of a dozen well-known society women of New York. Written by one of the "four hundred."

MARGARET E. SANGSTER contributes one of her graceful poems—"*In the Night Season*"—beautifully illustrated.

"Forgotten Graves of Famous Authors."

by EDW. BOK. One of the most interesting papers ever published.

All Hallow Eve—a nutting shake and other games. Illustrated.

Autumn Brides and Brides Maids—with other fashion matter complete. By our own Mrs. JOHN W. BISHOP, now in Paris, furnishing the latest news in Styles, Novelties, etc., for *The Ladies' Home Journal.*

Other features are "*Nursing in Fevers*," by Mrs. A. R. RAMSEY. "*Practical Home Dress Making*" by EMMA HOOPER. "*Flowers and House Plants*," by EBEN E. REXFORD. "*English Meat Teas.*" "*Talks with the Doctor*," etc.

The Ladies' Home Journal is the ideal home periodical for Christian, cultivated families. Pure in tone, never sensational, always an unobtrusive moral in its fiction, and always helpful and practical. It employs the most distinguished writers and artists, and is filled with the best obtainable *original* matter. Is always *new*, *fresh*, and attractive by its handsome printing and illustrations. It is read by *everybody*; at least it has nearly half a million subscribers and buyers, a larger circulation than any other periodical, which shows its great popularity.

The October Number is ready on the news stands, and **costs but 10 cents a copy. A Three Months Trial Subscription may be had for only Twenty-Five Cents,** sent direct to the publishers.

For ONE DOLLAR we will mail The Ladies' Home Journal from now to January 1st, 1891—that is the balance of this year—FREE, and a FULL YEAR from January 1st, 1890, to January 1st, 1891.

CURTIS PUBLISHING CO., Philadelphia, Pa.

CATARRH
HAY FEVER
CATARRHAL DEAFNESS

A NEW TREATMENT.

Sufferers are not generally aware that these diseases are contagious, or that they are due to the presence of living parasites in the lining membrane of the nose and eustachian tubes. Microscopic research, however, has proved this to be a fact, and the result of this discovery is that a simple remedy has been discovered which permanently cures the most aggravated cases of these distressing diseases by a few simple applications made (*two weeks apart*) by the patient at home. A pamphlet explaining this new treatment is sent *free* by A. H. DIXON & SON, 337 and 339 West King Street, Toronto, Canada.

COLCORD'S SYSTEM OF PRESERVING GREEN FORAGE.—The R. N.-Y. is glad that Mr. Colcord has prepared this volume. In many respects it is the most important publication relating to ensilage that has appeared since Mr. Goffart began the literature of the silo. We have described this "patent system" of making silage so frequently that most of our readers know what it is. For the benefit of those who have not given the matter much thought, we may say briefly that Mr. Colcord conceived the idea of preserving green forage, corn, clover, it matters not what, without any fermentation. The ordinary silo is a tight box or room in the building, drainage of which is carefully avoided and outside air is guarded against. The material with which the silo is to be filled is thrown in and permitted to heat up to a high temperature. This high heating is considered beneficial, it being asserted that after a certain degree of heat is reached the product cools down, the ferment germs being destroyed. The high heat produced in these silos has led the owners to compare their silage to preserved fruit. Now Mr. Colcord believed that this heat was not necessary. Quoting from Mr. Goffart, he says: "The end to be attained is to prevent all kinds of fermentation. Fermentation preserves nothing; on the contrary, it is always a preliminary step towards a decomposition more or less putrid; towards a real destruction." What does he do, then, to take the place of what the scientists advocate in the way of "killing heat?" A strong, air-tight silo is built much like those used by the high-heat people. There are strong beams placed above it to render it possible to produce a strong pressure. At the bottom is an opening with pipes leading to the outside. A device called a silo governor fits to this opening at the bottom of the silo. This governor is the characteristic feature of the system. It comprises a series of connected perforated pipes so arranged that they branch all about through the silo. The cut corn is thrown into the silo in the usual way—down among these perforated pipes. When the silo is full it is covered with an air-tight cover and powerful jack-screws are placed under the heavy beams and worked so that the cover is pressed powerfully down. Then, as can be readily seen, the juice and water in the silage—all the substances that might cause heat and fermentation—are pressed into the perforated pipes and can be drawn away at the outside. The product left is not "silage" as most people recognize that substance, but "preserved green forage." Mr. Colcord, in this little volume, gives all the details of his system and explains it at length.

As to the merits of his system, it is evident that, counting the cost of the governor and the labor required in adjusting the pipes and working the screws, the patent silage will cost more per ton than the common product. Is it worth more per ton after it is made? That is the question. The R. N.-Y. fully believes it is.

DAIRY EXPERIMENTS AT THE NEW JERSEY STATION.—Bulletin No. 57 of this station outlines some experiments that are now under way to test the relative merits of different breeds of cows. Three cows of each of the following breeds, Ayrshire, Guernsey, Jersey, Holstein-Friesian and Short-horn, are being fed and milked together somewhat after the plan followed at the Geneva, N. Y., Station. The food and milk are frequently analyzed. At the end of the year it will be possible to tell how much each cow has eaten, how much milk she has produced and how her milk compares in value with the standard. It can be readily seen that such a test will prove very interesting when it shall have continued long enough to give a fair basis for calculation.

PETER HENDERSON & COMPANY, 35 & 37 CORTLAND STREET, NEW YORK.—Autumn catalogue of bulbs for fall planting, plants for winter flowering and seeds for fall sowing. Handsomely illustrated. Besides hardy bulbs, roses, a large collection of chrysanthemums, hardy shrubs and small fruits are catalogued.

STRAWBERRIES FOR CANADA.—Bulletin No. 5 of the Experimental Farm at Ottawa, Canada, is devoted to strawberry culture. The most economical methods of culture are given and an excellent list of varieties with the characteristics of each.

THE MURRAY HARNESS.—The R. N.-Y. again calls attention to the catalogue of the Wilbur H. Murray Company of Cincinnati, Ohio. The prices given for all sorts of harnesses and buggies are certainly surprising. So far as the R. N.-Y. can learn, the goods are of such quality as to make the offer a remarkable one. This is the year for economy. Buy at headquarters and save all you can.

CREOSOTE STAINS.—Circular from Samuel Cabot, 70 Kilby Street, Boston, Mass. There are seven reasons why these stains are worthy of use. They preserve the wood, they are less expensive than paint and at the same time just as durable, the coloring effect is more beautiful than that of paint, the stains decrease the combustibility of the wood, they are more easily and quickly applied than paint and will stand the weather better. A novel device is adopted for advertising the stains. Pieces of wood stained in different colors are sent to those who desire to investigate the merits of creosote stain. You had better send for them.

A STUDY OF WINDBREAKS IN THEIR RELATION TO FRUIT-GROWING.—Bulletin No. 9, September, 1889, from the Experiment Station at Ithaca, N. Y. In this bulletin Prof. Bailey has adopted the "Symposium" plan of giving information. The pamphlet presents the views of 79 well known fruit-growers, with comments and elaborations by Prof. Bailey. The arrangement of the answers is most admirable and the conclusions and arguments are forcibly and clearly given. In fact, this bulletin is a model for clearness and pithiness. Prof. B. says that while the best horticultural writers are nearly unanimous in recommending windbreaks for all fruit plantations, there is, nevertheless wide difference in opinion and practice among good cultivators concerning them. Fruit-growers, as a rule, either wholly oppose shelters or positively advocate them. It was because of this difference of opinion that the "symposium was organized and prepared." Prof. B. gives the following "general summary" of the points made by his correspondents.

1. A windbreak may exert great influence upon a fruit plantation.

2. The benefits derived from windbreaks are the following: protection from cold; lessening of evaporation from soil and plants; lessening of windfalls; lessening of liability to mechanical injury of trees; retention of snow and leaves; facilitating of labor; protection of blossoms from severe winds; enabling trees to grow more erect; lessening of injury from the drying up of small fruits; retention of sand in certain localities; hastening of maturity of fruits in some cases; encouragement of birds; ornamentation.

3. The injuries sustained from windbreaks are as follows: Preventing the free circulation of warm winds and consequent exposure to cold; injuries from insects and fungous diseases; injuries from the encroachment of the windbreak itself; increased liabililty to late spring frosts in rare cases.

a. The injury from cold, still air is usually confined to those localities which are directly influenced by large bodies of water, and which are protected by forest belts. It can be avoided by planting thin belts.

b. The injury from insects can be averted by spraying with arsenical poisons.

c. The injury from the encroachment of the windbreak may be averted, in part at least, by good cultivation and by planting the fruit simultaneously with the belt.

4. Windbreaks are advantageous wherever fruit plantations are exposed to strong winds.

5. In interior places, dense or broad belts, of two or more rows of trees, are desirable, while within the influence of large bodies of water thin or narrow belts, comprising but a row or two, are usually preferable.

6. The best trees for windbreaks in the Northeastern States are Norway Spruce, and Austrian and Scotch Pines, among the evergreens. Among deciduous trees, most of the rapidly-growing native species are useful. A mixed plantation, with the hardiest and most vigorous deciduous trees on the windward, is probably the ideal artificial shelter belt.

SYSTEMATIC TESTING OF NEW VARIETIES.—In Bulletin No. 8 of the Pennsylvania Station, Prof. Geo. C. Butz announces that the station is prepared to test novelties, in the way of vegetables, flowers or fruits. The station will not, of course, offer any of these novelties for sale; the originator's right is fully understood. The desire of the station is merely to test the plants accurately by the side of dozens or hundreds of other varieties. Originators will do well to communicate with Prof. Butz.

Law.

"Every Man is presumed to know the Law. Nine-tenths of all Litigation arises from Ignorance of Law."

COST OF DIVISION FENCES IN NEW YORK.

S. T. L., Kingston, N. Y.—My neighbor has a building 100 feet long on his line. I have a building 75 feet long on my line. Both lots are about 150 feet long. If I build a fence to the end of my land must my neighbor pay half? If he says that the fact that his building is 25 feet longer than mine saves me 25 feet of fence, must I contribute half the cost of the whole fence including the wall of the building for 25 feet?

ANS.—Outside the incorporated cities and villages of this State, half the expenses of a division fence is borne by the owner of each of the pieces of property between which the fence runs, provided each owner has his property inclosed. If either owner leaves his property uninclosed, he need not contribute towards the fence until such time as he sees fit to inclose his premises. In incorporated cities and villages the question is generally settled either by the charter or by ordinance; but in all cases, so far as we know, the expense is shared substantially as under the general law. The owner of adjacent premises is not, however, obliged to contribute towards the cost of the wall of a building because it partially replaces a partition fence.

LAW OF INHERITANCE IN TENNESSEE.

L. S. M., Jacksonville, Fla.—A in common with four brothers and sisters owned valuable land in Tennessee inherited from his father. A moved to Florida, married there and died, leaving a widow and one child. The child died in infancy—12 months after the father's death. What interest does the widow inherit in the land? What interest, if any, did the child have in it? If the child had an interest in the land, to whom does it descend?

ANS.—Under the law of descent in Tennessee, upon the death of a husband, the wife is entitled to a life interest in one-third of the real estate, and the remainder goes equally to the children. On the death intestate of an owner who leaves no issue, and no brothers or sisters, or their issues, as was the case with the child under consideration, the real estate goes to the surviving parent. Accordingly, in the present case, the whole of the husband's interest in the real estate in Tennessee, vested in the widow upon the death of her only child.

T. L. H., Queens County, Long Island, N. Y.—What birds can be legally shot in this county from now until the end of the season?

ANS.—Wild ducks, geese and brant may be killed in any other part of the State, from September 1 till May 1; but in the waters of Long Island, they may be killed only between October 1st and May 1st. Woodcock may be killed on Long Island between August 1 and January 1, and prairie chickens between September 1 and January 1. Robins and blackbirds may be shot on Long Island between November 1 and January 1. Snipes and plovers July 10 to January 1. Rail-birds September 1 to January 1. It is a misdemeanor at any time to kill song birds or any other than game birds except for scientific purposes; but English sparrows are not protected by the act; and, indeed, it is a misdemeanor incentionally to give them food or shelter. Neither are crows, hen-hawks and owls protected by the act. Night hunting and the use of artificial lights, or pivot or swivel guns or nets is prohibited.

FRUIT TREE QUESTIONS.

Trees on Light and Heavy Soils.

GRAFTING A VARIETY ON ITS OWN SEEDLINGS.

An Early Variety on a Late One.

PAINT FOR TREE INJURIES.

The following notes are written in answer to these questions, which were sent by a subscriber in California:

1. *Is it advisable to graft any variety of tree on sprouts raised from its own seed?*
2. *Would it injure tree or fruit growth to grow an early-fruiting or maturing variety on a very late one?*
3. *Will not common paint be a preventive of injuries to tree bodies from mice and insects?*
4. *Is it possible that a tree or fruit will grow 'equally well on light as heavy soils,' as claimed by some?"*

FROM T. H. HOSKINS, M. D.

1. There is no reason to believe that any ill result would follow the grafting of cions from any tree upon seedlings of the same tree, if of sufficiently vigorous growth. There is some theoretical presumption in favor of it, since there would be a probability of close resemblance in habit of growth, and therefore less likelihood of either cion or stock overgrowing the other.

2. As a rule, no. Yet, as there are certainly cases where grafts upon a slow-growing stock from a tardy bearer are forced into early bearing, so it is possible that in some cases grafting an early sort upon a late sort might have some retarding effect upon the maturity of the fruit. Yet in large orchards grafted upon miscellaneous stocks, few if any striking instances have been observed.

3. Possibly; but I should not regard it as safe, unless annually renewed. The best and cheapest protection is to tie thin slips of wood (lath, waste veneer, old shingles, staves, or clapboard), around the trunks. I have practiced this for 20 years without losing a tree, at a cost of less than one cent per tree, annually.

4. Yes, it is quite possible, as is shown by fine orchards on both sorts of land. But though this is often true, especially with apples and pears, there is a choice to be made, when possible. Thus, the quince cannot be grown with assured profit on light soils; and the foreign plums and their seedlings also do much better on strong land. On the other hand, cherries, and our native plums thrive best on the lighter, gravelly soils; and the same is true of the peach. But whatever the soil, it may be so amended and improved, by skilled culture, that a very large assortment of tree fruits can be grown on a limited area with reasonable success, so far as the soil itself is concerned. It must be remembered that climatic influences will also have to be considered, since results are not dependent upon soil or culture alone.

Orleans County, Vt.

FROM P. M. AUGUR.

1. If the inquirer means a variety in its true sense, I would say: "No." If he means to graft a seedling upon seedling stocks of its own species I would say: "Yes." Thus the pear will grow upon the thorn, the Mountain Ash, the apple and the quince; but in general it does best upon the pear, and for general orchard purposes it should be so worked; but it is not important to go closer than that by working it upon seedlings of its own variety.

2. I should say in general: "No," and yet the character of the stock does somewhat modify the time of ripening and the quality of fruit. For instance, the Roxbury Russet grafted upon the Golden Sweet, which is early in ripening, is modified both in flavor and, sometimes at least, in keeping qualities. Therefore seedlings of some late, hardy keeper would be better in general than seedlings of a very early variety.

3. I should say emphatically: "No." Oil paint in general I think injurious to trees. Better use a decoction of tobacco stems and soap in the right proportions, applied in a lime wash, with sulphur added. This will be excellent in cases of black, gummy exudations on the peach or cherry, and will indeed be safe and useful always. A conical mound of earth or coal ashes will protect against mice.

4. Here the law of adaptation comes in. Some varieties seem best adapted to heavy, others to light soils. It is safe and wise to learn what varieties have proved best in any given locality, and with similar soil, climate and surroundings one should use the successful kinds. No one rule of universal application can be given.

Middlesex County, Conn.

FROM A. W. SIAS.

1. I shall take the affirmative of this question for the following reasons: 1. Because my experience teaches me that the greater the similarity between the stock and the cion, or graft, the better the result. 2. I contend that it is not advisable or practicable to graft anything but seedlings. To explain: if a greater number of Baldwins or Greenings are wanted one should, first, sow the seeds of these varieties and when the young trees are one year old graft the Baldwin seedlings with Baldwin cions, Greening seedlings with Greening cions, etc., making it a point that the stock and graft, or cion must be near relatives, and, unlike the occasional results of the union of first cousins in the animal kingdom, there will be no fools. I contend that where the stock and graft are near relatives they will have a similar cell structure with a cell caliber in the stock about the same as in the graft; hence the stock will not carry up sap to the graft faster than it can be properly utilized, and so that abnormal beetle-like deformity so common in case of the union of different species and distant relatives will not be produced. 2. My experience leads me to take the negative side of this question. Perhaps the greatest disparity in season of fruit maturity with the union of two varieties with which I have experimented is in the case of the Flemish Beauty Pear on the June-berry. Now while it is a well attested fact that this union will dwarf both the pear and June-berry stock to a considerable extent, it is not clear to me that it dwarfs the fruit of either stock, or that it dwarfs or shortens the life of either plant owing to the inequality of the time of the ripening of the fruit.

3. Yes; but to what extent can we use this preventive without injury to the tree? Will some one explain?

4. The largest and most rapid-growing trees I have yet seen were on light soils, and where the water supply and other necessary conditions were not wanting; but where droughts are frequent and the mercury ranges very low, I would prefer heavy soils every time.

Olmsted County, Minn.

FROM W. M. BENNINGER.

1. It is not neccessary to graft or bud on stocks grown from seed from the same variety of fruit; it is better to use seedlings from wild or hardy fruit; and budding on one-year-old stock is the best. However, apples do best on apple roots and pears on pear roots and so on; budding on other classes of fruit is not advisable. The only extensive change made is in case of the pear on the quince for dwarfing purposes and only a few varieties are successfully worked in this way, and the standard or a pear on a pear is preferable.

2. I am of the opinion that an early apple grafted on the top of an old tree of a very late variety would, for the first few years' fruiting, ripen later or that it would resemble the original trees in some respect; but a change will occur as soon as the sap is uniform to the graft on top. Young trees will hardly ever mature their fruit the first year in bearing, and if they do so in any case, I think it is due to the natural root, but they generally mature their fruit the second year in bearing.

3. Paint would injure the trees; it would close the pores and harden the bark. I find soft-soap suds the best wash for young trees. The bark of a tree must be kept soft and smooth, and the best way to keep it so is by cultivation and fertilizing. Very old trees with rough and old bark may be white-washed once in a great while, but this should not be repeated, as it would injure the bark.

4. All fruits succeed best on heavy soils. Peaches and sweet cherries can be grown on light gravelly soils and they will bear better if well fertilized and cultivated.

Lycoming County, Pa.

FROM E. WILLIAMS.

1. I take the term sprouts to mean seedling stocks and cions. If so, the question is too broad a one to admit of an affirmative answer. When a youth, I planted a lot of apple seeds selected from one of our hardiest and most reliable sorts, thinking thereby to obtain a more hardy constitution to start with than by using a promiscuous lot of seeds of whose antecedents I knew nothing. The seedlings showed, as all seedlings will, considerable variation in vigor of growth—some being much stronger and more vigorous than others, while some were so weak as to be rejected as unfit for budding. Most of these stocks were budded to different varieties; many of them to the variety which produced the seed. I do not know that these made any better trees than other stocks would have made; but I certainly cannot see any objection to such a course, or do I believe there is anything wrong in it; but it is not always practicable, especially in large nurseries, and even if it could be demonstrated that it is advisable, it would enhance the cost of such trees beyond their value for commercial purposes. I think the laws of heredity have much to do with the health and longevity of trees—more perhaps than we generally suppose—and I should expect to secure a larger percentage of healthy, long-lived trees from seed of our native apples and pears than from our modern and more highly improved kinds; but I have no facts in my own experience fully to confirm this idea. We have in all this region native pear trees that are, perhaps, a century old. In their natural condition they bear a hard, austere winter fruit, only fit for cooking; but I have never seen one of these trees in its natural condition, or grafted to other kinds, that exhibited a symptom of pear blight; hence I conclude that seedlings from these trees would make admirable stocks on which to work our more improved varieties, and I believe they would possess a hardier constitution than stocks grown from seeds of the latter. As our fruits advance and improve in quality, there seems to be a retrogression in health or hardiness in about the same ratio.

This correspondent's idea, if applied to cherries, would be a difficult one to pursue owing to the fact that very few seeds of our improved kinds ever perfect themselves, while the native black or Mazzard Cherries almost invariably perfect their seeds, and hence are generally used as stocks for our Heart and Bigarreau varieties.

The idea when applied to peaches would meet with opposition at once, as the universal sentiment among peach-growers is that natural southern peach seeds produce the best possible stocks for this fruit. It is through the seeds of our improved kinds that we must look for and obtain further improvement, and yet I cannot see why a seedling peach tree grown from a healthy Crawford's Late seed would not be as good a stock on which to grow a tree from its parent as one grown from southern seed, unless it might be deficient in some element of hardiness or health. The principle of heredity and in-and-in breeding comes in here; but whether this influence is as potent in vegetable as in animal life, or whether it is totally inert, I have no facts at hand to sustain either side of the question, if such exist. Who knows whether an Early York, or Late Crawford, budded on seedlings of the same, would make less satisfactory trees than if budded on stocks from southern seed? Who knows!

2. There would probably be more or less influence one way or the other, but not of an injurious character. It is often necessary and advisable to graft a weak and crooked-growing variety, like the Winter Nelis Pear, for instance, on a strong and sturdy grower like the Buffum, to aid in overcoming this objectionable feature. A late-maturing variety as a stock for an early-maturing one might have a retarding influence, but it is uncertain, and we have not yet mastered the subtle mysteries of Nature to that extent that we can tell in advance just what to expect from these combinations. Every variety of fruit seems to have its own peculiar qualities well environed, else we should see more changes and variations than we do. Take the matter of color, for instance. Why should not this blending of colors show an influence? If so, we should expect to see the color of a red apple toned down when grown on a stock of a white, green or yellow variety; but it matters not how many different veins the nourishment passes through, the color comes true at last. In speaking on this subject to an old neighbor some years ago, he referred me to his Baldwin grafts set in the tops of Harrison trees, from which he invariably got his highest-colored fruit. The size did not average so large as on other trees, but the color was more intense and it was always so. Why?

3. It would probably prevent injuries from these sources. Paints of various kinds have been recommended and condemned for this purpose; but were I to use them, it would be with caution. Lime whitewash, or whale-oil soap, applied with sufficient frequency, would probably be quite as effective and not at all injurious.

4. Universal experience proves such claims fallacious. Argument to prove the contrary is unnecessary, as abundant evidence of indisputable character exists in almost any locality to show the absurdity of any such claim.

Essex County, N. J.

FROM T. T. LYON.

1. There can be no doubt that all grafting is deleterious to the vigor, health and longevity of the resultant plant just in proportion to the dissimilarity of the stock and cion, and their consequent inability to form a perfect union. The grafting of cions from an unworked seedling, upon sprouts from its own roots, although useless, so far as improvement of either tree or fruit is concerned, insures the most perfect adaptation of cion to stock. A seedling of many species of plants is more or less liable to vary from the parental type, and such variation may be assumed to affect more or less unfavorably its value as a stock on which to engraft the original variety. The results of the use of stocks of the character last indicated may doubtless fairly be assumed to afford occasion for the conviction, so widely entertained, that seedling trees are more hardy and productive than those budded or grafted.

2. Cases are occasionally given in which stocks are alleged to have more or less influenced and modified the season or other qualities of the variety worked upon them. That the stock does frequently, to a limited extent, exert such modifying influence, is doubtless beyond question; but I question whether either the fact of such variation, or its direction or extent, can, in the present state of knowledge of the subject, be determined except by actual trial.

3. Paints, prepared and applied with linseed oil, would doubtless be injurious to trees by arresting transpiration from the surface but for the fact that the oil soon hardens and becomes ruptured by the enlargement consequent upon growth. Although occasionally used with impunity, to destroy insect enemies, it seems preferable to repel mice and similar enemies by the use of a more porous and less dangerous material.

4. Experience has long since demonstrated the fact that most, if not all, classes and varieties of trees possess a limited but variable capacity to adapt themselves to variations of soil; but the fact is equally well established that any given variety or class of tree or fruit, will, other things being equal, reach the most satisfactory results only when its preferences are thoroughly satisfied.

Van Buren County, Mich.

FROM P. BARRY.

1. There is no objection to grafting a variety of fruit on its own seedlings, provided they are healthy and vigorous and suitable for stocks.

2. To graft an early-fruiting variety of fruit tree on a late one, may not injure the fruit, but may retard its fruiting. If the trees grafted upon were of feeble growth, it would naturally unfavorably affect the one grafted upon it.

3. Common paint on the bodies of trees might prevent injury from mice, but would probably kill the trees.

4. Some trees will grow equally well in light and heavy soils, but among fruit trees some succeed better in light and some in heavy soils.

Monroe County, N. Y.

FROM AN OLD FRUIT-GROWER.

1. It is not probable that we should gain anything, on the whole, by procuring seedlings from any variety to graft that variety on. There are some particular kinds, as, for instance, the Buffum Pear, the seedlings of which would be more vigorous like

their parents than the average; but there are others feeble and crooked-growing like the Winter Nelis and Giffard, which would be better grafted on some other vigorous seedlings. Cultivators who are noted for the fine specimens of their fruits, are not indebted for their success to the seedlings they have used, but to rich soil and skillful culture.

2. Trees which mature their fruit early are not distinguished for any uniform characteristic of growth. Some are strong growers and others feeble, and in selecting the seed for the growth of stocks, the best growers should be chosen—not early or late ones.

3. Common paint does well for covering wounds from pruning or accidents; but some composition of the nature of grafting-wax is less liable to scale off, especially near the ground. Either will do well.

4. As a general rule, fruit trees do better on clay soils or strong loams than on light or sandy soils; and a list of such varieties as succeed well on light soils could be made from extensive trials in different localities.

FROM J. S. HARRIS.

1. My experience and observation indicate that a perfect union between graft and stock is essential for the health, vigor and long life of the tree, and that this can be insured only between varieties of any species, that are very nearly allied. Therefore seedlings of a variety would make the most reliable stocks for the variety. Earlier fruiting is often induced where the union is not so perfect.

2. If the varieties are nearly enough allied to make a perfect union, there would be no perceptible difference in the tree or fruit of an early variety grafted upon a late one, and the top would govern the period of activity in the root.

3. Common paint is a protection against insects, but the oil with which it is mixed frequently causes the death of the tree.

4. Some varieties of fruits are adapted to heavy clay, others to loam and others to sandy soils, and those that will succeed on one kind of soil will not do equally well upon any of the others.

Horseman.

HUNTER BROOD-MARE, FLORIMEL.

FIGURE 262 is a re-production from the Live Stock Journal, London, of the Hunter brood-mare Florimel and foal, owned by John Cooper, Brook Hill, East Haddon. She was bred in Ireland, was never exhibited until last year when she won first prizes wherever shown. She won the first and champion prizes at the Royal Show at Windsor the past summer.

Farm Economy.

Marketing Crops.

WHEN, HOW AND WHERE

RURAL READERS SELL PRODUCE.

SOME INTERESTING NOTES.

SELLING is just as important as producing. The business farmer takes advantage of every extra price; his goods are sold at the right time and in just the right condition. We are always interested in knowing how our friends conduct their business, what they have to sell, when and where they sell it, what would induce them to hold their product for a better price, and what they depend on for reports concerning the markets. It is believed that farmers can very profitably compare notes on these matters, so we begin this week the publication of short notes from some of our friends. The present notes refer mainly to farming at the East. Later on we shall have something in the same line to say of Western marketing.

CONNECTICUT.

OF late I have been more of a market-gardener and dairyman than general farmer, so that my large hay and grain crops have been disposed of on the farm, and I find a local market for my garden truck and dairy products. When I formerly sold hay in the New York market, I found October and November to be the best months to sell, there then being a large demand while the market was not crowded. Apples and potatoes I market early if prices are good; for by holding them I find the loss by rot and shrinkage and the cost of rehandling, is not compensated for by the extra price. I depend on the RURAL crop reports to keep me informed regarding the condition of crops in the different parts of the country that rule the New York markets. If there be a surplus and I know that prices will be low when my products would ordinarily get to market I hold them until better prices can be obtained. My daily paper quotes market prices and I am somewhat governed by them. H. D.

Greenwich.

MASSACHUSETTS.

My chief crops are onions and potatoes with some garden truck, all of which are sold at the village one mile distant. The vegetables are sold at whatever time I can best attend to the business. I find market reports in several papers; but rely chiefly on those in the R. N.-Y. and the New England Homestead. In the "agricultural news" and reports of the former, I get a good idea of the prices and condition of crops through the country; and in the latter a thorough knowledge of the amount of crops, and condition of the markets in New England. The prices at Boston to a certain extent control prices here, as our dealers go there for vegetables of all kinds, if the local production is short. Through the summer and fall I read carefully and watch closely all that relates to my chief crops in all parts of the country, and pick up what I can in regard to foreign markets, and if crops seem to be good at home and abroad I sell as soon as I can, as prices here are usually better then than later on when all wish to get rid of perishable crops. If crops are short I hold till mid-winter or spring, for prices advance as the supply grows short. F. L. A.

East Pepperell.

MICHIGAN.

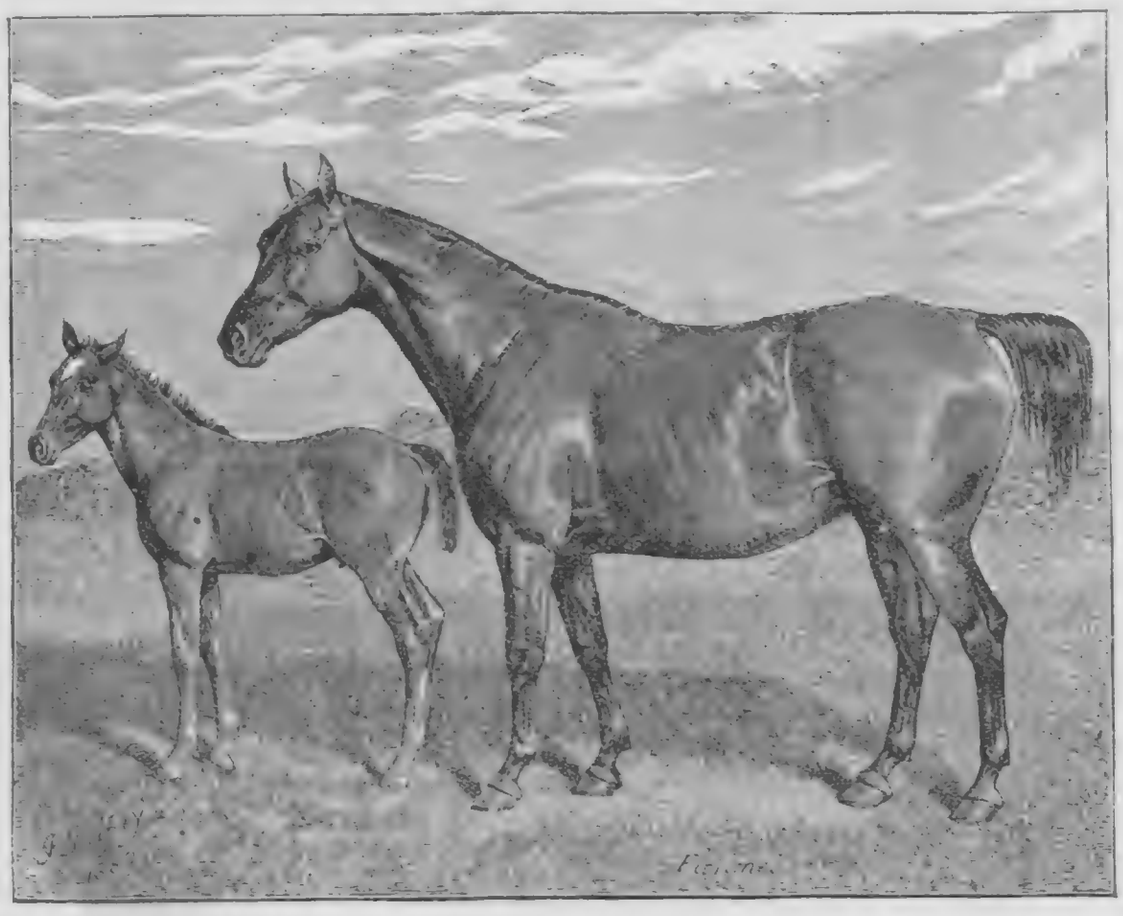
AS WOOL comes first, I generally hold till towards the latter part of the market, as, nine times out of 10, the wind-up of the wool market is the best. Very few around here hold their wool over, as the practice has not been considered very profitable all things considered. Butter we pack through the summer. We set our milk in deep cans and churn our cream sweet and make sweet butter and keep it sweet till fall. When the price suits we sell. When I was in debt I sold my wheat as soon after thrashing as possible, as it immediately saved paying interest. I generally watch the European markets and also the state of the crops in those countries, as wet weather on the European continent lessens the hard-wheat supply there, and half of the wheat grown there cannot be ground without an equal bulk of hard wheat, so if they have not got it there, they must get it where it does grow, which means from us. I do not want to delude any one, but I am looking for a healthy rise in wheat soon. In regard to the pork product, the Chicago Pork-Packers' Monthly Price Bulletins are a good guide. For instance, this year the prices on all salt and smoked meats are quoted considerably lower than last year, showing that the supply is greater than the demand. Last year the prices for these goods kept advancing; those who sold early this year, I think, hit it. About beef cattle: I have been in the meat business some time myself and I would say, when you get your beef "critter" fat, sell him if you can get a fair price. Be specially careful to get your beef ready in the spring and sell it. Don't "summer" it; if you do, you will get only a small return for the trouble.

One thing I have always endeavored to do—when any one product is bringing a good price I sell; when it is cheap there is no danger in holding; on the contrary, doing so is often a benefit. C. F.

Bancroft.

I MAKE it a point to sell wheat in the fall as soon as thrashed. Potatoes are sold as soon as dug when people are buying their winter supplies, unless the prospects are good for a considerable advance in price (say at least 20 per cent.) which I determine by statistics from the Agricultural Department and agricultural papers of different States. Apples I sell in the winter after the inferior fall fruit has been disposed of—from the first of December to middle of February. E. H. P.

Warren County.



HUNTER BROOD-MARE, FLORIMEL.

RE-ENGRAVED FROM THE LONDON LIVE-STOCK JOURNAL. FIG. 262.

I TAKE three agricultural papers, two county, one State and the World. In these I get home and foreign markets. My principal crop is wheat and from close observation of the markets at home and abroad, I have come to the conclusion that prices have about touched bottom, so I have decided to hold on to my crop and run the risk of getting less for it, for the chance of an advance in price. Last year I sold 100 bushels at 76 cents in September and four months later I sold 800 bushels for $1 per bushel.

The RURAL encouraged me to hold to a certain extent. Last Saturday I sold 50 bushels at 70 cent per bushel; 800 bushels more I am holding in hopes of an advance. A short time ago I saw in the R. N.-Y. that apples were scarce and bringing a good price East, so I didn't sell. Lots of my neighbors sold theirs for $1. per barrel; but I held on and have just sold mine for $1.50 per barrel. I rather think it paid to take the R. N.-Y. Also I saw in the same paper that potatoes were short in a good many places and rotting badly, and that they are worth $1.50 a barrel so that I have concluded not to take 25 to 30 cents per bushel at present. Perhaps I may lose; but the future will tell. R. F. B.

Benton.

BY reading the agricultural papers—I take five weeklies—and also the reports of the Department of Agriculture, I obtain some idea of what prices will be; but I find that to sell in the fall is the best, as the extra prices received in the spring will not cover the shrinkage in bulk or loss of weight of the majority of farm products. M. N.

Menominee.

NEW HAMPSHIRE.

I RAISE no crops excepting winter apples, small fruits, poultry and eggs. For many years I have shipped all of my apples to Liverpool and London, assorting and packing them in the orchard as soon as picked, and shipping at once. I always get good prices. My small fruits, of course, I have to sell as soon as picked. I keep 2,000 hens. I raised 4,000 Plymouth Rock chickens this year. I dress off the cockerels, usually in January, February and March, and never keep hens more than one year as they are not so profitable after that time.

Hancock. C. E. L. H.

I USUALLY sell crops, like potatoes and apples, soon after harvesting them, and I think that for a term of years it averages as well as to store them and bear the loss from decay and shrinkage; besides, I have the use of money sooner. As regards live stock and wool, I consult reports of the Boston and Brighton markets. M. A. N.

Sullivan.

NEW JERSEY.

THE chief crops I grow for sale are sweet potatoes, tomatoes, watermelons, wheat, and early white potatoes, ranking in importance in the order named. The major part of my sweet potato crop I store in a specially constructed house till winter. I am then governed in selling by the size of the year's crop and the quantity of it housed in this locality as nearly as I can learn. If I consider the amount housed is sufficient to meet the demands of the market with little increase in price, I sell the larger part at Christmas and New Year's, as there is usually a larger demand for them at that time, and I escape the larger loss of shrinkage and decay incident to a longer holding. If I consider the amount stored to be inadequate to the demands of the market, I hold till nearer spring. The tomatoes are grown for a local canning house at a stated rate per ton. The watermelons of course must be shipped as they ripen, the grower being allowed no "say" in the time of their sale. What wheat I grow—a moderate amount only—is sold about December 1, unless by the market reports of the daily and weekly papers I consider a rise in price imminent in the near future. My early white potatoes are sold as soon as they are fit to dig.

In the matter of the correct time for the sale of our farm crops it is certain we all cannot hit on just the best time, and if farmers would not get wild, as they seem to do at times, and rush large quantities of produce on an already falling market, to the detriment of themselves and the benefit of the buyers, they might come nearer to dictating the prices their labor should bring, and may we all hail the day when by organization or otherwise, farmers may know when to sell so there shall be no gluts, and all crops shall be sold at the best time. E. G. B.

Penn's Grove.

OUR money crops are chiefly citron melons, sweet corn, berries, asparagus, grapes, tomatoes, cucumbers, etc. The above we cannot hold, so we are compelled to ship them whenever they are fit, regardless of market prices; otherwise they go to waste, and this is sometimes the case, as the market prices now and then get below the cost of shipment. Sweet potatoes are grown quite extensively, but they are not held, as a rule, later than it is safe to leave them in the ground without injury from freezing. White potatoes are grown more abundantly back a few miles in heavy soil, and when the bugs first made their appearance it was said that this county (Monmouth) was growing more potatoes than all the rest of the State. To learn the market, we consult our commission salesmen, and also refer to the market reports in our papers for a general idea of the condition of crops and prices in all parts of the country.

Point Monmouth. J. S. C.

WE labor under different circumstances from those that influence the Western

farmer, and are not troubled so much about holding or selling our crops. I farm about 60 acres: about 20 are in berries. They are sold as soon as they can be picked, mostly in the New York market. Our next main crop is sweet potatoes. Some sell in the fall and they pay well then; others, like myself, have their cellars fitted for storing, and keep potatoes till winter or spring. We have found that it pays best to store and to sell about the holidays and from then till spring. Our commission houses as well as our agent at the station keep us posted as to prices. Corn, round potatoes, all kinds of garden truck, eggs, butter, pork, etc., not consumed at home, are sold in our local market. In winter I run a chicken ranch and raise about 2,000 broilers, which are sold in New York in early spring. I am posted as to prices by my agents and the houses in New York. A. P. A.

Vineland.

NEW YORK.

I GROW mostly perishable crops for home consumption and sell them as soon as I can for what they will bring. T. E. B.

Schuylerville, N. Y.

I SELL my crops generally in the fall. I rely mostly on the government reports for keeping myself posted on the amount of the different farm products raised, and hold or sell accordingly, and even then I am sometimes deceived. According to observation, the farmer that makes a general practice of selling his crops in the fall, realizes the most money. But few farmers are aware of the large per cent. that is lost by shrinkage by holding too long. C. P. B.

Stafford.

AS TO marketing our crops, I am in a dairy country and our money "crops" come from the cows in the shape of butter and cheese. The milk is carried to the factory and there made up into butter or cheese. We pay a man to sell these. We have a sales day when salesmen and buyers get together. The salesman is a patron of the factory. We try to raise enough on the farm to keep the cows; little beyond dairy products is sold from the farm. J. H.

Sinclairville.

IN regard to marketing my chief crops, I would say that my decisions are somewhat varied. Sometimes they are based on actual information and oftentimes on theory. I have recourse to the last-named means only when I am unable to procure definite information. My chief crops are evaporated raspberries, potatoes, lambs, wool, sheep, wheat and oats. The latter are secondary with me. In the first place, I take every possible means of keeping myself posted from the commencement of the season, taking four papers, one daily—a Rochester morning one—three weekly, the R. N.-Y. included. This gives me a large range in regard to the markets, both local and distant. I watch closely the government reports on growing crops. I also get price currents from commission firms once a week, from New York, Philadelphia and Boston, and ship my products to these cities if local buyers are not paying what markets at headquarters warrant me to ask, less freight and other expenses. I live in one of the best fruit sections of Western New York, where nine-tenths of the apples and black raspberries are evaporated, and my principal crop being dried berries, I handle them to get all I can out of that crop. I barrel them as soon as they are properly dried, in new sweet barrels, and if the crop is generally light and other evaporated fruits correspondingly so, I hold until the first of February of the ensuing year, (no later) and then sell. If before that time they reach a figure near what I think is a good offer I sell to the home buyers or ship to some distant dealer. I never am anxious to sell any crop that I produce when I see local shippers riding around the country buying up any particular commodity. But when I miss their presence at certain seasons, I begin to look for them and sell what I have of crops that have been above the average in production for the year. In selling potatoes I prefer to dispose of them in midwinter as I can do it cheaper when the teams are not so busy. There is a time—generally in February—when potatoes are the highest on the average, for the year; that is when the stock bought in the fall before navigation and cheap freight rates are over, runs out, and before the spring trade and shipments arrive at headquarters. Last winter was somewhat an exception to this rule owing to its being such an open season. I deviate from this rule when the crop is large and very cheap in the fall, as was the case last year. Then I get all I possibly can to market. Wool I sell at or near shearing time, as I find it brings me more at that time than at any other, as the manufacturers send their men regularly every season to buy and take it in and they are able to pay more for such grades as they want than they could if they bought from some heavy Eastern dealer who had paid freight and commission from the West. I sell my lambs at the local butcher's or to runners from Rochester, keeping myself posted on the Buffalo market, and making my price accordingly, turning off my store sheep when there is a scarcity and prices are high, as at present. Wheat and oats, I sell when there is the best demand from millers and feeders, which is generally during the winter months, or in the case of a wheat boom or corner I drop mine into market if I can when the "corner" iron is at a white heat! Sometimes these rules of mine do not work to my benefit. When I get too much theory mixed in with my ideas in regard to the probable price of a certain crop, I often lose as much as I make on some others about which I have more certain knowledge. F. W. S.

W. Walworth.

MY chief cash crops are potatoes, pork and butter. I sell as soon as my crops are ready for market. I think that, taking one year with another, that is the best time to sell. I have sometimes held my produce for higher prices when I thought, from reading the crop reports in the RURAL and other papers, that the state of the crops in general warranted it, but have not always been successful in getting a higher price. I usually manage to have early spring pigs, and sell them about the middle of September, at the opening of the fall trade. And then I have early fall pigs, which I sell about March 1. I manage to have my cows fresh in September or October, because winter dairying pays better than summer dairying. I have a fine crop of Monroe Seedling Potatoes this fall, and am putting them in the cellar. My reason for this is that there is a demand for that kind for seed next spring, at a higher price than potatoes are bringing now. If my crop were any of the common varieties, I would sell as soon as they were dug. From reports of the potato crop I see nothing to indicate a higher price. P. C. B.

Middle Falls.

I AM a milkman and am selling about 225 quarts per day. I produce most of it myself and sell it at five cents per quart in summer and six in winter. I think a great deal of the RURAL. O. W. G.

Olean.

OHIO.

To keep posted on the market I watch the prices in the nearest large market as given by the papers, also the State reports and various other reports as to the probable yield at home and abroad, and make comparisons with the condition of things the previous year. But, of course, these things can not be depended upon as a certainty, for a corner is likely to occur without much regard to the relation of supply and demand. Some farmers around here held their wheat last year and the good prices came: they were offered $1.10 per bushel, but held for a little more, and are now selling it for 75 cents. Unless there appears to be quite a considerable deficiency in the supply, I sell my grain as soon as it is thrashed and avoid all risk, shrinkage, waste, etc. Corn and oats I seldom have to sell. If I had them I would prefer to feed them to sheep and hogs, and sell the hogs in early fall or spring, and the sheep in March or June. Wool I sell when about two-thirds of the wool in this vicinity is bought; the price usually starts low and competition brings it up until the bulk of it is bought, and then very often it drops. Potatoes I would haul to market right from the field, if I could get 25 cents per bushel for them, unless I had more than the average facilities for storing them. C. E. F.

Brighton.

PENNSYLVANIA.

Corn, wheat, oats, potatoes and tobacco are our chief crops. Corn is sold from February 1, to September 1. Some is sold from the field; but not a great deal. Wheat is sold about from the time when it is in a condition to be thrashed until spring unless there is a rise in the markets, when sales are the highest. Oats sell highest about June, and tobacco from March 1, to May 1. Potatoes are sold from October 1, until the weather is too cold for shipping. To learn the prices I inquire of the local dealers and observe the market reports of the city papers. I do not hold my products, but sell them when I have time to thrash and deliver, unless the markets are up, when I try to meet them, for future prospects are very uncertain. J. S. C.

Shiremanstown.

POTATOES are my chief crop. Sometimes I sell in the fall and at other times in the spring—about planting time. I try to keep myself posted on the state of the market through local dealers and the market reports in the R. N.-Y. I decide when to sell by the prices offered, and the crop reports in the R. N.-Y. L. W. McE.

Wilawana.

OUR chief marketable products are hay and dairy goods. Hay is pressed and sent to New York and the coal mines. Butter is generally sent fresh, though some is packed and held for better prices, which are nearly always obtained in December and later. Potatoes are a failure—half a crop at most. Buckwheat is good; oats fair. I stock my farm with sheep and colts.

Wellsboro. D. A. S.

THIS is a dairy section. Wheat is the only grain sold, and I generally sell from the machine. I usually thrash it in August. I value the RURAL for its information as to crops, and think it is the best source of information I know of as to the abundance or scarcity of crops. J. P.

Wawa.

RHODE ISLAND.

Our chief crops which we turn direct into money are potatoes and garden truck. In case of the latter, we endeavor to grow such as will find a ready market at the hotels here during July and August. Potatoes we sometimes sell at the same time; but often we hold them till February, when, as a general thing, they bring a trifle more in the Providence market, because, I suppose, the winter supply is then reduced and the weather too cold for extensive shipments. I determine whether to sell or hold them in August, by the price paid at our local market, by the reports in my papers on the general crops throughout our country and by the R. N.-Y. "Special Reports." Hay I never sell, but turn it into money first through my cows. (I sell milk during July and August and butter the remainder of the year), and, second, through my sheep for early lambs and wool. Stock-raising does not pay here now except that we need domestic animals to keep up a proper balance on the farm. Grain I cannot grow for the figures at which I can buy it, but I grow considerable in the rotation of crops and turn it into money with more or less profit, first, through my hens (for eggs), turkeys and geese, for the Thanksgiving and Christmas markets, and, second, through my hogs for spring and fall pigs for the local demand. E. P. C.

Block Island.

VERMONT.

THE large majority of the inhabitants in town are engaged in "raising" marble and preparing it for market. It is mostly sold by drummers, though the marble dealers throughout the country have a date for coming together here and having a good time, and selecting such as they desire. So far as the crops from farmers and market-gardeners are concerned, I think there is no special time for marketing them, as we are within three or four miles of the largest village in the State (and some say in New England), where the products can be sold at any time when ready, so that there is no need of studying markets abroad. There is a cheese-factory in town and I am told that the products are sent to the Boston market about once a month. One or two farmers raise very fine Merino sheep which they are in the habit of selling in the West and Southwest whenever they can get their price. J. D.

W. Rutland.

Everywhere.

RURAL SPECIAL REPORTS.

Illinois.

YELLOW CREEK, Stephenson County, October 3.—It appears as if we should have a better clover seed crop than in previous years. Corn is an average crop. Wheat is poor. Rye is an average, oats from 40 to 60 bushels. Potatoes are above an average crop. P. A.

Indiana.

ELKHART, Elkhart County, October 7.—Clover seed is worth, $3.75 to $4 per bushel, and there is probably 50 per cent. of a full crop in this county. Of wheat some report 30 bushels per acre, and there is probably 80 per cent. of a full crop. Of corn some report 97 per cent. of a full crop, but it will not average over 80 per cent. Oats are the best crop in the last five years, and will average 40 bushels per acre. Potatoes a fair crop. Rye an average of 20 bushels per acre. There was a large crop of hay and it is worth from $6 to $8 per ton. Apples one-quarter of a crop, and of a poor quality. Of the growing wheat crop reports say there is no fly, but the weather is too dry, so it comes on slowly. P. H. O.

Michigan.

MASON, Ingham County, October 5.—In Mason and the vicinity clover seed is a full crop. Wheat is generally sown. The weather has been cold and dry since about the middle of September. Unless we have rain soon wheat will be small for winter. Potatoes are a good crop and of excellent quality. Apples about two-thirds of a crop. T. W. N.

BRIGHTON, Livingston County, October 6.—Clover seed has averaged about two bushels per acre: this is more than the average yield. Other crops haven't done as well as usual on account of drought.

I. H. P.

MONROE, Monroe County, October 11.—What clover has been thrashed turns out poor—not half a crop. One thrasher said that he thrashed all day on 20 acres and got only eight bushels; another said that he had not made more than enough to pay expenses so far. Wheat in yield is as good as last year; but the quality is not so good, it has shrunk more or less. Early-sown oats are better than last year; late-sown were struck with rust and were light. Corn will not average over two thirds as much as last year. Hay will average as good as last year. Hay and grain were secured without any rain to hurt them, and the weather is dry yet. Early potatoes are good; late ones are not as good as they would have been if it had not been so dry. Pears and apples the best we have had for a long time. Grapes are good. W. D.

QUINCY, Branch County, October 7.—As regards clover seed in this section, the crop is extra, probably 25 or 30 per cent. better than for a number of years. The potato crop is good—no rot. Wheat poor—injured by aphis. Apple crop fair. Oat crop *very* good. C. H.

New York.

AVOCA, Steuben County, October 1.—Some time since I reported potatoes 60 per cent. of an average crop. I find, as they are being dug, that the estimate was far too high, it looks now as though there would be one-half an average crop. Grain is not yielding very well. C. H. E.

Ohio.

EDGERTON, Rock County, October 5.—Three different men who make a business of hulling clover seed and who thrash over a large scope of country report a scant half crop of both large and small clover seed. Corn, oats, potatoes and hay are good crops; wheat good on the sand, poor on clay and heavy soil. H. S.

MEDINA, Medina County, October 5.—According to present indications the clover seed crop will be a full average at least. Of wheat we are thrashing a very heavy crop. Corn very poor and potatoes nearly a failure. There is a large crop of hay; but it is uniformly of poor quality, as haying weather was very bad. W. P. W

DEFIANCE COUNTY.—Clover seed in my neighborhood has not turned out well: one to three bushels per acre. I hear, however, that on the gravel ridges there have been yields as high as six bushels; that is, of the "big" kind. Price low: $3.50: to the "huller," 75 cents. Wheat is not up yet; the weather is too dry and on that account less was put in than was intended. Only here and there have we a fair yield of corn. Wheat, oats and hay are average crops.

I. I. J.

Vermont.

WILLIAMSTOWN, Orange County, October 12.—Early-planted potatoes are yielding fairly well; while later-planted are not half a crop. Early in the season potatoes began to rot, but a week or 10 days of dry weather saved them from further decay. Through our township there will not be much more than half a crop; mine yielded at the rate of 175 bushels of marketable tubers to the acre; they are selling for 50 cents per bushel here. H. L. P.

THE FARMER'S CLUB

ANSWERS TO CORRESPONDENTS.

[Every query must be accompanied by the name and address of the writer to insure attention. Before asking a question, please see if it is not answered in our advertising columns. Ask only a few questions at one time. Put questions on a separate piece of paper.]

AN AILING COLT.

F. H. Arenzville, Ill.—A yearling colt was castrated last spring and did well. He was put in a strange pasture with other horses. After some time he was found down and when he got up he would sway backwards and forwards and then fall down. About four weeks later when I saw the colt, when standing up he was liable to fall at any moment. His jaws were not locked, but there was every other appearance that he was suffering from tetanus. He was and is still very easily frightened; the cords of his neck were so tightly drawn that he couldn't get his head to the ground, and he was weak in his back. I gave a stimulating liniment to be rubbed on the back, neck, and loins and prescribed for him inwardly, and he seemed to improve, but not sufficiently. In traveling 2¾ miles to my place he fell a number of times. I have had him for 10 weeks. He eats heartily, looks well and can get his head down to the ground. His fore parts are apparently all right, but he is still weak and his hind parts are ailing, and the muscles near the roots of his tail are wasting away. What is the trouble?

ANS.—The condition of the colt may be the result of an injury, a kind of blood poisoning, or possibly a mild form of tetanus. If the wound from castration healed readily and there has been no trouble from it since, it is probably not tetanus, at least not from the castration. Having no clue to the cause of the condition, we cannot suggest treatment, or give any opinion as to the chances of recovery. It is probably a peculiar case, that would require a personal examination to form a correct diagnosis.

MARE NOT BREEDING.

J. E., Keokuk, Ia.—My 16-year-old mare is in good health, has a good appetite and is able to do all the work required of her; she has been a regular breeder until the last two years. She has been bred each of these seasons, but she has failed to bring a colt since 1887. This season she has been bred to a five-year-old stallion—a sure getter—six times. The last time she received a double service, and then refused for two months. About that time she began to spill blood and continued to do so for five weeks and then acted as if she was in heat. The party who owns the stallion refused to let him serve her, thinking she had some disease. She then stopped bleeding and showed no more signs of being in heat. She eats well, is in excellent health and gaining in flesh, but now after three months she begins to bleed again. 1. Is it possible that she is with foal? 2. If not and she should come in heat, would it be safe to let a horse serve her? 3. Is the spilling of blood caused by disease, and should she be treated? If so, what treatment should she have to effect a cure?

ANSWERED BY DR. F. L. KILBORNE.

1. The mare is probably not with foal.

2. Until the cause of the hemorrhage—bleeding—is ascertained we would not consider it advisable to have the mare served. The chances are against her breeding again.

3. The bleeding may be due either to disease or injury. A personal examination would be necessary to ascertain the nature of the trouble before we could advise treatment.

THE SCOTCH PINE AS AN ORCHARD WIND-BREAK.

W. B. G., Farmington, Michigan.—Would Scotch Pine make a good wind-break around my orchard on heavy clay soil? What other variety would be more suitable? At what distances apart should the trees be set?

ANSWERED BY ROBERT DOUGLAS, WAUKEGAN, ILL.

Within 200 feet of where I am writing stands a Scotch Pine wind-break, planted 19 years ago on heavy clay soil, with trees 12 to 18 inches high, which were once transplanted, placed 20 inches apart in a single row. It was cultivated the first year, but has not been cultivated since that time. It has never been pruned. The trees are all living and nearly of uniform hight. A single row planted closely, makes a much better wind-break than a double row. While the Scotch Pine should not be planted as a permanent forest tree, its extreme hardiness makes it second to none for a wind-break.

LAMENESS IN PIGS.

Mrs. M. R., Presque Isle, Ohio.—My three-months-old pigs are in good growing order; but three weeks ago they became lame in the hind legs, and their joints are slightly swollen. They have a dry pen and a small, dry yard to run in, and are fed a very little corn with a slop of boiled potatoes, milk and shorts. What ails them?

ANS.—The lameness may be due to rheumatism or to constitutional weakness. See that the pigs have warm, comfortable quarters with plenty of dry bedding. Do not overfeed. Add flax-seed-meal to the ration in proportion of one part of meal to six or eight of the swill feed. Try the following powders giving one dessert-spoonful night and morning in the feed to each pig: Sulphate of magnesia, bicarbonate of soda and nitrate of potash, each one-half pound—mix.

SEEDING WITH GRASS.

H. P. L., Bergen County, N. J.—On page 640 Charles Chapman says he sows grass seed with rye in the fall, but if wheat is sown the grass seed is used in the spring. Why is this?

ANSWERED BY CHARLES CHAPMAN.

I would not sow Timothy with wheat in the fall because I believe that several fields of wheat have been seriously injured in former years by the rank, thick growth of Timothy. I have never noticed any injury to the rye crop from a heavy growth of Timothy, and as this protects the clover roots during the first winter, I shall continue to sow Timothy with rye in the fall.

Miscellaneous.

E. M. Mc M., Southville.—The Empire Drill is made by the Empire Drill Company, Shortsville, N. Y. It is a good one.

F. W. H., Warren, Maine.—Would the Berckmans Grape be likely to bear and ripen its fruit here, if laid down and covered with earth during the winter?

ANS.—We think so.

M. I. Mc M., Smithville Flats, N. Y.—What is the name of the tree from which the inclosed branch was taken?

ANS.—The Common Cork Elm (Ulmus racemosa). It grows wild on "river-banks, west of New England to Wisconsin and southward," says Prof. Asa Gray.

P. H. A., Fort Smith, Ark.—Which of the two inclosed specimens of grass is Johnson Grass—No. 1 or No. 2 What is the name of No. 3?

ANS.—No. 1 is Johnson's Grass; No. 2 Panicum virgatum—Tall Smooth Panic Grass—No. 3 Erianthus ravennæ—Ravenna Grass or Giant Wooly Beard Grass.

T. B., Townville, Pa.—How should a monthly rose be treated?

ANS.—If in a pot, see that the drainage is perfect. Keep the soil mellow on top and mingle with it a pinch or so each of unleached wood ashes and nitrogen in some form. Fine bone would be good. If in the open soil, mulch it with old manure.

W. B. C., Shippensburg, Pa.—I have a fine heifer that eats well, and seems well when lying down; but when up she breathes heavily, like a horse with the distemper. There is no discharge from the nostrils, though there are indications that the seat of the disease is there. She has been thus affected only for a few days. What is the cause and a cure, and is the disease contagious?

ANS.—A personal examination would be necessary to locate the cause of the heavy breathing. It is probably some local trouble and not a contagious disease.

R. D. M., (no address).—1. What is the best way to protect through the winter young grape-vines that were set last spring and which have made a fair growth through the summer? 2. Does a thrifty Shaffer's Raspberry need winter protection? 3. Where can seed of Livingston's Golden Queen Tomato be got?

ANS.—1. Lay the canes down and hold them by a stone on the top of each. Then cover with evergreen boughs or any loose material. 2. The Shaffer is hardy in the climate of New York. 3. It is a mistake to call the Golden Queen Tomato Livingston's. W. Atlee Burpee of Philadelphia, Pa., catalogued it years ago. It is the best of the yellow tomatoes.

Discussion.

FARROW *vs.* FRESH COWS.

PROF. C. S. PLUMB, KNOXVILLE, TENN.—The articles in the RURAL of September 28, on the relative merits of farrow *vs.* fresh cows, interested me very much. Fortunately I had, near by in my desk, over 200 milk records of cows, covering periods of from 150 to 720 consecutive days. These records all relate to one herd, which consisted of Jerseys, Ayrshires and natives, with the Ayrshires strongly predominating. Of the 210 records, 34 pass over 12 or more 30-day periods.

In January 1887, in an article in the National Live Stock Journal, I discussed this same subject and from that article I quote the following first table as the most direct evidence I have upon the matter. It is compiled from the records in my possession, and may be accepted as reasonably accurate. The periods are 30 days each, and A, B, C, D, E, are records of native cows, and I, II, III, IV, V, of Ayrshires.

TABLE I.

PERIOD.	A.	.	C.	D.	E.	I.	II.	III.	IV.	V.
1	681	812	809	859	816	800	998	923	783	691
2	688	843	885	920	739	877	1039	953	794	753
3	767	885	862	453	705	901	1002	940	631	801
4	726	830	781	318	621	694	740	666	572	573
5	650	784	776	312	581	665	654	552	496	605
6	631	746	608	349	604	612	642	631	564	624
7	662	729	565	321	533	593	654	624	512	470
8	530	577	516	392	520	491	654	565	463	429
9	522	545	500	358	453	420	599	480	456	411
10	466	471	446	361	462	359	544	392	462	401
11	389	460	418	331	459	389	477	298	466	396
12	378	504	386	307	386	573	474	225	520	346
13	415	440	411	339	361	506	422	494	579	374
14	446	402	398	314	372	561	400	504	528	403
15	409	333	370	321	359	545	356	540	445	423
16	436	345	343	196	311	456	291	460	355	380
17	382	365	278	226	320	421	271	412	344	369
18	554	316	262	248	335	425	243	430	249	264
19	589	...	362	118	343	389	...	392	233	...
20	547	...	399	...	...	324	...	356	130	...
21	531	...	365	...	...	165	...	321	122	...
22	555	...	351	...	...	...	...	321	140	...
23	559	...	279	...	...	...	...	290	...	...
24	...	...	228	...	...	...	...	248	...	...
Total pounds	12,513	10,387	11,598	7,043	9,280	11,166	10,460	12,017	9,844	8,713
Average lbs. per period ..	544	577	483	371	488	532	581	500	447	484

All of the above figures refer to pounds. The first five rows, designated alphabetically, relate to natives, while the last five relate to Ayrshires.

The smallest average yield given was 371 pounds, the highest 581 pounds. Only two cows fell below 450 pounds. The natives gave an average yield per period, of 492.6 pounds, and the Ayrshires 508.8 pounds, or an average yield of 500 pounds for each of the 10 cows, for 18 months or more. Estimating this milk to have at least a value of two cents per quart on the farm, the milk for one period would be worth $5, or for a year $60. Adding to this income the value of manure, we get a considerable additional sum. There certainly was a profit here.

As nearly as I can estimate, from 179 yearly records, discounting all under five and over 15 months, a cow producing milk, not with calf, practically becomes farrow after 9.3 months. Comparing the first nine periods of the animals above mentioned as not farrow, and the last 15 periods as farrow, we find the smallest average quantity given by any one farrow for 30 days, is 276 pounds; the largest 475 pounds. The natives' average is 376 and the Ayrshires' 383 pounds, with 379 pounds for the 10 animals.

After selecting the yields of five other natives, and five Ayrshires, not noted in the table given for the first nine months of milking, and comparing them with the average period yields of each animal given in the above table, we get the following:

	—NATIVES.—					—AYRSHIRES.—				
Average of table,	544	577	483	371	488	532	581	500	447	484
Av. of other set,	700	607	454	488	560	614	444	563	693	493

In the first table, it will be noted that the average amount of milk produced per period for the 10 cows during periods 15-24 was 379 pounds, while in the second period we get an average of 561 pounds for the 10, or a gain of nearly 100 quarts in favor of those not farrow.

All of the above cows were better than average milkers, hence if a milkman had kept the best of them, and fed them high, he would have found them very profitable animals. But, under ordinary circumstances, it seems to me that the figures strongly favor breeding the cow each year. A rest of a month or six weeks will suffice for the animal prior to calving. On the college farm here, I breed the cows yearly, endeavoring to arrange so as to produce the least amount of milk in one herd during July, August and September, when there is not the demand or price in this region for milk or butter that we get the rest of the year.

As I write this, I have before me a copy of an agricultural paper containing a picture of Landseer's Fancy, with a brief statement concerning her record, which has not yet been beaten by a Jersey—936 pounds, 14¾ ounces of butter in a year. As bearing directly upon this question of farrow vs. fresh cows, I note that Landseer's Fancy has but just dropped her 14th calf. And yet she must be a very profitable cow entirely outside of her value as a breeder of thoroughbred stock.

THE NEW JERSEY MILK LAW.

FRANKLIN DYE, SECRETARY N. J. STATE BOARD OF AGRICULTURE.—A farmer in New Jersey rests in jail rather than pay a fine imposed upon him for selling milk which fell below the legal standard. The farmer claims that the milk came directly from his cow and that nothing had been added to it. If this be true, which is the culprit—the man or the cow? The New Jersey law requires that milk shall contain at least 12 per cent. of solids. This looks reasonable enough; it would seem that a cow giving milk less than 12 per cent. of solids is not worth keeping, yet there should be no foolishness or carelessness about the official examination of the milk. The proportion of solids in milk from a given cow will vary considerably. A cow at the Wisconsin Station gave but 11⅛ per cent. of solids in the first pint of milk drawn from her; while the last pint contained 19⅛ per cent. Fright, change of feeding, a chill and other conditions may affect the cow so that a sample of her milk would give an entirely untruthful record of her usual performance; so that we see that carelessness in the enforcement of a milk law may do injustice.

In the above—taken from the RURAL of October 5, page 664—there are a few questions to be answered which will require a few "ifs."

The first "milk bill," or starting point of our present milk laws, was passed in 1875, and grew out of the practice followed by the creameries in the northern part of our State, to enter the market and sell their "skimmed milk" in competition with "whole milk," and though at a lower price, the retailer could and, it is claimed, did add, or mix a small quantity of "whole milk" with it, and sell it as "pure milk." This was, of course, an injury to those engaged in milk dairying, and to consumers of milk—to the former because he did not obtain the price he should for the product of his cows, and to the latter because he did not receive "whole milk." On account of this, an agitation of the question was begun and carried to the legislature and resulted in the enactment of the law referred to. That law was subsequently changed and amended in many particulars, and the law now governing the milk question was passed in 1882. It requires a man to sel pure or unadulterated milk, and the ad dition of water, however pure it may be, claimed to be, under the law, an adulteration. A person cannot be imprisoned under this law except for refusing to pay the fine

imposed for an offence proved (by chemical analysis—not by a "lactometer,") or by continuing to sell adulterated milk. Now, keeping in mind what the law in this particular is endeavoring to secure, according to its requirements, "whole" or "pure milk" is milk *just as it comes from the cow.* According to the *spirit* of our law, the milk test made at the Wisconsin Station shows that that milk was pure; but according to the letter of the law, a man selling such milk would be adjudged guilty of adulteration. The test at the Wisconsin Station is not by any means an isolated case, and there are gentlemen of reliability who claim that there are cows that will not by any course of feeding produce milk containing 12 per cent. of milk solids. Mr. Browning, of Camden, says he knows it to be a fact that the quality of milk varies with the different seasons, and admits that sometimes the milk from his herd falls below the standard fixed by law. On the other hand, Dr. Shippen Wallace, of the State Board of Health, says he "is thoroughly convinced that there is no herd of good, healthy cows (and if the cows are not healthy the law forbids the sale of their milk) in the entire State whose milk on analysis will show less than 12 per cent."

From the experiment at the Wisconsin Station, and other similar testimony, and taking Dr. Wallace's statement into consideration, it is clear that milk from most herds should be thoroughly well mixed together before canning and carting to market, and that no analysis of the milk from one or two cows only should be made to prove the standard of a herd, or the character of the owner.

In the case instanced above, if the man did not water the milk—and he claims he did not—he does well to become a martyr rather than pay an unjustly imposed penalty. Moreover, if this was his (?) first offense, and his cows' milk fell below the legal standard for want of strong feed—grass, owing to so much rain has been very flabby this summer—if his character for honest dealing in his business life is established, he ought to have been released, free of cost, with an admonition to strengthen the feed. Otherwise every farmer must needs be a chemist or else send his milk often for examination. And this suggests whether it would not be better to inspect the milk in order to have it *produced* pure and up to the required standard rather than to seize a sample now and then in a hap-hazard way in order to find milk that falls below the legal standard. This would require an occasional inspection of the dairy stables of milk-producers, as to their construction, ventilation, etc., their daily cleanliness, the condition of the pails, cans and milkers at milking time, the courses and varieties of feed, the character of water and the usual condition of barn-yard or stable surroundings. Certain requirements of this kind, made of otherwise honest men, would, it seems to me, secure better milk from all herds and all the time, than can be obtained by the present method. Also, let samples of milk be taken from the stock of producers and retailers of milk in all parts of the State quite frequently, and let the results of the analyses be published somewhat as the analyses of fertilizers are now published. This would have a tendency to drive poor milk from the market.

Chemists admit, I believe, that they cannot determine whether the water in the milk is there through Nature's work or owing to adulteration. If they could determine as to the latter point, the law would be just. Failing in this, it is assumed that pure milk should show 12 per cent. of solids. Now, much milk is produced in the State that will yield more than 12 per cent. of solids. If the standard of purity fixed by law is a certain per cent. of solids, are not the producers of such milk—as some of them claim—justifiable in watering their milk down to the legal standard? The chemists cannot tell the difference, and yet if the milk-owner should be *detected* putting water in such milk, though it be *above* the standard, he could be arrested, and if proved guilty, must pay the penalty or go to prison! Our "milk law" is not perfect, but I will not find fault with it until I am able to suggest a better one. A man who sells water for milk ought to be punished; so ought the long list of adulterators of other goods. Milk ought to be sold on its merits, from original packages from the dairy and the creamery. The quality of the milk being fixed at these two starting points, the retailer must be held responsible for what he sells. This whole subject is a very important one. It may be necessary to continue the discussion in a future issue of the RURAL.

IS HAY, HAY?

PROF. F. E. LADD, GENEVA, N. Y.—The R. N.-Y.'s question, "Is a ton of Timothy hay of the same value for feeding, regardless of the soil upon which it is grown?" is one worthy of careful study. It is a common saying among feeders, that "hay spends well this winter, or hay spends poorly," which means that the feeding value of hay grown on the same farm varies more or less for different seasons. Thus the farmer has recognized a difference in the feeding value of different lots of hay. As yet there does not seem to be sufficient data to determine whether hay grown on different soils has a like feeding value. From observation and such experiments as have come under my observation, I believe that Timothy grown in clay soil will be found to have a different feeding value from that grown on sand or muck. The difference in soil, however, does not seem to be so influential as that in the climatic conditions. Some investigations at the New York Experiment Station at Geneva, as given in the sixth and seventh annual reports, seem to demonstrate that the feeding value of Timothy, and of the hay from other grasses as well, is quite variable, as judged from chemical analyses. It was found that the albuminoids or "muscle-formers" in Timothy from the same plots for two years were:

	PER CENT.
Timothy 1886	4.69
Timothy 1887	8.12

For Orchard Grass and Tall Meadow Oat Grass we find the albuminoids as follows:

	PER CENT.
Orchard Grass 1886	7.38
" " 1887	8.94
Tall Meadow Oat Grass 1886	6.75
" " " " 1887	10.37

In one ton of the above-named hays there would be of albuminoids.

	1886	1887
Timothy hay	79 lbs.	137 lbs.
Orchard Grass hay	124 "	151 "
Tall Meadow Oat Grass hay.	114 "	175 "

From the last table it seems very evident that the feeding value of the hay for the two years was very different and the common saying, "Hay spends poorly or hay spend well," is justified.

The examinations of hay from different localities made at the same station, show less variation in feeding value than for hays grown at the same place under different climatic conditions. From the analyses as given for Timothy hay, one ton, for 1887, would have of albuminoids:

HAY FROM	POUNDS IN ONE TON.
Maine	146
New Hampshire	135
New York	137
Wisconsin	123

In the clover we have considered the albuminoids only, and of course the carbohydrates would change somewhat the relative feeding value; but as a whole the albuminoids, (in hays cut at the same period of growth—full bloom—as in these experiments) may safely be considered a fair measure of the relative feeding values. The studies thus far made seem to indicate that the variation in the feeding value of hays from different localities and soils is not so great as upon the same soil under varying conditions of rain and sunshine. We may say that, often, all the climatic conditions are a more potent factor in determining the quality (and sometimes the quantity) of the hay crop than are fertilizers of recent application. As a general conclusion, it would seem that, one season with another, on the same farm the maximum hay crop will have a minimum feeding value, and the minimum hay crop a maximum feeding value.

FEEDING CORN.

P. H. JACOBS, HAMMONTON, N. J.—Corn is probably the cheapest poultry food, but something depends on the season of the year, and also the climate. Where the winters are very cold a larger ration of corn may be given. The value of carbonaceous food depends not entirely on its adaptability for egg-production, but also on the supply of warmth it affords. Many persons attribute the increase of eggs to corn, when, in fact, the corn has induced egg-production more by keeping the hens warm rather than through the supply of egg elements afforded, and as warmth in winter is essential to the production of eggs, corn, wheat or any carbonaceous food is valuable. Corn alone will not produce eggs. A hen that is fed exclusively on corn will be unable to supply the mineral elements of the eggs, and though she may, by eating largely of corn, find sufficient nitrogen for an egg, she will, in time, from the excess of carbon, become excessively fat.

I find the cheapest egg food in winter, and the most complete in the proportions of nitrogen, carbon, and mineral matter, is a mixture of clover (chopped into half-inch lengths and scalded), corn-meal and bran. This ration supplies bulky food (or an equivalent of green food), promotes digestion, and costs less than any other food. It affords a variety, and corn may be given also. Experiments show that as long as the hens are kept in exercise, corn may be fed liberally, but though one may attribute all the beneficial effects to corn, yet the amount of food of a various kind picked up by the hens in winter, is greater than may be supposed, especially if they have access to the barnyard, as they will pick up clover heads, leaves, the blades of corn-fodder, and other food required.

The best indicator is the hen herself. When she refuses corn and seeks something else, it denotes that she wants some element not fully provided by corn. In like manner she will reject other foods and eat corn. The best results are obtained from a varied diet, and though the hens may do well on corn, yet they may do better on variety. Milk in this section is too expensive. Wheat is used more than corn here, though corn is regarded as the cheaper grain. Meat is the best egg-producing food, but it is expensive. It should be fed in connection with grain, however. My advice is to feed corn, as the hens would get but little else in some sections, and it is almost indispensable to egg-production in winter, in cold climates. The RURAL's suggestion to use milk is excellent, but such a diet, exclusively (milk and corn), would compel the hens to drink to excess to secure the desired amount of solids, while the continued feeding of curds would affect the bowels. Hens should not be fed on a concentrated food any more than cows or horses. Clover, potatoes, milk, meat, with plenty of corn, are better than any single article. It is not an easy matter to make up a "perfect ration" for a hen. If she ceases to lay regularly, corn will soon cause her to become useless, but as long as she is producing eggs she will use a vast amount of "raw material" for that purpose. Milk, daily, added to other food, will largely assist in supplying many elements not obtainable so easily from other sources.

IMPROVEMENT IN POTATO DIGGERS, ETC.

P. M. B., RINGTOWN, PA.—F. A. B., Rising City, Nebraska, says that he is interested in potato-diggers. When people write for publication, or for any other moral purpose, and, more particularly, to give or ask for information about farming, about which there should be no secrets, why not give the full name and address, so that if any one wished to write to them he could do so? I have no digger to advertise, but would like to correspond with him about one. A few years ago, I made a small model of a digger, of the success of which I felt quite sanguine at the time. It has no shaker, but instead, a revolving cylinder. A working one should be two feet long and two or 2½ feet in diameter, with two-inch meshes. I had some doubts about the row going into it, but none whatever of its working. It would clean the potatoes, leaving them free from earth, excepting those that would go through a two-inch mesh. Now I think I can overcome the difficulty of getting the potatoes into it, and I think it can be made to work where the ground is pretty clear of weeds.

R. N.-Y.—There are several reasons, more apparent to editors than to the general public, for not publishing the names and addresses of correspondents. Many seek free advertising in this way, and it is unfair to our regular advertisers who pay for the space they occupy, to *give* space to others. Then many correspondents do not wish to be subjected to the annoyance of answering the numerous letters which thoughtless persons are likely to inflict upon them and which are many times entirely needless. Then again, there are numerous sharpers of all kinds ever on the outlook for the names and addresses of farmers; for, these once obtained, they are sure to tempt or bother the people with alluring circulars and specious schemes, and if the names and addresses are given in the paper the rascals are pretty certain to utilize them. The editor must be the judge of the extent to which these rules may be suspended. If our friend has a novel and valuable improvement in potato-diggers he should have little difficulty in inducing some implement manufacturer to take hold of it, as there is considerable chance for improvement in these valuable implements.

MORE ABOUT THAT MONTANA BOOM.

E. B., MERCHANTVILLE, N. J.—I write to thank the RURAL NEW-YORKER for pulling the scales from my eyes as to the Montana land boom now occupying so much space in many journals hitherto considered reliable and truthful. With me it has been an enigma why so much space was devoted to the laudation of this new sister State. I naturally supposed that the space was paid for by some land syndicate or railroad corporation. But it was not until the R. N.-Y. laid the matter open to its readers that I fully comprehended the cause of such extended puffing. I extend to it my personal thanks for its bold exposure of these designing editors, and feel that I hazard nothing in saying that it has proved a benefactor to more than one young farmer in its family of readers who were seriously contemplating going to try their fortunes in this far distant land. The editor of the Orange Judd Farmer has for years been an especial friend of mine and his misfortune with the American Agriculturist aroused my deep sympathy, so much so that I discarded the Agriculturist and subscribed for the Prairie Farmer under his management, Since his retirement from that journal I have been an object of his generosity by receiving the Orange Judd Farmer gratuitously. I had about made up my mind to subscribe for it regularly. I like to have a Western farm paper among the many I now take, and dislike to have a paper that is not worth paying for. The R. N.-Y.'s exposure has so thoroughly laid bare the position of the journal in question that I shall order it discontinued.

USE OF ROTTED POTATOES.

HENRY STEWART, MACON COUNTY, N. C.—Some weeks ago I stated in a communication to the RURAL that I was feeding rotten potatoes to pigs and cows as a test of their healthfulness, or otherwise. Two cows, milking, have had each a peck of the least damaged potatoes daily for more than three weeks, and four pigs have been turned into the potato field where they eat the diseased and rotten tubers that were rejected at the digging. Nothing in any way unusual has been observed in the cows or in their milk or butter, nor has anything unusual been observed by close examination of the milk and butter under a microscope of 500-diameter power. The pigs are doing excellently, fattening on their ration of milk, with the potatoes, and now of corn and have cleaned up every tuber without any repugnance and with the usual good appetite of thrifty young pigs. I have myself eaten potatoes that were quite black when cooked, several times, taking the dose with shut eyes, but willingly as a test of this question; so far nothing has happened to me.

SURE DEATH TO LIVEFOREVER.

W. H. C., EAST FREETOWN, N. Y.—I have found a much easier and more effective way of destroying liveforever than that described by W. H. D., in the RURAL of October 5. First procure a root of diseased liveforever and set it out in a bed of liveforever and it will kill the pest for rods around, the first year, and continue to spread and kill it as long as any remains in the field. When it once gets started in a field, liveforever is sure to go. Not a branch of it will be left to mark the spot where once it had perfect sway.

HAY FROM DIFFERENT SOILS.

G. M. O., MEADVILLE, PA.—My observations, extending over a period of 14 years, lead me to the conclusion that hay has not always the same feeding value, varying with the soil on which it is grown. My farm is situated in a valley, and I have both bottom land or flats and hill-side; the flats are clay land and sandy loam, the hill-side gravel: the hay raised on the gravelly soil while not always as heavy a growth, always gives the best results in feeding. You can satisfy the cattle with it and they thrive better than on hay raised on the flats. The hay on the flats is always lighter and the cattle do not always like it as well and they eat a greater bulk of it (I think the cold nights especially when moist, have something to do with it). We can raise more hay on our flat land, and the meadows are smoother, so we are more apt to cut our hay there, but it is not as good to feed. I have always had my cows shrink in their butter when turned into pasture on the flats from off hill pasture. There may be some deficiency in the flat soil that causes the difference in the feed, flavor and feed value. I know that when we want good, well-flavored potatoes for our own use, we do not plant them on the flats; they are not dry and mealy as raised on our gravelly soil, or as good-flavored. There is a vast difference in small grain

raised on the hill-side and on the flats. The grain is not nearly as heavy or plump, nor does the wheat make as good flour. Now if soil has a marked influence on other things, why not on hay?

What Others Say

IDAHO PEAR.—A very interesting, conservative illustrated pamphlet is received of this promising fruit, with a colored picture as a frontispiece. As our readers are aware, the R. N.-Y. is in fact, as is freely acknowledged by the company introducing it, responsible for its quick appreciation. Without the slighest acquaintance with the originators or with those who forwarded specimens to this office to prejudice in its favor, we were struck by its odd shape, its being seedless or nearly so, its excellent quality and with its decided superiority to any other pear of its season. The Idaho, as it has since been named, was therefore described and illustrated in its issue of November 27, 1886. It is not known, of course, how it will succeed away from its place of birth; but in so far as can be judged it is one of the most promising novelties among pears that has ever appeared, and we are free to advise our readers, North, South, East and West, to give it a trial in an experimental way. To aid in the dissemination of new *improved* fruits is a matter that the R. N.-Y. has always had at heart, regardless of advertising patronage, as its record during the past 12 years must abundantly show. We quote from the pamphlet above alluded to:

"During the fall of 1886, Mr. C. T. Stranahan and J. H. Evans, of Idaho, about the same time and each without any knowledge of what the other had done, sent specimens of the pear East, Mr. Stranahan sending to the American Agriculturist and the Farm & Garden; Mr. Evans to the RURAL NEW-YORKER. The Editor of the R. N.-Y. being absent from the city when the pear was received, it was somewhat damaged by being over-ripe when tested. Notwithstanding this, he was struck with it at first sight, and wrote immediately, requesting a better specimen for illustration in the RURAL NEW-YORKER! The season of the year being past, only a small pear or two were to be found on the trees that had been left as not worth gathering; these were immediately forwarded, and from one of them was made the first illustration of the Idaho Pear. The specimen shown in the engraving was very much flattened, and there were probably few persons who without any knowledge of the fact would have guessed the uncouth-looking figure to represent a pear. The novel appearance of the pear, and more especially the high encomium of praise awarded it by the Editor of the R. N.-Y., elicited immediate public attention, and the day following the receipt of the RURAL NEW-YORKER, letters were received making inquiries in regard to the pear, and requesting cions for testing, nor has there been any cessation of public interest during the past three years, as attested by the hundreds of letters that have been received. A few admiring friends of the Idaho Pear, believing from the warm words of welcome that had been awarded the first few specimens that had been sent abroad, that lovers of good fruit everywhere would appreciate this most excellent pear, resolved upon making a systematic distribution of the stock and hence the Idaho Pear Company.

At the time the first specimens of the fruit were sent abroad the Idaho had been variously designated among the few who had any knowledge of it as the Mullkey or Lindsay Seedling Pear. Upon receipt of the letter of the Editor of the R. N.-Y. requesting a second specimen and containing such a high commendation of praise, Mr. Evans concluded its good qualities were as likely to be appreciated abroad as at home and that it was entitled to a more characteristic name, that its distinct and rugged form was indicative of the land of its birth and that it could go forth under no more suggestive name than that of its native place —Idaho—The Gem of the Mountains.

In the pamphlet alluded to, high praise is given to the Idaho Pear by such good men as Prof. Budd, J. J. Thomas, Dr. Hexamer, Parker Earle, P. Barry, P. J. Berckmans, Dr. Hoskins, Waldo F. Brown, T. T. Lyon, W. Falconer, Storrs & Harrison Co., T. V. Munson, H. M. Engle, etc. The pamphlet will be sent to any of our readers upon application to the Idaho Pear Co., Lewiston, Idaho.

"WHY MONTANA IS BOOMED.—Under the heading 'A Serious Matter,' the RURAL NEW-YORKER, in its issue of September 7, draws aside the curtain and allows its readers to look behind the scenes and learn why it is that certain newspapers—and especially the Orange Judd Farmer—are so persistently booming Montana in their editorial columns:"

The above is quoted from the Iowa Homestead of September 20. The Homestead then quotes the editorial alluded to in full and then goes on to say:

"There is nothing new in the above, so far as newspaper publishers are concerned. The Editor of the Homestead had a polite invitation from certain railroad officials to become the guest of their road, in company with a coterie of distinguished agricultural editors, when this scheme was first organized. Not wishing to be under any obligations to any railroad, we declined the invitation. We have watched the development of the scheme ever since. While the other editors have been quite decent about it, and have evidently refrained from making representations that might mislead the unwary, the Orange Judd Farmer has thrown itself so fully into the work of editorially booming Montana as to awaken the suspicion that it is merely an advertising hand-bill of the Manitoba Railroad. We presume it is its privilege to do so, but, having taken this position, it is scarcely reasonable that it should ask to be classed with legitimate agricultural newspapers."

SAVING WAGES FOR FARM HANDS.—Waldo F. Brown in the columns of the Albany Cultivator and Country Gentleman, strives to impress on every farm hand the importance of saving and safely investing a part of his wages. If he saves $100 the first year of work, it may be worth more to him than $1,000 a few years later. Mr. Brown would much rather a son of his should earn by his own labor $100 the first year he was his own master than to have him make $1,000 by speculation, and if he found that he had saved three-fourths of his wages he would feel that his financial future was safe. He has had four hands during the last five years, and but one of them saved a dollar of his year's wages. It looks like a slow way to get a start in the world, to lay up a paltry hundred dollars a year, but he who does it, in a few years has enough to buy a team and tools to begin as a renter, or to make a payment on a piece of land which will be a home for him. Mr. Brown has met at institutes and other farm gatherings during the last 10 years thousands of the leading farmers of several States, and he has often been surprised to find that the best and wealthiest among them began life as farm laborers, and fought the battle of life single-handed. He has three neighbors who began as farm hands within 12 years, who worked by the month until they had saved $500 or $600 each, then rented farms, and who have now bought them. They were all young men who took an interest in their work, never thought of the 10-hour plan, and whose wages were increased from year to year. It took Mr. Brown three years of hard work to save $300, but those $300 were worth to him more than he could possibly have foreseen at the time. There are plenty of openings on the farm for young men of pluck and principle, and the chances of success are as good now as when he started.

CONCENTRATION OF WEALTH.—In regard to the concentration of wealth in the United States, Thomas G. Shearman says, in the Forum, that as lately as 1847 there was but one man in this country who was reputed to be worth more than $5,000,000; and though some estimated his wealth at $20,000,000 there is no good reason for believing it to have been so great. At the smallest reasonable estimate, there must now be more than 250 persons in this country whose wealth averages over $20,000,000 for each. But let us call the number only 200. Income tax returns arranged in large classes, multiply by from three to fivefold for every reduction in the amount of one-half. For extreme caution, however, we estimate the increase in the number of incomes at a very much lower rate than this. At this reduced rate, the amount of wealth in the hands of persons worth over $500,000 cash in the United States would be about as follows:

200 persons at	$20,000,000....	$ 4,000,000,000
400 persons at	10,000,000....	4,000,000,000
1,000 persons at	5,000,000....	5,000,000,000
2,500 persons at	2,500,000....	6,250,000,000
7,000 persons at	1,000,000....	7,000,000,000
20,000 persons at	500,000....	10,000,000,000
Total.....		$36,250,000,000

The estimate is very far below the actual truth. Yet, even upon this basis, we are confronted with the startling result that 31,000 persons now possess three-fifths of the whole national wealth, real and personal, according to highest estimate ($90,000,000,000) which any one has yet ventured to make of the aggregated amount. Nor is this conclusion at all improbable.

WIDE-AWAKE ITEMS.

THE DIAMOND GRAPE has not as yet borne fruit at the Rural Grounds. A vine was sent to us b J. T. Lovett in April of 1887. This was raised among a lot of 2,500 seedlings by Jacob Moore of Brighton, N. Y., the originator of the Brighton Grape, who deemed it the best of the collection. Nearly everything is claimed for it, vigor, hardiness, healthiness of vine; earliness and perfection of the berries.....

HOARD'S DAIRYMAN says, that, ton for ton, many farmers are finding out that unthrashed oats cut when the grain is in the rather soft dough state, and cut fine with a straw-cutter, are better than meadow hay—cut equally fine—to feed cattle, especially milch cows. As a rule, good farmers raise far more weight of oats to the acre than hay.....

THE FARM JOURNAL insists that calves, colts and all young animals should be treated so that they will come to you as to a friend. If you feel ugly and must kick something, let it be a log or a stone wall, or something that will not suffer. A few experiments in this line may cure you of the habit of feeling ugly.....

OUR "What Others Say" column is not as lively as usual this week. We are very sorry, but are you going to hold us responsible for the shortcomings of our contemporaries?.....

GO TO the woods; find a Papaw and transplant it to your own garden. In 10 years it will make you a thickly foliaged little tree, and it will bear its banana-looking fruit to eat if you like its sweet, custard-like flesh.....

A CORRESPONDENT of Mr. Peter Henderson, says Garden and Forest, recently sent to him, from France, a cluster of grapes upon which some of the berries were green, some black, some half green and half black —the colors divided sharply by a meridian line—and some were striped green and black. This seems like another example of the influence of strange pollen. But a letter which accompanied the grapes stated that all the clusters were mottled in the same way, and had been every season since it began to bear, some nine years ago. The vine is a seedling of unknown parentage...

THE R. N.-Y. is right glad to see that Secretary Rusk indorses Ex-Secretary Colman's recommendation that the Washington seed business be transferred to the experiment stations.....

THE Wilder Pear is well worth a trial....

A GOOD DEAL of space will be given next week to potatoes. The RURAL is sad that its own reports will not be of a nature to give doubting Thomases a chance to cavil as of yore.....

A FIRST-RATE small tree for a brook-side or wild garden is Aralia spinosa—well called the Devil's Walking-Stick.....

DIRECT.

—WESTERN RURAL: "Perhaps you are close in making a bargain, want every cent that is coming to you, and expect people to do just as they agree. That is all right. If you pay every cent you owe and do just as you agree, you can afford to be called mean, and we will venture to say that those who know you most intimately will say of you: "He is close, but he is a good husband and father and friend and a very nice man."

—LONDON AGRICULTURAL GAZETTE: "The late Mr. J. J. Mechi's farm is in the market. It seems but the other day that the genial farmer of Tiptree Hall, still enamoured of his lath-floored cattle boxes, his irrigation, and his thin sowing, was showing us round his beloved domain. And what a cheerful faith the "old man eloquent" had in himself and his theories, in spite of all his misfortunes. It was not farming that ruined him, though he must have lost a good deal by its costly improvements, in spite of his balance-sheets which partook of his sanguine character. Tiptree Hall has long ceased to attract attention; but it will be associated with the bold farmer who attracted world-wide attention 20 years ago."

—E. P. POWELL, IN POPULAR GARDENING: "The hollyhock is my pride. I do not know a finer plant, all in all, than this malvaceous giant. It stands on my lawns in at least 50 distinct shades of color—from black and red to yellow and white. Everybody enjoys them; and visitors drive 10 miles to examine them, and ask for seeds."

—"Over all sheds and barns should grow grape-vines and running roses. The shame of our homes is that we run lawn mowers in front and keep Gehenna in the rear. Nothing can be conceivably more vile than the average barn surroundings of our American homes. A new departure here is sorely needed."

—CENTURY FOR OCTOBER: "The mischief of opinions formed under irritation is that men feel obliged to maintain them even after the irritation is gone."

—"VOTES should not be counted, but weighed."

—"THE small writer gives his readers what they wish, the great writer what they want."

—"TO be content with littleness is already a stride towards greatness."

—LIFE: "Soup a la Jay Gould: Take a little stock, six times as much water, and then put in the lamb."

—BADGER (mad and excited): "Say, your dog ate up seven of my hens last night. What are you going to do about it?" McGall: "Well, if it don't make the dog sick I won't do anything about it."

—MOTHER: "You have drawn that donkey very nicely Johnny, but you have forgotten one thing. Where is his tail?" Johnny: "Oh, that donkey does't need any tail. There are no flies on him."

—GARDEN AND FOREST: "The Shiawassee Beauty Apple rises higher in my esteem year by year, as I become better acquainted with it. This season, when there are but few apples, and of these few most are ruined by insects, Shiawassee is large, fair and perfect. A seedling of the Fameuse, it is yet quite distinct, being larger, more flattened, more brightly red, and distinctly more acid, though with the true Fameuse flavor. The tree is very hardy, having endured several of our severest winters; and, above all, in point of comparative merit with its parent, it is free from the fungous spotting so ruinous to the Fameuse." T. H. HOSKINS.

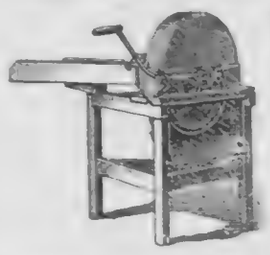
Miscellaneous Advertising.

Hood's Sarsaparilla 100 Doses One Dollar

Scrofula in its severest forms, salt rheum, and all other blood diseases, are cured by the great blood purifier, Hood's Sarsaparilla. The voluntary statements of cures by this medicine are really wonderful. Send for particulars to C. I. Hood & Co., proprietors Hood's Sarsaparilla, Lowell, Mass.

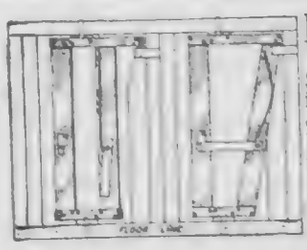
NOTHING ON EARTH WILL MAKE HENS LAY LIKE SHERIDAN'S CONDITION POWDER

Highly concentrated. Dose small. In quantity costs less than one-tenth cent a day per hen. Prevents and cures all diseases. If you can't get it, we send by mail post-paid, One pack. 25c. Five $1. 2 1-4 lb. can $1.20; 5 cans $5. Express paid. Testimonials free. Send stamps or cash. Farmers' Poultry Guide (price 25c.) free with $1.00 orders or more. L. S. JOHNSON & CO., Boston, Mass.



DICK'S FEED CUTTER

For Hay, Straw and Ensilage. *The only machine that cuts and splits corn stalks.* We also sell the TRIUMPH STEAM GENERATOR, and GRIFFING'S CORN SHELLER AND SEPARATOR. Write us at once **H. B Griffing, Sons & Co., 70 Cortlandt St., New York City, N. Y.**



BOON to DAIRYMEN

Perfect Swinging Cow Stanchion. Self-locking by entrance of cow's head. Free delivery at principal points. Send for circular. Mention this paper. **Scott & Locke, Orford, N. H.**

THE
RURAL NEW-YORKER,
(34 PARK ROW, NEW YORK),

A National Journal for Country and Suburban Homes.

Conducted by
ELBERT S. CARMAN.

SATURDAY, OCTOBER 26, 1889.

NOTICE.

THE RURAL NEW-YORKER is invariably discontinued at the end of the term subscribed for. Any copies sent to non-subscribers are sent without charge as specimens merely.

IF the standard of purity fixed by law is a certain per cent. of solids, are not the producers of such milk—as some of them claim—justifiable in watering their milk down to the legal standard? The chemists cannot tell the difference, and yet if the milk-owner should be detected putting water in such milk, though it be above the standard, he could be arrested, and if proved guilty, must pay the penalty or go to prison! See page 710.

AT the Minnesota Experiment Station a "school for meat inspectors" has been established. It is proposed to give such instruction as will qualify men for the duty of "inspection on the hoof." In spite of the adverse decision of the courts, it seems evident that Western farmers look to this "meat inspection" as the best means of handling the trade in dressed beef. The probabilities are that efforts will be made to push a law having this inspection for its basis, that will be so framed as to be declared constitutional.

OUR friend A. L. Crosby, has this to say about a matter that would please many farmers:

"The Blush Potato, by the way, is improving. It used to scatter very much; there would be almost as many potatoes between the rows as in the rows; but now they are much more sociable, and there is no trouble in digging them with a potato plow."

Can it be that the location of the manure or fertilizer has anything to do with the position of the tubers? Will a concentration of the manure in the hill or drill tend to produce a concentration of the tubers?

SOME of our friends have manifested a good deal of concern about the adulteration of buhach. It has been claimed that Eastern firms adulterate the California product. A friend in California writes as follows concerning the matter:

"Inquiries have been made throughout the country in regard to buhach which is retailed at every little cross-road store. While much of it does not seem to be up to the standard quality, no incident has yet come to light in which direct fraud can be proven, although there is but little doubt that in some instances it is practiced. The crop of buhach in California this year is very good, but is not in excess of the demand."

SOME of our impatient friends want to know why we do not tell them more about the famous butter extractor. We have already given about all the *facts*. We might print any amount of theory and philosophy about the machine, but the actual facts can only be demonstrated by practical results. Will the extracted butter keep? Will the machine supersede creamers and pans and churns? Will the dairy business be "revolutionized?" There are plenty of men who stand ready to give an opinion regarding all these matters, but the actual results will have to be worked out in the old, old way. When any facts regarding the quality of extracted butter or the economical value of the extractor are presented, the R. N.-Y. will gladly give them.

EFFORTS are being made to render the coming New York farmers' institutes very valuable. Secretary Woodward informs us that he has secured the services of Prof. J. W. Sanborn, recently Director of the Missouri Experiment Station. The other workers who proved so popular last winter will all report for duty. It is proposed to hold 40 institutes this year, although if all the places that call for one could be served there would be 100. The first will probably be held November 18 and 19. The R. N.-Y. will print a full list of the locations as soon as it is decided upon. It is not necessary for the R. N. Y. to repeat that it is most heartily in favor of this institute work and that it urges all its friends to attend all the meetings possible.

THE recent decisions regarding the constitutionality of certain anti-dressed-beef laws promise to provide some interesting test cases regarding game laws. Many Western States have laws forbidding the exportation of certain kinds of game from the State at any time of the year. The decision in the dressed-beef cases was based upon the fact that Congress has the sole right to regulate the traffic between the States. Game dealers in this and other large cities claim that if the State authorities have no right to prohibit the entrance of dressed-beef they have no right to prohibit the export of game. They propose to test the matter. The prohibition of game exports has hitherto proved one of the best means of preserving game from market sportsmen.

THE R. N.-Y. the past spring for the first tried the effect of spraying an apple-tree with water and Paris-green. The tree (Newtown Pippin) is about 14 years old from the nursery, and has borne for four seasons without maturing a single apple, so far as known, that was not injured by the coddling moth. It was first sprayed when the apples began to set and the tree was not entirely out of bloom. It was again sprayed four days after, and again when the apples bent from an upright to a downward position. It bore a moderate crop and though every apple was examined there was not a trace of the coddling moth. The quantity of Paris-green used was a level teaspoonful to two gallons of water. It was sprayed on *every* part of the tree underneath and over the leaves, through a Vermorel nozzle. The experiment was conducted in a small way certainly, but it proved what the R. N.-Y. desired to prove for itself, that thoroughly spraying apple-trees will insure the destruction of the coddling moth without the slightest apparent injury to the foliage.

THE losses recently incurred and likely to be incurred soon by Eastern companies engaged in making loans on Western farm mortgages should teach a salutary lesson. There has never been any system of inspection or supervision in case of loans made by such corporations. In their eagerness to earn commissions and to make prompt use of the funds entrusted to them, they have often taken unjustifiable chances and accepted insufficient security. Indeed the people of the West have been hardly more anxious to borrow than the people of the East have been to lend. In many cases farmers have been over-persuaded to take loans when they could have done without. Tens of thousands of Eastern money have been invested in mortgages solely because the rates of interest were irresistible, without any proper investigation into the value of the land or the borrower's ability to pay. Even decisions of the courts were neglected in the greed for high interest. The reaction from such feverish imprudence must be expensive; but it is safe to say that the vast majority of Western farm mortgages are good, and that they will be duly paid as fast as they mature.

WHEREVER the Grange or the Farmers' Alliance establishes a store or depot for furnishing its own members with supplies at first cost, there is always a tendency to excite the ill-will of other store-keepers in the place, and also that of their friends. This is quite natural. The goods furnished are good and unadulterated; and even the general public can usually purchase them for the same prices charged for ordinary goods of the same kind elsewhere, and sometimes for lower figures. So long as human nature remains what it is and always has been, such competition must beget ill-will. The farmers very naturally support their own side, but it is seldom the feeling finds vent in violence. An exception has just occurred at Dothen, a small town in Alabama. The Farmers' Alliance had established a farmers' warehouse there. As soon as it began business, it was called upon to pay the usual drayage and other licences imposed on other business houses in town. This demand was refused and the manager was arrested. On the day set down for his trial 300 heavily armed Alliance men assembled round the Court House, and the town's people also came armed to the teeth. A pitched battle took place between the two parties, which resulted in the death of two men on each side and the wounding of many more. Such events are truly deplorable, and in this case all the more so inasmuch as the farmers appear to have been most in fault.

IT IS very evident from the notes on "Marketing Crops" printed in this issue that the R. N.-Y. has among its subscribers some very keen and shrewd business men. "Selling a crop is just as important as raising it," We feel sure that our readers will appreciate this opportunity of comparing notes. While the products and practices of different sections are different, there are certain laws that hold good the country over. The Iowa farmer, with his great herd of cattle or horses, may wonder at the New Hampshire man with his 2,000 hens; yet in selling their different products they are both guided by similar laws of supply and demand. They are both after the highest possible price; they hold their products only when it seems evident that the supply is limited. To the business farmer a true report of the condition and location of a certain crop is of more importance than present prices. The cost of holding a crop is considerable: shrinkage, waste and proper storage must all be taken into consideration. We notice that most of our correspondents seem to agree that in the majority of cases it is safer to sell the crop as soon after harvesting as possible, unless the facilities for storing it are of the best. If farmers could so organize their business that they could tell approximately what it costs to produce a crop, they could easily determine the profit in current prices. We are speaking now of articles that can be kept for a reasonable time. With fruits and other perishable products, of course nine out of every 10 growers must sell for the market price or lose the whole.

$10.

THE R. N.-Y. offers a prize of 10 dollars for the best column of "Notes on a Back Number." Contestants may select any number of the R. N.-Y. for 1889. They are to write short notes in approval or criticism of the various topics discussed in that number. The articles must not be over one column in length. The prize is to be given to the column showing the most sense, and in which the greatest number of topics are discussed. It is proposed to publish all the essays in the form of a "Discussion" symposium.

NEW IDEAS.

"I OFTEN wonder what there *can* be left *of interest* to publish. Having read your paper seven or eight years, it seems you must have covered all the ground. But I am agreeably astonished to find every copy fully as good and fresh and new as the one before it." Thus writes a subscriber in Wisconsin. The R. N.-Y. has often wondered why its esteemed contemporaries do not get a little more "out of the rut." Now and then we compare their current issues with the corresponding dates of previous years, and it is quite astonishing to see how little real progress has been made. The same things are talked about in almost the same language. The R. N.-Y. in its farm life comes upon thousands of new and interesting things that are well worthy of thought and study. We take great pleasure in investigating what to us are new matters, and one subject leads to another until we realize that the science of agriculture is full of pleasant and profitable mysteries. The R. N.-Y. is blessed with a constituency of thoughtful and observing readers who are always ready to contribute from their fund of experience. As its circle of correspondents widens the R. N.-Y. is very agreeably surprised to see how many there are who are patiently and systematically studying the laws of Nature and the various conditions of farm life.

Such minds crave new ideas and strong thoughts from sections of the country where there are special conditions to be observed. We find that young farmers in particular want to think and reason out agricultural propositions. It is for this reason, among others, that the R. N.-Y. makes a strong feature of the 'symposium" and encourages its readers to discuss whatever may be said in these columns. Our agents often meet farmers who say: "One number of the agricultural paper is just like another. I want something *new*." This is a fair criticism of too many of our farm papers. The student, the progressive man, be he farmer, lawyer, doctor, or what not, must grow and investigate and absorb new things. One cannot successfully stand still in these days—one must go forward or fall behind. The R. N.-Y. addresses itself to progressive and enterprising farmers who desire to keep up with the times and to know all that is going on.

BREVITIES.

DON'T let that old horse get too poor before winter sets in.

THE market was never so well supplied with hickory nuts or so poorly supplied with chestnuts.

"I OWE my success as a gardener to the R. N.-Y., and I shall never be without it.'
Leadville, Colo. W. J. P.

IF anybody can give a better egg food for winter than that suggested by Mr. Jacobs on page 710, the R. N.-Y. wants to know what it is.

IN William Falconer's article on Henderson's Bush Lima, page 690 of last week's issue, "weighs 63 ounces" should read weighs 6¾ ounces.

CAN anybody tell us why there should not be State Associations formed for the New York breeders of Holstein-Friesians, Jerseys and Short-horns?

ON the farms near New York almost all the oats are bought. Farmers feed a good many oats to their horses, too, particularly during the marketing season. It would seem as though oats would be a good crop for the "city farmer."

IN almost all neighborhoods there is a farmer who grows a small crop of buckwheat, has the grain ground into flour and then peddles it out among his neighbors. The chances are that this member of the community will do well this year.

TWO WEEKS AGO the R. N.-Y. gave a detailed account of the new business of selling produce at auction. Thus far the business has been confined mainly to fruits. Last Wednesday the first auction sale of sweet potatoes occurred and resulted very satisfactorily.

IN many parts of the West potatoes are bought at 30 cents per bushel. They are being sent to this city where the consumers are lucky if they can buy at $1.00 per bushel. It would be quite an interesting study to trace this business through and see who gets the 70 cents difference.

A GREAT many silos have been filled with clover this past season. A great many farmers are regarding these experiments with a feeling of misgiving. The R. N.-Y. believes that a great majority of them will be agreeably disappointed, especially when they realize how difficult it would have been to cure the clover just right.

A HEAVY crop of fodder-corn will take out of the soil about all the manure you can put in. Many a farmer has proved this to his sorrow by manuring heavily and then sowing thickly the large B. and W. Corn. He gets a rank growth, but the succeeding crop tells a story of weakness. In many cases a crop of the smaller varieties of corn would yield as large a crop of edible fodder and leave the soil in much better form for succeeding crops.

YOUNG JESSE HOYT who inherited about $600,000 from his father, the late millionaire Jesse Hoyt, is holding up a wheat "corner" in this market "by the tail." The manly young plunger has been quite successful in the wheat pit for the last two or three years and is now "long" on 2,000,000 bushels of December wheat. He refused to make a profit at 89 cents per bushel the other day, in the confident expectation that the market will go higher before it goes much lower. "Old Hutch" in Chicago appears to be of the same opinion, as he is reported to be preventing a decline there by the power of his millions.

The Swineherd.

THE HOG AT THE SOUTH.

E. A. BISHOP.

Hog-raising in the South a neglected business, hence neither profitable nor popular; advantages of an Essex-Berkshire cross; corn and sorghum for "soiling;" sweet potatoes and peanuts fine pork-makers; feeding to avoid disease; a local market.

IN the South, where hog meat forms such an important article of food, there are few things of more moment in the economy of the farm than the raising and curing of meat for home consumption. There are, however, but few who raise sufficient for home use, the great majority depending upon the West for their supply. This should not be so, for we can raise pork as cheaply and of as good quality as the Westerners. The average Southern farmer has no piggery, or at best but a makeshift of a few old rails made into a little pen without covering, and used for a few weeks in the fall and then torn down. The rest of the year the hogs shift for themselves to a great extent and run at large in the highway, making their headquarters for sleeping just outside the front fence and in the barn-yard. With such care it is not to be wondered at that pork-raising is not popular or profitable. The pigs should have a good pasture to themselves, with running water if possible.

I have no suitable pasture and am compelled to keep mine up a large portion of the time. I find, however, that my hogs add no small amount to the income of the farm. Of prime importance is the breed, and right here at the outset is the source of much profit or loss. Much time and food are wasted every year by raising the razor-backed, piney-wood rooter that, at his best, is composed largely of bone, hair and muscle. I have found that the hog best suited to my needs, is a cross of the Essex and Berkshire. I use a thoroughbred Essex boar upon selected Berkshire and grade sows. This gives me a thrifty, quick-growing pig, with small bone and a fine quality of meat in the most desirable parts, and a small amount of offal. The demand is for small to medium rather than large hogs, an eight to 12-months-old pig weighing in the neighborhood of 200 pounds being a convenient size to handle and cure. The course of feeding that I find most profitable is to feed just as little corn and whole grains as possible; a small amount just before killing time being all I use. This is the whole-ear corn ground in a Scientific Mill and used to help out the swill and green feed for the last few weeks. What I do feed is first the waste from the kitchen and from the garden vegetables.

I sow drilled corn and sorghum in succession, which are cut, a small load at a time, and brought to the barn to be fed out. This makes the bulk of the feed and takes the place of a pasture. The hogs are given fresh water to drink every day. Aside from this, I have one lot of land—10 acres—which is inclosed with a tight fence and here, besides other crops, I plant sweet potatoes and peanuts, and in the fall, after gathering enough of the potatoes and peanuts for seed and home use, I turn in my pigs and let them get the rest, staying until the feed gives out or the weather becomes too wet and cold.

For a valuable and cheaply raised hog food I would recommend peanuts. Twice as much peanut feed can be raised to the acre on the same land as of corn, with no more work in cultivating, and there will be no labor in harvesting, as the hogs can do that themselves. The sweet-potato vines after the crop has been dug also make a valuable addition to the food supply. I intend to try silage this winter when my other feed gets low, also several hundred bushels of turnips. The latter I shall cook.

The general health of my hogs is excellent, sick hogs and cholera being something I have had no experience with at home, though my neighbors often complain of heavy losses. A little sulphur put in the swill barrel occasionally, and charcoal thrown into the pens will aid in keeping up the thrifty condition of the herd. Charred corn cobs are also good. In short, feed corn sparingly and use, instead, green food which we can obtain in abundance, and at much less cost during the greater portion of the year. All of my hogs are consumed or sold fresh without curing, as I find this the most profitable way of disposing of them, there being always a good demand, and there is much less trouble than in cutting and packing. Still I much prefer pork put up in the New England way—in brine—than with dry salt, as the meat does not become so hard and has a better flavor. For killing, a sharp, cold day is preferable and the water should be brought to a temperature of 160 degrees or at least between 150 and 170 degress. A cheap thermometer will be found of service here. A small shovelful of hard-wood ashes well stirred into the tub of water, will aid in making the hair come off easily. Care in dressing helps wonderfully in selling if one wants a good price.

Farm Topics.

WHAT TO DO WITH THE STRAW.

Shouldn't be burned, or allowed slowly to rot in a pile in the field, or sold except for fertilizers; may be exchanged for manure; should be kept covered; as yard litter; its great value as supplementary feed; as bedding for stock; as a blazing insect destroyer; as a winter mulch for wheat.

SOME farms owing to the particular composition of the soil are very productive of straw, and the farmer is sometimes puzzled to know what to do with it. The alluvial land lying along rivers and creeks usually produces an average crop of grain, and a very heavy growth of straw. As I own such a farm myself and have given the subject much consideration, perhaps I am able to offer some useful suggestions in regard to the proper disposal of the straw. In the first place, let me mention what should *not* be done with it.

It should not be burned. Burning straw, though very common in the West, is not much practiced in the East; but I have sometimes seen the smoke of burning straw piles on the flats along the Susquehanna River. Last year the buckwheat straw which was thrashed in the field and is not considered of any value for feeding to cattle, was generally burned as soon as the machine was moved out of the way.

It should not be allowed to rot in the field where it is thrashed. When there is not sufficient barn room, part of the grain is frequently thrashed in the field, and a big pile of good, bright straw is left for several years to be an eye-sore in the field, to be plowed around, to furnish an asylum for rats, mice and other vermin, and finally, when rotted down, it makes but a small quantity of manure without richness or strength, and it is seldom spread to obtain the little value that remains in it. I believe that of the two practices, the burning is the better, as it gets the straw pile out of the way at once, and the ashes, if carefully gathered up and spread, are of more value than the dust of the rotted straw.

It should not be sold. In Great Britain, where good farming is more general, and more pains are taken to make and save manure, selling straw from the farm is considered an unpardonable sin, and is strictly forbidden in most of the leases to tenants. Of course, near the cities and large towns straw is sold and manure bought to supply its place on the farm. I have often exchanged a load of straw for a load of manure—say half a ton of straw for a ton of good horse stable manure—and the person with whom I made the exchange brought the manure to my field and took home the straw. There are teamsters here, and I presume in every neighborhood, who have no farms and have more manure than they need for a garden, and are always willing to exchange it for straw. Long, bright rye straw is in great demand for making paper and sometimes fetches nearly as much as hay. It might answer to sell rye straw and with the money it brought buy some bone-meal or other commercial fertilizer that has been found beneficial to the soil, but the great danger is that the straw would be sold and the fertilizer would not be bought.

What, then, should be done with the straw? As soon as it is thrashed, if it has been pitched out of doors, pitch it back into the barn again, or into some place where it can be kept dry. A stack in the yard, built ever so well, will get wet on top, and in the winter will have a thick frozen crust on top so that you cannot get any dry straw from it without great trouble.

The Hon. B. Laporte of this county built a straw barn on purpose for straw. It stands on a level with the basement of his barn and is very convenient for filling from the machine, which stands on the main floor. The sides are planked with 2x4 scantlings spiked on far enough apart so that cattle when in the yard can put their heads between them and work at the straw. When they have eaten all that is within their reach, more is thrown down from above, and dry straw can be obtained for any purpose whenever wanted. Mr. Waldo F. Brown litters his barn-yard with straw a foot deep or more at the beginning of winter. I think it is better to pitch it out into the yard a little at a time every day; it gets trampled to pieces better, the manure becomes incorporated with it more evenly and it decomposes faster than if a large quantity were pitched into the yard at once, when the decomposition only takes place on top, and the under side remains a long time unrotted. A large amount of straw that is bright and not weather-beaten, can be fed with profit to stock, especially to young cattle, and a larger amount still, can be used for bedding. I stable all my cattle of every age and description now, and the young animals receive a plentiful feed of straw in the morning, which they commence eating very readily, and what they leave is taken out of the mangers at night and thrown under them for bedding, when they are fed hay. It is surprising how much straw can be used during the winter for bedding cattle and horses, how much cleaner and more comfortable they look, and what a large amount of good manure they will supply.

In order to make cows and fattening cattle eat straw and thrive on it, it must be cut fine, moistened, and meal containing a proportion of rye or oats (to make it thick), must be mixed with it.

Being short of hay one season, I wintered all my stock, horses cows and eight steers, almost entirely on cut straw and meal. The steers were fatted, and I never had any cattle gain faster. The cows gave a good yield of milk and did just as well as if they had been supplied with all the hay they could eat. I am firmly convinced that most farmers who do not use silage could feed a great deal of cut straw and meal, with more profit than hay. Mr. Waldo F. Brown tells of a farmer in Ohio who, after his wheat ground is prepared, and before drilling in the seed, burns a thin coating of straw all over the field, and thinks it pays well for the straw and the labor of putting it on, by the increased yield of grain and the destruction of insect pests.

A good many farmers, after the ground is frozen hard at the beginning of winter, draw straw on their wheat fields and spread a thin, even layer all over their wheat. It prevents winter-killing by keeping a part of the snow from blowing off, and if there should be no snow, it keeps the plants warm and prevents the injurious effects of sudden changes—freezing and thawing—which destroy their vitality and push their roots out of the ground. It acts also as a mulch, keeping the surface moist and mellow and preventing it from becoming encrusted in the spring. Hogs when kept in the pen, if abundantly supplied with straw, will manufacture more manure out of it than any other animals of their size in the world. There are ways enough for the profitable disposal of straw without selling, burning, or wasting it. It requires labor to properly utilize it, but no good thing is ever obtained without the labor of somebody.

Miscellaneous.

CORRESPONDENTS' VIEWS.

STABLE MANURE.—We use stable manure on corn and grass land. It may be applied to corn land any time in the fall, winter or early spring. To meadows and pastures it is best applied in the fall and early winter. I have never observed other than good effects to follow on its application either to corn land or pastures. A too liberal application to meadows will cause the grass to grow rank and coarse and to lodge badly in a wet season, while in a dry season it only insures a good crop. Applied either to oats or wheat, it will generally cause a rank growth and lodging. I never knew it to prove otherwise than beneficial to corn. I have seen dozens of fields of corn in which a person could tell to the row where manure had been applied. Three years ago I inspected a field of 12 acres of corn, four acres of which had received a liberal dressing of good stable manure, and the difference in growth was so marked that one would almost have thought the field was planted with two distinct varieties. The four acres of manured land actually yielded more bushels of corn (I forget just how many more) than the other eight. I believe there is no crop grown that is more benefited by an application of good stable manure than corn, let the season be wet or dry.

MANURE ON POTATOES.—The effect of stable manure upon potatoes has invariably been injurious with me. It causes scab, rotting, coarse, uneven, pronged tubers, besides a growth of weeds and grass that it is almost impossible to subdue. If, after the land is heavily manured, a crop of corn is grown upon it, then it is in prime condition for potatoes. Some of the finest potatoes I ever saw grown in this section were grown on such land. I consider it next in value to well-rotted clover sod for this crop. The chief objections to it are the corn stumps which are a nuisance in a potato patch.

Christian County, Ill. FRED GRUNDY.

FEEDING HOGS.—I believe that it pays to keep the pigs of all ages growing; that is, it pays better to feed regularly a certain amount of feed rather than to turn the animals out on grass and water for three or four months, and then put them in the pen and feed all they will eat for two or three months, and then slaughter them. Breeding sows should not be fat or over-fed when suckling pigs. It is better to let them fall off in flesh than to overfeed them with strong feed. I have much faith in bran and middlings for breeding and growing stock.

REMEDY FOR LUNG WORMS IN SHEEP.—Turpentine in quantities of one tea-spoonful in a half gill of sweet milk for a 40-pound lamb, or double the quantity for a large lamb or sheep is a good remedy for lung worms. It should be given on an empty stomach and for three successive days. If the animal is badly infested, the dose should be repeated after three days. As soon as a lamb does not keep up with the flock the presence of lung worms may be suspected.

BINKUM'S TOOL-HOUSE— Binkum had the best equipped tool-house I ever saw. It was his hobby. It was as cleanly swept as any woman's kitchen floor need be. Everything was in perfect order. Plows, chains, hoes, spades, axes, were all arranged in the most orderly manner. Even the broom-sticks had been preserved until perhaps 70 had been accumulated. All implements had been cleaned, polished and oiled. It would do any man good to inspect that tool-house. The three sons would no sooner have dared to soil one of those immaculate shiny hoes by digging in the ground with it than they would have used a watch for a foot-ball. This model tool-house was kept securely locked, and was made an end instead of a means. Binkum seldom allowed himself or anybody else to use his tools. He had many a sneer for the farmers who "never had any tools." His aversion to work and love of whisky landed him in the almshouse and the sheriff dissipated the contents of the well-ordered tool-house.

Greeley, Col.

AS A HISTORICAL NOVELTY in the horticultural line, I send the RURAL an apple from the oldest apple tree on the Pacific coast, or rather from one of the group of the four or five oldest trees. The seeds were planted by the Rev. Spaulding, Missionary to the Nez Percès Indians over 50 years ago, and the trees were for about 40 years objects of Indian horticulture, and during this period—in the winter of 1861 and 62—the mercury dropped more than 40 degrees below zero, which fact certainly attests the hardiness of the trees. The one from which the fruit is sent is about 7½ feet in circumference near the ground and is still vigorous, having made a good growth the past summer.

J. H. E.

Lewiston, Idaho.

[The apple was received in perfect condition. It was about the size of a Baldwin. Skin bright yellow; flesh white, subacid, tender and of fair quality. Eds.]

GRAFTING THE TOMATO AND POTATO.—Some happy amateur, who, like our common progenitor, Adam, derives enjoyment from tilling and keeping his garden, and who has not seen a potato-ball for 10 years, has conceived the idea of growing a potato stem up close to a tomato stem, inarching them together when they have grown sufficiently, and when united stopping the tomato growth everywhere excepting through the graft, and severing the potato stem below the graft. It is possible that the potato top, having no tubers to feed, may spend it-

self in the production of flowers and seed. Every child should be taught how to produce plants, and to guide or change their growth by grafting and training as a profitable and ever interesting occupation for many a spare hour. The experimenter referred to, will, it is to be hoped, tell every body, through the papers, how his experiment resulted. "W."

CHAT BY THE WAY.

MORE than once we have had something to say about fashions in mourning—we don't mean in actual *mourning*, but in the clothes used to denote it. And there is no doubt that people more often offend canons of taste in this direction than conform to them.

It sounds heartless to tell one bereft of her nearest and dearest that she must wear just such garments for so long a time—that she must gradually lighten the gloom of her apparel until she throws it off altogether. But the wearing of mourning is a purely formal affair; the deepest black cannot express the lonely grief of a real mourner, or disguise the frivolity of one who puts it on merely because it is the fashion. It is a custom to be honored for its antiquity, and it is often a protection to the bereaved one.

* * *

BUT so many women make mourning a veritable byword. There are those careless ones who put on the inkiest of sables for a few months, and then flaunt out in gay colors without any decent interval of sober half-mourning garb. We have been repeatedly shocked by seeing women in crape veils and mourning garb at theatres and other places of amusement—at fairs and festivals of every sort. If their feelings do not prevent them from enjoying any frivolous amusement, why advertise their levity by wearing mourning? So long as unrelieved black is worn, no place of public amusement should be frequented; certainly the sight of a crape veil at a comic opera is not only absurd, but hardly decent.

* * *

NEXT to the frivolous pleasure-seeking mourner comes the perpetual mourner. How many women do you know who, because they lost a dear one three or five or 10 years ago, still wear crape and what the English term first mourning, and seem to have devoted themselves to mourning for the rest of their lives? This is especially the case among American women, because rules for mourning are not so rigidly laid down here as they are in European countries. Now, in point of fact, the deepest mourning—that of a widow—should not last more than three years, and this is longer than French fashion allows. One year of black with crape; one year of plain black; six months of black-and-white, and six months of gray or lavender is the longest mourning one should indulge in, and even this is excessive. Two years is the longest allowable for parents, brothers or sisters. It is too often either selfishness or ostentation which prompts excessive mourning apparel, nor have we the right to obtrude our grief on every one.

* * *

THERE are several Mourning Reform Associations in England, organized for the purpose of lessening the display made under such circumstances, which is often a sore task to a slender purse. In England it is customary to provide mourning, usually two sets, for the servants of the bereaved family, be they many or few, and this is a very heavy expense. Many people of rank try to discourage this ostentation, but it is an old custom. Lady Marian Alford, an English woman well known for her benevolence and philanthropy, left in her will an express stipulation that no mourning should be worn for her, and that her funeral should be as plain and simple as was consistent with respect.

* * *

WE wear mourning garments in token of a sorrow which we ought assuredly to stifle and to conquer. The loss of our dear ones seems scarcely expressed by the deepest of black, and yet we must all feel the selfishness of such gloom. Among the new hymns approved by the late Episcopal Convention is one for the burial service which is so trustful and devout that we must quote it here, at the risk of its seeming out of place:

"A voice is heard on earth of kinsfolk weeping
The loss of one they love;
But he is gone where the redeemed are keeping
A festival above.

The mourners throng the way, and from the steeple
The funeral bell tolls slow;
But on the golden streets the holy people
Are passing to and fro;

And saying as they meet, Rejoice! another,
Long waited for, is come:
The Saviour's heart is glad: a younger brother
Hath reached the Father's home."

TAKE LIFE EASILY.

MRS. S. H. ROWELL.

"WHAT an easy woman Mr. Howe has for a wife!" said Mr. Metcalf, as he laid down the paper and stretched his feet to the grate. "I never saw a person so easy and calm!"

"What have you seen to make you think so now?" said his wife.

"I never saw much of her before to-day, but when Mr. Howe had that attack in the store yesterday morning, I happened to be in the store, and so called a hack, and went home with him. Mr. Edson rang the bell and when he told her that he had brought Mr. Howe home sick, she turned as pale as a ghost, but as quickly as possible wheeled the sofa into the center of the sitting-room, had the pillows on it and a blanket before we got him into the house. She was not flurried one bit, seemed to know just what to do. She loosened his clothes, and rubbed his side, and got some medicine to give him, before she even spoke a word; then she got some hot water in a bath tub and got his feet into it. Edson and I stood by to see if we could help her in any way. She seemed adequate to the situation. She just rubbed his feet, legs and hands till he came to a little.

'He was not fit to go to the store this morning;' she said, 'he was sick all night, but he said it was necessary for him to be there this morning, as he had important business on hand.'

'Ought we not to call a physician?' said Edson.

'I will see how he is directly; but I think it was only a fainting spell. He did not eat a mouthful of breakfast, and only drank a cup of coffee,' and she was as cool and collected as I am now. Every one thought it was a fit when he fell to the floor in the store.

He struck his head against something when he fell, and there was a big bump as large as an egg marking the place. When she saw it, she bathed it in hot suds, and then got a piece of raw beef-steak and bound it on the place; then she gave him some more medicine, wiped his feet, put on his socks; and with a smile said, to him: 'You are feeling better now I think.' She was feeling his pulse, and he opened his eyes, and the color came to his lips, as he said he was getting over it.

'What folly to faint away!' he laughed, as he saw us. 'My wife tried not to have me go to the store till I was able to eat something; but I felt so sick that I could not taste a mouthful. I presume I shall be all right in an hour, so as to be back to the store this evening.'

We protested against it; Mrs. Howe said she would make him a cup of tea and a slice of toast before that question was settled. As there was nothing for us to do, and they did not need a doctor, Edson and I took our departure. Mrs. Howe followed us to the door, to thank us for our kindness, and remarked that she did not think her husband would go down town to-day. Edson and I both exclaimed, after we left the yard, upon her self-possession; and Edson said, if he had been carried home insensible, his wife would have had hysterics, and a physician would have been sent for, and all the neighbors called in, and a general hubbub would have followed while everything was so quiet and easy at Howe's."

"Did he go to the store in the afternoon, Mr. Metcalf?" asked his wife.

"No, but I called in, on my way home. He was lying on the sofa, reading. He said he was all right except where he hit his head: that was rather sore yet; but his wife was caring for it, so it would be nigh-well in the morning he thought. I saw he had a slice of beef upon it. When I spoke of his not coming to the store in the evening, he laughed, and said he might have gone, but his wife did not wish it, and he thought he had made her trouble enough for one day. Then I spoke of how calm and collected she was, and how she knew just what to do.

'Oh yes, that is her way. She takes life easy. She never gets excited, let what will turn up, and I am such a nervous fellow that it is lucky for me that she is so cool and collected. Now after you and Edson went away this morning, she just had a good cry; her feelings gave way; the tension had been too strong on her nerves. I expect she was awfully frightened; but you would never have known it by her appearance, till I was all straight again.'

We had a real nice chat, and I left him as chipper as a lark, and Mrs. Howe came in with a face beaming with smiles."

"You probably thought how your wife would have acted" said Mrs. Metcalf; "I could not have done the first thing for you."

"I do not think you would have been as bad as Edson said his wife would have been; but I rather think you would have fainted away if I had been brought into the house looking like a corpse."

"Oh, I could not have done the first thing, I know! and I do not see how Mrs. Howe could either! How could she think?"

"Perhaps she has learned to take life easy: again she may not have as excitable a temperament as you have; and, then, she may have had a different training in her home when a girl; or she may have seen the necessity of controlling her feelings on account of her husband's nervous temperament. But it is a blessing in any home for a woman to take trials easy."

"I doubt whether I ever could learn to be calm under such dispensations; but I can understand how much better it would be for all if I could. I have always heard that Mrs. Howe was one that took life easy, let what would happen."

ABOUT PERFUMES.

A WRITER in the New York Sun says that perhaps no pretty feminine sacrifice more augments woman's witchery over man than the subtle faint fragrance which she contrives to impart to the fluttering folds of her gowns and belongings. This is not produced by emptying a pint of triple extract on a handkerchief after the manner of men, but of sundry dainty devices and combinations of odors which each woman invents for herself, and which make possible a certain individuality in perfume so marked that an observing lover is aware of his lady's presence by the atmosphere, and can select her handkerchief from a dozen others by its odor. Some luxuriant women bathe in perfumed toilet waters, *à la* Mrs. Potter, whose bath of violet tincture, supplemented by quantities of violet powder, made the fragrance of her favorite flower continually emanate from her presence. Another pretty fancy with ladies is to tie up sweet grasses, clover, and rose leaves in little silken bags and place them between the folds of their wearing apparel. Sprigs of lavender and sweet verbena are folded in their lingerie, after the fashion of their grandmothers, and an ancient recipe for lavender bags, handed down from some dear, dead, dainty belle, is regaining popular favor. Its ingredients are:

One-half pound lavender flowers.
One-half ounce dried thyme and mint.
One-quarter ounce ground cloves and caraway.
One ounce common salt.

All tied up in a case of linen to be hung inside a wardrobe or chest.

A very delicate perfume is made of a combination of heliotrope and violet powder, with an equal amount of orris root, which latter is said to be an excellent medium for the other powders and helps them to retain their delicate fragrance for a longer time than they will when used alone. Small sachets of lawn or linen, shaped like an envelope the lid of which fastens with a button and buttonhole, and from which the cotton may be easily removed to be dusted with fresh powder, are favorite receptacles for the powder, which must be renewed very frequently, as its perfume is as fleeting as it is faint. These are scattered all through the folded lingerie, between the handkerchiefs, and are placed in the pockets or draperies of dresses. But the most cunning device of all, and one which never fails to produce just the faint, delicious fragrance desired, are the corsage sachets, which are made of silk or satin, are about two inches square, and of which as many may be worn, fastened inside the waist, as desired, as they are very thin and flat, and can be placed inside the corset if necessary. The warmth imparted by the fair wearer causes them to send fluttering forth the most delightful odor with every breath or stir of the bodice, until the pretty conceit of a lover that his mistress breathes fragrance is verified.

GOLDEN GRAINS.

TO be content with what we have is the real secret of happiness. The real needs of humanity are comparatively few, but the artificial and conventional are illimitable and insatiable.....

NOTHING is more expensive than penuriousness, nothing more anxious than carelessness, and every duty which is bidden to wait returns with seven fresh duties at its back.....

IT is not what life is to bring to a man but what he is able to carry into it, that will determine his happiness.....

EVERY man is his own ancestor, and every man his own heir. He devises his own future, and he inherits his own past.....

WE have not a muscle whose law of strength is not action; we have not a faculty of body, mind or soul whose law of improvement is not energy.....

THE way to do good is to be good. There must be light; then it will shine.....

FORTUNE does not change the character, but it reveals it.....

LANGUID, low-toned color or goodness never overcomes anything. It must be positive, full of blood, radiant as an angel. Then a man shall go out with a conception of goodness into the community and wherever he goes he will carry conviction to evil, so far as conviction can be produced at all.....

LOVE those who advise but not those who praise you.....

ONE ungrateful man does an injury to all those who are wretched.....

CHARACTER is indicated in little things; hence, men are judged by little things. So simple a matter as the paper on which a man writes a note has its indication of his character; and it has its bearing on the estimate which is formed of him by others...

Domestic Economy

CONDUCTED BY MRS. AGNES E. M. CARMAN.

"Ye who long for work of nobler mould,
Oh, learn how common things may aid;
Whoever digs for diamonds or gold
Must needs use first—an iron spade."

FOR MOTHERS.

MOTHERS are more apt to think of things which amuse the girls than the boys—that is, after the former reach their teens. Boys are expected to play out-of-doors most of the time, and also to select their companions outside. But the greatest mistakes boys make in their lives are often made just at this period. Then, if ever, a boy needs his mother. Let us exert ourselves to keep our lads near us.

One way to do this is to give the boys a room all for themselves. Here they can collect whatever their fancy may dictate. Do not fit it up in any great style, and do not be particular in regard to the care of the furniture. Let the youngsters have one place, at least, where they can make a dirt if they wish to. Do not growl if the floor is covered with chips; do not complain if

Miscellaneous Advertising.

When Baby was sick, we gave her Castoria,
When she was a Child, she cried for Castoria,
When she became Miss, she clung to Castoria,
When she had Children, she gave them Castoria

tools and paper are littered all about; do not find fault if they have their companions (neighbors' children) with them every evening, even though they rack the carpet (if there be one) into holes. If your boys are near at hand, you know where they are. You know that they are not at the village saloon, laying a foundation for a life of dissipation. See that they have something to read. Give them some good weekly papers, magazines, and any books which you can find that will interest them and prevent them from reading dime novels and stories of the "Old Sleuth Library" and their ilk. Do not insist that their reading matter must be entirely "goody-goody" or even good; but select things which have a good moral tone and also enough excitement to make them interesting.

* * *

THE nights are quite chilly now and mother must see that the children are warmly covered. Colds contracted now are apt to last all the winter through. For little children I think it is best to make night-drawers and stockings all in one, especially for the winter. All mothers know how hard it is to keep the little ones covered up warmly during the cold nights, and must readily see the advantage of having the drawers and stockings combined. They may be made either of flannel or canton-flannel. They are far preferable to night-gowns, for the latter are apt to become twisted or caught up, thus allowing the little feet to get cold.

* * *

KEEP the children's bed-rooms well ventilated. A child that has slept in a close, stuffy room wakes in the morning feeling tired and languid, and is very often fretful and cross. This is all wrong. If the air be pure and the little one put to bed properly, he will greet us with a cheery smile, and often before we know that baby is awake we hear the patter of the soft, little pink feet on the floor, and a voice calling: "Mamma, take baby down!"

* * *

MOTHERS, if you can possibly find time, help the children with their lessons. They will take more interest in them if you do. Have the little ones to recite to you; pronounce the hard words for them, etc. Every mother who loves her children wants to see them intelligent men and women, and if she exerts all her strength to make them so, she can have that supreme pleasure. If you are a busy mother who has to spend every spare moment with a needle in your fingers, you might get one of the older children to read aloud to all, you correcting and explaining as she reads. In this way you can do your sewing and interest and instruct the children at the same time.

DORA HARVEY VROOMAN.

SOME SIMPLE REMEDIES USED BY THE "RURAL" PEOPLE AND THEIR FRIENDS.

MR. C. paints the outside of the children's throats with iodine when they complain of soreness.

WHEN Uncle John suffers from sore throat or hoarseness he puts a small quantity of vaseline into his mouth and lets it dissolve slowly. This he repeats three or four times a day.

LIZZIE V. says that her cough mixture consists of two gills of molasses, one of vinegar and 20 drops of oil of tar. Mix thoroughly. Dose, a tea-spoonful several times a day. Shake every time before using.

WHEN Mr. C. feels that he has taken cold he gives his body a thorough rubbing with a crash towel, and then rubs a little alcohol on. He firmly believes that he has in this way "staved off" more than one cold.

MRS. V. gives the following as their family liniment for external use only: Equal parts of sweet oil, liquid ammonia and alcohol with the addition of a scant part of turpentine. Shake before using.

THE sore throat gargle at the "Rural Grounds" is made by adding 15 drops of refined carbolic acid to a quart of water. Shake *thoroughly* every time before using. Gargle four or five times a day. In the case of one member of the family who suffers from a "full" throat—swollen tonsils—a teaspoonful of powdered tannin is put into a glass of water and the patient gargles the throat with this every two hours.

MISS B. says that the great remedy at her home is *lard*. It prevents discoloration and soreness from bruises, and if well rubbed in over muscles that have been violently exercised, it will prevent stiffness the next day. Her sovereign remedy for burns is a paste of baking soda and water. Take a wet cloth, cover with the paste and bind over the burn. Should the paste become dry, wet it from the outside.

ABOUT WOMEN.

THERE are some people who like to take "a dig" at women whenever they get a chance. They say that we cannot do as good work as men, yet when given the opportunity we generally come out successfully.

The following, taken from the Detroit Free Press, show what some women can do when put to the test:

The Huntsville Democrat was founded in 1823, and was owned and managed many years by J. Withers Clay, a well-known Democrat in Alabama. Four years ago Mr. Clay was stricken with paralysis. The war had left him, as it had left many thousands of others, in poverty, and at the time that paralysis overtook him he was recovering in a measure from the disasters of that conflict.

Mr. Clay has four daughters. The eldest is Mary, and the youngest Miss Elodie, Virginia and Susie coming in between. The youngest was a clerk in the Post Office. The eldest devoted her entire time to taking care of her father. Mr. Clay had been given up by the physicians, who said he had only a few days to live. Miss Mary, who herself was an invalid, tried massage and all the advanced methods of treatment. She made a study of the subject and devoted herself entirely to her father. The result has been that Mr. Clay has partially recovered from the effects of the stroke. He is able to walk around and to understand what is said to him, although he cannot write or speak. Yet the girls manage to understand what he desires them to do. It is a remarkable fact that when Miss Mary began to nurse her father she was herself an invalid and a very slim, delicate girl. The results of the four years' care have been that she is now robust and in better health than she ever was in her life before. The two girls, Virginia and Susie, bravely took charge of the paper. Miss Virginia had some trouble with the employees at first, who thought that they could do as they pleased now that a young girl was at the head of affairs, but she speedily brought order out of chaos. One remark that she made will illustrate her energetic qualities. One of the employees had said that Susie was a printer's devil, and this remark gave great offence to Miss Susie. Miss Virginia blazed out at the person who made this remark:

"You will have to treat Miss Susie with respect," she said. "I want you to understand that I am the devil in this office, and so you can govern yourselves accordingly."

She promptly discharged those who were rebellious, reorganized the office, did everything from writing the whole paper sometimes to setting type, and when that was done went out as collector, and gathered in the shekels due. As collector Miss Virginia was a great success, and those who met the charming young women in Detroit will understand the difficulty a man would have in refusing to pay a bill that was due. She collected debts that no man could have collected, and she and her sister have made a great success of the Huntsville Democrat. Personally Miss Virginia Clay is a handsome, tall, and rather slim girl. In conversation she can more than hold her own in any company, and all in all she is an excellent example of what the ladies of the new South can do when they try.

WOMEN who have entered the field of journalism generally succeed. A number of our daily papers employ women reporters and their work invariably gives satisfaction. Mrs. Frank Leslie is an example of what a woman can do when she determines to succeed and gives her energies to her labors.

DRESS, a magazine published in the interest of women's proper mode of dressing, is published by a woman—Mrs. Annie Jenness-Miller.

THE YOUNG IDEA, of Boston, is edited and published by a youg woman—Miss Charlotte H. Allen.

THE WOMAN'S JOURNAL, of Boston, is devoted to women and their work. Lucy Stone and Alice Stone Blackwell are two of its editors.

MRS. BENEDICT, who edits a department in the Philadelphia Item, also conducts a paper called, Mrs. Benedict's Fashion Journal.

MISS MARY F. SEYMOUR, who is a teacher of stenography and typewriting in New York, is publishing The Business Woman's Journal. It is devoted to things which directly interest the business woman. It is a bi-monthly.

MANY more women who are successful in newspaper work might be mentioned did time and space permit. D. H. V. O.

CERISE says that the white of an egg is her shoe polish. The effect is good without damaging results.

MARY B. rubs her fine kid shoes with vaseline and says it is especially valuable for softening the leather after it has been wet and has dried.

A CHANGE.

TOMATOES sliced rather thick, dipped in thin egg batter and then fried, are liked as a breakfast dish.

CUT bananas in two lengthwise and fry in a very little butter. Serve hot with beefsteak for breakfast.

SWEET TOMATO PICKLES.

ONE peck of green tomatoes sliced thin without peeling. Mix a small bowl of salt with the tomatoes and let stand over-night. In the morning heat to boiling two quarts of vinegar, a pint of sugar, two table-spoonfuls of ground mustard, two small table-spoonfuls of black pepper, one of allspice and one of cloves. Slice thin 10 medium-sized onions. Drain the liquid from the tomatoes. Put tomatoes and onions into the hot vinegar and simmer until the tomatoes are tender. Put into cans and screw on the tops while hot.

MRS. JOHN A. VOORHIS.

A GOOD *round* steak—it must be from the top round and at the thickest part—is a most economical cut, and when well cooked and served immediately, it will be found juicy and of good flavor.

WILL MAIL BEECHAM'S PILLS ON RECEIPT OF PRICE, 25 CENTS A BOX.

News of the Week.

HOME NEWS.

SATURDAY, October 19, 1889.

SINCE September 1, there have been six deaths in this city alone from alternating electric currents used in lighting the streets, and 15 deaths from contact with electric wires in other places. Nine of these were also caused by alternating electric currents. This system belongs to the Westinghouse Company; the Edison system does not concern itself with alternating electric currents, and the electric currents used by it are comparatively safe, as owing to their nature and strength they will seldom or never kill. Mayor Grant of this city is waging a vigorous war against the street-lighting electric companies for not insulating their wires properly and neglecting to put them under ground where conduits for that purpose have been provided. Those parts of the city lighted by the companies have been left in black darkness during the last three nights as a consequence of an effort on the part of the companies to force public opinion to put a check on the mayor; but public opinion applauds his action..... A short time ago the National Burial Case Association—the great Coffin Trust, which controls the coffin product of the country—advanced the price of caskets 40 to 55 per cent. and sent out notices to undertakers everywhere, warning them that if they didn't join the association before October 16, they couldn't purchase any more of the association's goods—they'd be boycotted. This has roused much indigation everywhere and a coffin-makers' organization just formed at St. Louis, threatens to undersell the Trust 60 per cent. A Cradle Trust is next in order, so that everything may be "cornered" from the cradle to the coffin..... .....There are 500 cases of typhoid fever in Johnstown, Pa., owing to the very unsanitary condition of the place after the flood. Bodies of the victims are still being found at an average rate of two a day. The cheap, ready-made houses purchased at wholesale by the Flood Commissioners are hardly fit for affording winter shelter! Many are suffering from want of fire, and clothing, and winter is rapidly approaching. That do-nothing Commission, however, still clings to over $1,600,000 of the money contributed by charity for the relief of the sufferers. A large staff of well paid cerks draw regular salaries, however. Many of the contributions have never been collected it is said, many have been misappropriated or "gone astray." It is estimated that fully 25 per cent. of the contributions have been "lost" in this and other ways. This would make a loss of over $750,000 in cash, to say nothing of the losses in other supplies. Never was charity more generous; never were charitable contributions more disgracefully mismanaged..... A good deal of fuss is just now being made about the recent discovery of tin in the Black Hills. Our annual importations of tin plate amount to $35,000,000, and if we could supply our wants at home, there would be a big saving. The Engineer and Mining Journal, a pretty good authority, says that only two pounds of tin have been discovered in Dakota, and that by means of these two pounds, millions of capital have been raised in the United States, England and France, for the purpose of working the "mines." There's a good deal of talk, too, about putting a "protective" tariff on foreign tin for the benefit of the prospective native industry. A good deal of fuss certainly about two pounds of tin, which may be the result of "salting" the "mines" but the weight of authority is still in favor of the genuine nature of the discovery..... C. P. Huntington and Jay Gould are reported to have pooled their railroad interests. This would make a gigantic consolidation, but the report is probably false or at any rate "premature."..... Arrangements have been completed for holding, at Montgomery, Ala., in the early part of November, one of the most complete expositions ever held in the State. It is to be known as the Southern Exposition; but products and visitors are cordially invited from all parts of the country. Low rates have been secured on all the railroads for freight and passengers. and liberal stop-over privileges will be given. For full information apply to Mr. W. C. Bibb, Secretary, Montgomery, Ala.....The great Piedmont Exposition at Atlanta, Ga., illustrating the products of the extensive Piedmont section of the South, promises to be a brilliant success. A great deal of hubbub has been made there during the past week about the visit of Governor Hill of New York State, who is making a Southern trip to start his Presidential boom for 1892, outside his own State. It looks now as if he would be ex-President Cleveland's most formidable rival; but 1892 is half a century off yet, so far as political prophecies are concerned..... Ontario, Canada, boasts of a surplus of $1,927,514 for the last fiscal year..... Illinois is the only State where a complete record of farm mortgages is available, and it is found that, outside of Chicago, all the town and farm mortgages amount only to $123,733,098, instead of over $500,000,000 for farm mortgages alone as politicians claimed during the last campaign.....The Canadian Chinese Restriction Law imposes a tax of $50 on Chinese immigrants, and is embarassing to the British Government, which is held responsible for its dependency's act by the Chinese Government, which threatens to retaliate against British trade in the Flowery-Kingdom. It is likely that, to please England, the Dominion Parliament will risk giving offence to the people of British Columbia, by repealing the law. This would remove the last restraint to Mongolian immigration to this country through Canada, for it has been found impossible to prevent Ah Sin from smuggling himself across the border..... The original Tabernacle of the Rev. T. De Witt Talmage, the famous Brooklyn preacher, was of iron, and was burned in December 1872. A brick building with stone facings, having a frontage of 150 feet and a depth of 113 feet, was opened as its successor in February, 1874. It cost $118,000 and since then it has been enlarged and improved at an additional cost of $85,000. Its seating capacity was 2,800 and it was generally crowded when Talmage preached. Early last Sunday morning it caught fire from some unknown cause and was entirely cremated. Insurance $129,450. Talmage appeals eloquently to the general public for $100,000 more to build a larger and finer structure.....While little is being said of late about doing away with the dangerous stove in railroad cars, many of the companies have been honestly working to substitute steam-heating. The occurrence of another appalling holocaust in a railroad "smash-up" will, however, be probably needed to push the alteration vigorously ahead. Another reformation urgently needed is the introduction of an improved method of coupling cars on all the roads. Statistics prepared by the Railroad Commissioners of Iowa show that in that State alone, with 8,000 miles of railroad, 352 brakemen were killed or injured in 1888 because of the use of the common link-and-pin coupling and the hand-brake on freight cars..... Out of 142,000 Federal offices only 27,000 are covered by the civil service law; but the aggregate salaries of these 27,000 places is between $30,000,000 and $40,000,000, or nearly one-half of the annual aggregate salaries of the appointive places in the United States civil service.....Secretary Noble has decided that Senator Manderson's re-rating was illegal, and under that decision the Nebraska Senator has returned to the Treasury the special certificate sent him by Commissioner Tanner for $4,000 in payment of arrearages under the new rating. Manderson declares emphatically that he had never solicited a re-rating. Secretary Noble maintains all unsolicited re-ratings were illegal, and money paid on them will be recovered wherever possible, future pensions being retained in part-payment where it it impossible to recover the money paid.....An agitation for eight hours' work per day has already started among labor organizations. Of these the Federation of Labor, which claims 600,000 members, is now by far the largest. It has just decided to start a striking fund of two cents a week for each member. The Knights of Labor is still powerful though its membership is steadily diminishing. Chief Arthur, of the Brotherhood of Locomotive Engineers, says that if the organization shall decide to associate with any other, it must find a new chief. He firmly believes it should remain independent..... ..... President Elliot, of Harvard College, who has long been eminent as a Mugwump, has gone completely over to the Democrats. Of course both the great parties speak in very different terms indeed of this step on the Professor's part.....Five cotton warehouses, two cotton-presses, and 4,500 bales of cotton were burned at Savannah, Ga., the other day, loss estimated at $4,000,000.....Axtell in his mile against time on the Terre Haute track a week ago, not only broke his own record of 2:14, but broke the world's stallion record, made by Maxey Cobb, 2:13¼, by making the mile in 2:12. Colonel Conley of Chicago, who, it is thought, represents a syndicate, has bought the young wonder for $105,000—the highest price ever paid for a horse.....The Carnival Association of St. Paul have decided to build another ice palace this winter. The City Council will be asked to appropriate $20,000 for the building and the remaining $30,000 will be raised by subscription.... A request has been sent to the committees in charge of the arrangements for entertaining the Pan-American Congress in the different cities, begging them to omit the projected banquets as they would really prove too much for the visitors' health..... ..... A British syndicate has just purchased three big breweries capable of an annual output of 125,000 barrels, at Indianapolis, for $2,000,000..... After five weeks' hard work, only eight jurors have been secured in the Cronin murder case in Chicago, and some of these may yet be rejected as disqualified for one cause or another by the prosecution or the defence. The whole country has been shocked during the past week by a vile attempt to "fix" one or more of the jury so as to "hang" it in favor of the accused. Bribes for such action, some as high as $5,000, were offered to several men likely to be placed on the jury. Already 11 of the subordinate conspirators have been arrested, among them the private secretary of Alexander Sullivan, the notorious lawyer and ex-chief of the Clan-na-gael. Circumstances point strongly to him as being the head-center of this disgraceful conspiracy. More infamous even than the Anarchist outrages has been this whole foul Cronin business, showing such widespread corruption among people hitherto deemed honest if not honorable.....In the matter of the World's Fair New York is moving tortoise-like. Books for subscriptions to a guarantee fund of $5,000,000 are to be opened at once, and, it is thought, there will be no difficulty in securing that amount. There is less snarling at the site selected by the Site Committee, as the disgruntled editors have begun to see the mischief they have been doing. Chicago has continued to work steadily, energetically, and skillfully. St. Louis is working slowly, but persistently. Washington is waiting for Congress..... Gen. John F. Hartranft, ex-Governor of Pennsylvania, died at his home at Norristown Thursday noon. Born in Montgomery County, Pa. in 1830; graduated at Union College, Schenectady, New York in 1853, and was admitted to the Montgomery bar in 1860. Entered the war as colonel of volunteers at Lincoln's first call for troops, and served brilliantly to the end. Commanded the Third Division of the North Corps in the assault of Fort Steadman in March 1865 and was brevetted Major-General for the gallant capture of the works which had been captured by Confederate General Gordon a short time before. The title of "The Hero of Fort Steadman," commemorated Hartranft's bravery..... ..Thomas W. Giblin, examiner and general agent of the Lockwood Mortgage Company, of Wellington, Kansas, has disappeared and is said to be a defaulter to the amount of $4,000..... Last Saturday night the grave of Ralph Waldo Emerson, at Concord, Mass., was opened by ghouls and the coffin was left exposed when they were frightened away. It is believed that they wanted the skull. The coffin wasn't opened though somewhat decayed, it having been eight years since the burial. Much indignation in the town finds vent in an offer of $500 for the arrest of the miscreants. Where would the rascals find the brains to fit that skull?..... .....Senator Vest is very ill at his sister's house in Sedalia, Mo.....The total product of minerals of all kinds mined in Canada the past year was $16,500,000. The more valuable was coal, the output of which amounted to 2,658,134 tons. The gold product of the year was 61,310 ounces, and the iron product 78,587 tons..... It is reported that the entire plant of the Brush Electric Light Company has been sold to the Thomson-Houston Electric Light Company on a cash basis, for $3,250,000..... .....Edward A. Perry, ex-Governor of Florida, died at Kerrville, Texas, the other day at the age of 56.....

It is Worth Reading.

We understand a busy man's views in regard to prolixity. In these days, affairs proceed at a railroad rate, and there is no time for unnecessary halt, so we fall in with this idea momentum, and briefly call attention to the essential points of a vital matter, or rather, we let others do it for us. Here are extracts from two letters which need no further comment:

REISTERTOWN, MD., Feb. 15, 1888.

"I would like to see you and tell you what Compound oxygen has done for me. It was slow but sure. Now almost after two years, after using only one treatment, I think I can say truthfully my health is as perfect as it can be on earth. Two doctors of Baltimore examined me and said mine was a hopeless case of asthma, and I will not tell you how much I have suffered with my lungs."

MRS. MARY R. IRELAND.

A concluding extract from another letter will furnish most satisfactory reading:

MYERSVILLE, MD., Aug. 6, 1888.

"I believe the Compound Oxygen Treatment to be an invaluable remedy, because of the incalculable benefit I received from its use." REV. A. M. SMITH, Pastor of Ev. Lutheran Church.

We publish a brochure of 200 pages regarding the effect of Compound Oxygen on invalids suffering from consumption, asthma, bronchitis, dyspepsia, catarrh, hay fever, headache, debility, rheumatism, neuralgia; all chronic and nervous disorders. It will be sent free of charge to any one addressing DRS. STARKEY & PALEN, 1529 Arch St., Philadelphia, Pa.; 120 Sutter Street, San Francisco, Cal.—*Adv.*

FOREIGN NEWS.

SATURDAY, October 19, 1889.

THE most remarkable thing in England of late is the nearly unbroken list of successes of the Gladstonian candidates in the bye-elections for Parliament. In the Elgin and Nairn district in Scotland, at the general elections in 1886, the Liberal candidate was successful by 119 votes; whereas two weeks ago he had a majority of 532; while the Conservative majority of 71 in North Bucks, England, was turned into a Liberal majority of 208 the other day. In 1886 Petersborough was carried by the Tories by a majority of 289, while last week the Liberals secured the seat by a majority of 251. The very decided increase in the Liberal vote everywhere is dismaying the Conservatives. Landlord and tenant and capital and labor are, however, taking the place of Home Rule as "war cries," in the Liberal canvass. It isn't so much that the English and Scotch people are losing interest in Home Rule for Ireland as that they are realizing more strongly the nature and importance of questions more intimately affecting their own interests. The laborers are setting themselves more resolutely against starvation wages from employers; and tenants are more rebellious than ever against the exactions of landlords, and the recent enlargement of the franchise gives both classes much more influence in elections. Extremists believe that before long there will be a concurrent triumph of Home Rule and land nationalization..... For the nine months ending September 30. French imports increased 40,810,000 francs and the exports 245,534,000 francs over those for the corresponding period last year..... A school children strike has broken out in London, Manchester, Glasgow and Dundee and is spreading rapidly all over England and Scotland. The strikers are regularly organized, appoint patrols to prevent other children from attending school and often use violence in doing so. They frequently stone the windows of school-houses and mob obnoxious teachers. They demand the abolition of caning, of the study of tasks at home, shorter school hours and more time for play. In all respects the youngsters' strike is modeled on those of workingmen..... The Czar's visit to the Kaiser appears to have been quite cordial and his interviews with Bismarck very friendly. At the final separation at the railroad depot there was of course the usual amount of hugging and kissing—or perhaps a little more than usual. It is thought that the prospects of peace have been strengthened. Bismarck showed the Russian that with a firm alliance between Germany, Austria and Italy, and the assured support of Great Britain and Turkey, together with a strong desire on the part of other countries to prevent or shorten a war, there would be little hope for a triumph even for the combined forces of Russia and France. Another result of the visit appears to be a confirmation of Prince Ferdinand's position as ruler of Bulgaria. Immediately after the Czar's departure German bankers and capitalists made a large loan to the Principality, which they would not have done without assurances from high quarters that no disturbance of the present order of things would take place there in the near future. Moreover, the Prince is now in Paris on a visiting trip through Europe, and if he were not certain of his position at home he would not have dared to go abroad. What concessions the Czar has obtained for his complaisance in this and other matters, time will show..... The French Government is about to send a commission to Panama to inspect the canal works. No report of experts not employed by the company has yet been made in spite of the unprecedented amount of money laid out in the work. French public opinion now demands a thorough investigation by impartial experts.....King Malietoa of Samoa, has advised the people to elect Mataafa as their principal king. He will be satisfied himself with position of viceking. It is understood, however, that the Germans will not recognize Mataafa, so that there may be more trouble in Samoa.. .....King Louis of Portugal, aged 51, who has reigned for 28 years, is at the point of death from total paralysis of the whole body..... An explosion at Bentelee Colliery, at Langton. Staffordshire, England, last Wednesday, completely wrecked the mine, and killed 59 of the 70 men who were working below at the time.....In Servia, M. Paschies, leader of the Radicals, has been elected to the Presidency of the Parliament, and this is held to indicate the complete ascendancy of Russian influence in Servian affairs. It is said that with a Radical Congress behind him, he will be able to expel the present young king and restore the old Slav dynasty, which was expelled before the present upstart German set of princlings were put on the Servian throne. Milan and Natalie, with all their disgraceful matrimonial quarrels, would in this way be got rid of. Austria, however, is likely to veto such policy, if she can, as a Russified Servia would be a perpetual menace on her southern frontier.....Italy has made a treaty with Menelek II, the new King of Abyssinia, by which she assumes a protectorate over the whole of that country. This has an area of about 300,000 square miles and a population of about 5,000,000, mostly Christians. It is mostly an elevated table-land with an altitude varying from 5,000 to 7,000 feet in different districts. Except in the rainy season, the climate is strictly temperate. The country is capable of enormous development, and Italy, the last comer among the nations in Africa, is likely to secure one of the best of the recent prizes .....

AGRICULTURAL NEWS.

SATURDAY, October 19, 1889.

SOME of the loan companies doing business in southwestern Kansas are finding themselves in new difficulties. It was a common practice in old pre-emption days for the pre-emptors to arrange for loans on their claims prior to final proof to enable them to pay the government and to supply the necessities of life. Many of them have found it impossible to pay the interest on account of failing crops, and this has brought on foreclosure proceedings. One of these unfortunates employed an attorney to defend him. He, in common with many others, had made his loan and had all the papers drawn before his final proof was made. According to the ruling of several judges, the transaction was illegal, and the mortgage therefore void. In many cases, it is said that the agents in making loans, had dated the papers back several months; this, also, was illegal. The loan agents seem to have feathered their own nests, but between them and the borrowers, it looks as though the loan companies would be left in the lurch. This can but prove disastrous both to the farmers who wish to borrow, and to those who have money to lend. The West has depended largely upon the East for money to develop her resources, and she needs more help from the same direction, but the uncertainties that seem to surround the lending of money in that quarter will be likely to have a deterring influence upon capitalists.....

A Georgia genius has just patented a flour barrel made of cotton duck. The barrel is 12 or 15 pounds lighter than a wooden one and 10 or 15 per cent. cheaper. When empty the barrel can be pressed into a small space and shipped to the mill to be refilled. It is waterproof and stands the weather better than the old-fashioned barrel. The tests so far made of it have been highly satisfactory, it is said.....The Guernseys belonging to Vice-President Morton have been exhibited at numerous fairs this fall, and have won many prizes, gold medals, etc.....Over 2,000 tons of raisins have already been shipped East from Fresno, Cal.....A Pennsylvania farmer wants the Governor to set apart a "sparrow day," when a wholesale onslaught may be made on the obnoxious birds.....A couple were married at the North Carolina State Fair, and the spectacle attracted an immense crowd. The bride and groom, and four couples who attended them, were attired in costumes of Southern cotton bagging. The Southern people don't want jute bagging, not even to be be married in. .....The Missouri State Horticultural Society will hold its 32nd annual meeting at Lebanon, December 3—5. The railroads will give special rates, and entertainment will be provided. Those wishing special topics discusssed, are invited to submit them to the secretary, L. A. Goodman, Westport, Missouri.....

The New York State Poultry Society was organized at Syracuse, October 10, with Geo. E. Peer of Rochester, president; F. E. Dawley of Syracuse, secretary. The object of the society is to work in harmony with the State Agricultural Society in promoting the poultry industry of the State. It will furnish helpers in the institute work, and, if permitted to do so, will take charge of the poultry exhibit at the State Fair. From the character of the men composing the society, and the high standing of the officers elected, it looks as though the New York State Poultry Society had come to stay, and that it would fill the need so long existing for a first-class poultry society in this State.....

The Erie (Pa.) Chrysanthemum Club will hold its exhibition November 5-7. All entries outside of Erie must be made before November 1. The display will include, besides chrysanthemums, green-house plants, cut flowers, floral designs of various kinds, fruits, etc. A liberal premium is offered by the citizens of Erie for the best model of a flower garden and pleasure grounds. H. Tong, one of the vice-presidents, offers a five-dollar gold piece for the best essay on floriculture by a pupil of the Erie Public Schools. Very liberal premiums are offered, both in cash and articles donated by citizens and others, and every preparation is being made for a successful exhibition. Bennett Dobbins, secretary.....

The steamer Holland, arrived on Wednesday with 118 Coach and draft horses belonging to M. W. Dunham of Illinois, besides several for other parties. The vessel has brought over 304 horses for Mr. Dunham this season. The last shipment included 13 first-prize-winners at the Paris Exposition, and six prize-winning Clydesdales from the same show.....The Indiana dressed-beef law has been declared unconstitutional by Judge Irwin of the Marion County Court.....The eighth annual meeting of the American Forestry Congress, and the fourth of the Pennsylvania Forestry Association, convened in Horticultural Hall, Philadelphia, Tuesday evening. H. G. Joly of Quebec in an address, dwelt forcibly on the common interests of Canada and the United States in the preservation of their forests. On Wednesday, B. E. Fernow, Chief of the Forestry Division of the Department of Agriculture, spoke of the limitations under which the Division performed its work. Congress refused to make appropriations, and nothing could be done but to gather and compile statistics. The long-leaved pine is said to be disappearing from the Gulf States. Florida made the encouraging report that the planting of orange groves kept pace with the destruction of the pine forests to the benefit of all interests. A congratulatory report of the successful working of the Arbor Day Law in New York was given. Prof. Fernow favored governmental control of timber land, but confessed that the government was unable to manage its own timber lands, and in the States of California and Colorado its regulations even impeded the local authorities .....

Two more Pennsylvania live-stock insurance companies have been closed up by the courts.....The receipts of cattle at Chicago last week reached the enormous total of 82,356 head.....In the first eight months of 1888, Great Britain imported from this country 105,200 head of cattle; in the corresponding months this year, 182,000, a very heavy increase. The percentage of increase in shipments of sheep was still larger.....

The new country residence of W. Atlee Burpee situated on his Ford Hook Seed Farm near Doylestown, Pa., was destroyed by fire on Thursday afternoon. The family had just vacated it the day before.....

Crops & Markets.

SATURDAY, October 19, 1889.

WELL, my farmer friend, what say you to a walk among the commission merchants this fine morning to see what they have on hand and how the various farm products, over which you have toiled and sweated in storm and sun, are handled at this end of the line? Nearly all of the wholesale business is done in the lower part of the city. Everything arriving from any direction is landed on the wharves, for all freight nearly must come to New York by water. Your car-load of potatoes shipped over the Pennsylvania railroad arrived at Jersey City early this morning; in company with several other cars it was run on a float carrying about 10 cars, and towed to the dock at the foot of Cortland Street. Here the potatoes are unloaded into the freight-house and a truckman who is employed by your consignee to look after all goods arriving for him, immediately delivers them at the latter's store, for which service he receives five cents per barrel. Sometimes such products are sold on the track, but all small lots are taken to the stores. Here we find a motley collection of all sorts of fruits, vegetables, poultry dead and alive, butter, cheese, eggs, honey, hog-dressed calves, hams, maple sugar and sirup, sweet cider, flour, grain, feed, all kinds of game in season, herbs of various kinds, and if there is any product of the earth not found here, you will be puzzled to say what it is. Business has been going on here since about five o'clock this morning; in summer it begins about three. But you may wonder where all this immense accumulation goes to! New York has a population of about 1,500,000, and Brooklyn about half that. There are numerous cities and towns within a radius of 50 miles having populations of 200,000 and under which depend largely upon New York for their supplies. Then there are about 400,000 people coming into and going out of the city daily. Then there are the numerous ocean steamers going from this port to all parts of the world, many of them carrying passengers sufficient for a good-sized country village; these must be supplied with provisions for their long voyages. Add to these the fact that New York is the grand distributing point of the whole country, and the wonder ceases.

POTATOES seem to be very plentiful and the receipts are of good quality. This dealer who handles large quantities says that shipments have been very heavy, especially from the West, and that the demand is very moderate, hence prices are somewhat lower. He thinks it would be well for those having potatoes to ship to wait a while, as prices are not likely to be much better until the present large stock is reduced. You will notice by looking over some of these barrels which have been opened, that the packers made a mistake in not assorting them more carefully. Here is a barrel of fine Roses which would have sold for $1.75 if the packer hadn't been so anxious to put in every potato that would possibly do. Look at them! Scattered all through the barrel are potatoes too small for market, with here and there a scabby one, which gives them such a disreputable look that they must be sold for about $1.25. The small ones all chink in between the larger ones, and do not fill up any; they serve only to reduce the price. This dealer says that sweet potatoes have been scarce during the past few days, and that the price of prime ones has advanced. He says that people who know what good potatoes are, call for the Virginias, as they are considered superior to those grown in New Jersey. We miss the immense quantities of onions which were piled up on every hand last fall, and this odorous ingredient of soups and stews will be somewhat scarce and higher in price. Cabbages and other vegetables you notice are plentiful, and mostly of good quality, though there are some poor lots, which will have to be sold at very low prices.

SOME of the commission merchants make more of a specialty of particular products, and they can usually do better in selling such than when they handle a miscellaneous assortment. Some other day, we will look over some of the dealers in other products. We can only say now that the butter market is weaker and a trifle lower on account of heavy supplies; the egg market ditto; and the poultry market under large receipts, has taken quite a drop. Choice apples are in demand, and grapes have advanced in price.

LATEST WHOLESALE PRICES

OF

COUNTRY PRODUCE.

New York, Saturday, October 19, 1889.

BEANS.—Marrows—New, $2 45@$2 55; New Mediums, choice, $2 15@$2 20; Pea, $2 15@$2 20; Red Kidney, $3 75; White Kidney, choice, $2 60@$2 70; Foreign Mediums, $1 35@$1 55; California Lima, $3 50@$——Italian, $1 85@$2 00. Green Peas, $1 20@$1 25.

Indust'l Societies.

THE DANBURY FAIR.

(RURAL SPECIAL REPORT.)

THE week ending October 12 has proved a very successful one in every way for the Danbury, Connecticut, Fair. The weather was fine and the attendance large. About 18,000 to 20,000 persons were on the grounds Thursday and Friday. The Agricultural exhibits were fine, but they formed a very small portion of the various displays. Some of the best cattle within a radius of 100 miles were brought here on exhibition: these included Jerseys, Holsteins, Devons, Swiss and Short-horns. A. G. Barnes & Sons exhibited their thoroughbred herd of Holsteins from Mountain View Stock Farm, New Milford, Conn. Henry E. Johns as foreman and manager for Mr. Robert Hoes of Spring Farm, Lake Waccabuc, N. Y., exhibited their thoroughbred herd of Jerseys, also granular, ball and print butter, and some horses, including the family, cart, riding and trotting stock. He showed four pairs of thoroughbred Jersey steers and oxen which he claims can do just as much work as any cattle of their weight; they are smart and active.

There was a very good showing of sheep for a fair in this locality. Mr. Nathan Seeley's flock of Shropshire-Downs from his farm in Wilton, were as handsome a lot as can be found in this section. D. H. Van Hoesen of Wilton, exhibited Spanish Merino, Shropshire-Down and Cotswold sheep, also four Angora goats and a fleece. These goats created a great deal of comment as they are something new here. Mr. Van H. has had them with his sheep for the past four years and has had no trouble from dogs; the year before he put them there he had 21 sheep killed by dogs. The horse show was the best the society has ever had; horses were exhibited from all the surrounding counties and also many from New York State. The trotting horses were many and the trotting was good and occupied the attention of thousands every day during the week. The agricultural machine exhibit was not large, but the goods exhibited were of the latest improvements in mowing machines, hay-rakes, harrows, cultivators, plows, lawn-mowers, cutting-machines, hay-carriers, wind-engines, manure-spreaders, hay-presses, wagons, etc.

The improved creamery goods were exhibited of the Cooley, Moseley & Stoddard and Peerless systems. Samples of fertilizers were shown by H. J. Baker and Brother. The Mapes, and Quinnipiac Companies distributed their circulars only. The exhibits inside the tents and buildings consisted of vegetables, fruits, etc. The showing was not large but the quality of all exhibits was fine, including potatoes and all garden vegetables. Apples, pears, quinces, peaches, grapes and canned fruits were well represented. Bread, cakes, pies, etc., were shown by the ladies. Butter and cheese, both home-made and from the factories were exhibited in good shape. The ladies' department was so full of fancy articles that the room allowed them was not large enough; the exhibits brought out some of the finest of needle-work from old and young.

Literary.

MAGAZINE REVIEWS.

IN THE HOME-MAKER for October, Catherine Owen tells about "Cheap and Good Country Living," but the title is misleading, as the nearest the author gets to the country is as far as the suburban towns within reach of New York. People who call living in these towns living in the country, know as much of genuine country life, as the average farmer knows of the manner of life of the millionaire city dweller. Still there are many good suggestions. One is in regard to keeping meats and other perishable articles of food without ice. Cool, pure air, such as is found in a clean, well-aired cellar is the first consideration. A hanging safe, with sides of wire gauze to protect from the festive fly, hung in a draught of air is excellent. "An Inherited Vice" is a well-written story, by Bessie Chandler, of one of those disagreeably clean persons, who are waging a perpetual warfare on dirt, and who make life a burden to their families. Cleanliness was not next to Godliness with her, it *was* Godliness. She said she "wouldn't mind dying so much if only there was something cleaner to be buried in." Her daughter married a fine young man, and came near ruining him by her inherited vice, but a fortunate combination of circumstances happily intervened. A fine illustration and charming description of "Cliff Seat, Ticonderoga," the summer home and birth-place of Joseph Cook, are given by Frances J. Dyer. The original homestead slightly altered forms a part of the magnificent residence, and is occupied by the venerable mother of Mr. Cook. It is a home worthy the renowned owner and his talented wife. A sound, sensible article is "Our Boys' Politics." A mother was bewailing the opening of another saloon as an added temptation to poor men to spend their money and lose their manhood. Her eight-year-old son burst forth with the staggering query: "What do they let them do it for? Ain't there *any Christians in Congress?*" What a commentary on prevalent forms of government in restraining vice, in those few words! There are articles for young people, housewives, mothers; about fashions, window and cottage gardening, etc. Single numbers, 20 cents. The Home-Maker Co., New York.

ONE OF THE BEST journals published for the housekeeper is the Ladies' Home Journal. It is now in its sixth volume and has attained an enormous circulation. For the amount and quality of matter, it is the cheapest paper of its class published in America, if not in the world. The October number contains the opening chapters of "Phillida," a novel by Maud Howe. "Talks with the Doctor" contain sundry suggestions about cleanliness and soaps. A test of good soap is given. "Don't use the nose as a test in buying soap; use the *tongue*. Touch the tip of the tongue to it; if it has a *sharp*, alkaline taste, don't buy it." The "Mothers' Corner" has much to interest the possessors of babies, little and big. Marie Merrick in "The Evils of Spanking" discourages that orthodox method of correction. "The First Weeks of Infancy" is a short but extremely valuable article for those having the care of young infants. The use of drugs and medicines is discouraged. "Contagious Diseases" gives precautions to be used in cases of scarlet fever and diphtheria. A department of fashions gives the latest styles from Paris. There are many short stories, and much other valuable and entertaining matter. Send for a free sample copy. One dollar per year. The Curtis Publishing Company, Philadelphia.

LEND A HAND has a report from the teachers sent by the Massachusetts Indian Association to instruct the Apache prisoners at the Mount Vernon Barracks in Alabama. The Apaches show great aptness in learning and using the English language. The best element of the tribe ask for a school and farms. The just settlement of the Indian question seems to be a perplexing problem. "The Cure of Inebriety" is an extract from a report made by Dr. Day to the Washingtonian Home in Boston. It deals with opium and chloral as well as with alcohol, and gives much information as to their effects upon habitual users. Considerable space is given to reports from Ten Times One Clubs, Kings' Daughters, the Ramabai Association, and kindred organizations. J. Stilman Smith & Co., Boston.

Law.

"Every Man is presumed to know the Law. Nine-tenths of all Litigation arises from Ignorance of Law."

D. D. S., Oswego, N. Y.—A and B's farms adjoin each other. A has plenty of timber for a fence on his land; but he uses barbed-wire for his part of the division fence. B requested him to fasten two lines of poles to the fence to make it less likely that stock would injure themselves against it. A thereon placed poles on top to the posts and says it is now a lawful fence. If B's stock should injure themselves by coming in contact with it, will he have any redress?

ANS.—If the fence is a lawful one, B will have no redress; if it is not, he will have good grounds for action against A for any damage done to his stock by the fence.

Rural Topics.

CAN THE EAST LEARN AGRICULTURE FROM THE WEST.—Perhaps my Eastern experience is too limited: but the matter to me looks very much like this: Both sections of the country have many successful, prosperous farmers, men of intelligence and ability in their profession. The proportion of farmers who are making more than a bare living from their farms seems greater in the West than in the East. There are two apparent reasons for this: one is the fact that the West is a comparatively new country—with land of much greater natural fertility. The East, with land somewhat exhausted and naturally harder to work, is at a disadvantage. Again, the East is almost too conservative. As a rule, the majority of the farmers do not go about the country so much, or compare methods and results. They cling too hard to old ways. The ways of their fathers are considered good enough for them. Innovations are looked upon with distrust. They wait too long to let some one else give everything new a thorough trial—and then they doubt still.

The Western man comes from the same stock; but he has cut loose from the parent stem and "gone West"—evidence No. 1 of thrift and a desire to better his condition. But he finds himself in a big country. Nature has provided a boundless expanse of a country fair to look upon. He wants to do things upon a correspondingly big scale. He buys too much land. He builds too fine buildings. He buys too much machinery. He rushes into every new scheme and finally fails—a victim of too much enterprise. The successful man East or West is a medium between these two.

The "general average" of Western farmers has more skill in the care of stock. He provides better stables. I believe the stables and barns in the dairy sections of Wisconsin, taken as a whole, are excelled nowhere in the country. Here I think the East may learn from the West—to a certain extent. I also think that in many sections of the West the farmers excel those of the East in maintaining the fertility of the soil. The East spends hundreds of thousands of dollars annually for expensive commercial fertilizers. The Western man by a judicious rotation of crops, and by keeping sufficient stock to eat all coarse fodder produced upon his farm, by farming to produce a large amount of coarse feed, then by saving and applying his manure, not only maintains but increases the fertility of his land. Again, with less of an incentive to careful and economical feeding of stock, he gives the matter more attention. As a result, he keeps more stock upon a given quantity of land; hence he has more fertility to return to the land in the shape of manure. Thus at the end of the year he finds his business in a more satisfactory state than does his Eastern co-worker.

A JERSEYMAN'S JOTTINGS.

THE CONGRESS OF AMERICAN NATIONS.

THE rains have been so constant of late that I have had more time than usual for reading. I am considerably interested in the coming meeting of the representatives of the Republics of America and I have read all I could find printed on the subject. My interest in what I may call Spanish America dates back to my boyhood. In my younger days the rush to the California gold diggings carried off four of my brothers and various other relatives. I wanted to go myself, but it seemed better that I should stay at home on the farm, and so I stayed. But those who did go had so many curious tales to tell about the people and practices of the South American countries that I became deeply interested in their history and resources, and it has been a sort of hobby of mine to keep posted regarding their progress. All readers know that they have a special liking for the history of some foreign country or for some period of old history. I have enjoyed reading about the history of Spanish America rather than about that of European countries. So it may be seen why I am deeply interested in this gathering or convention.

Why It Is Called.—It looks to me like a matter of business rather than one of sentiment. We are all "Americans" to be sure, from Alaska to Patagonia. As a matter of fact, the American pedigree of our Spanish-speaking friends is about 100 years longer than ours is. Still, we Yankees and Jerseymen have always assumed that the English-speaking folks are the true Americans. Before we get through with this convention, we shall doubtless look at this matter somewhat differently. The Southern Republics have always regarded the United States with a little suspicion. It is a good thing we can't read Spanish, for some of the articles in South American papers would make us feel like going on the war-path at once. This convention is based on business and not on sentiment. It is a question of trade. These Spanish Republics have sent the wisest and brightest men they have to look over our resources and compare prices so as to see what they can buy here to advantage and also what they can sell. The bulk of their trade at present goes to England and Europe. As a matter of fact, so far as any sentiment goes, they would just as soon trade in Europe as trade with us. It is a matter of dollars and cents, of return business, of cheap transportation and favorable tariffs. The countries south of us have fruits, hard wood, dye-stuffs, cotton, sugar, rubber, minerals, hides, meat and wool to sell. They want to buy manufactured goods, dairy products and breadstuffs.

Do We Want Their Trade? Certainly we want to sell them all we can. We are conducting business in this country for the purpose of selling goods. Give us the chance of supplying, say 75 per cent. of the imported bread-stuffs and dairy products used in South America, and every dairyman and wheat grower, would feel the effect of the new market at once. Give our manufacturers a chance at this trade, and every manufacturing town in the country would brighten up. But this is not to be any one-sided affair. If we sell to these countries, we will have to buy something from them. Other nations do so, we must. Suppose, for example, Brazil says: "We can provide you with all the coffee and sugar you need Buy of us and we will buy our butter, cheese, flour and manufactured goods of you." Then the Argentine Republic says: "Buy our wool, and we will buy our supplies of you." And Mexico, Columbia, Peru and other countries come forward with si nilar propositions. They all want to buy, but they all have something to sell in return. They have traded with European countries for a long time. They don't care to change unless they can "better themselves." But now come the United States wool-grower, sugar-maker, and the official who draws a big salary for "investigating" sorghum or the cotton planter. "You must buy our products first," they say. "We don't care for this foreign trade if it necessitates the purchase of the products we handle at a cheaper rate than we can profitably produce them." Then the agents of foreign countries go to the Spanish Republics and say: "We control the commerce of the world. The United States have not the necessary steamships for transporting their goods." So two of the most important things to come before this convention will be

Transportation and Tariffs.—As for transportation, there is not much to fear about that. A railroad through Mexico that shall connect with the railroad systems of South America, so that a car can run from New York to Buenos Ayres, is a possibility, and steamships can be built and manned by Yankees as well as by French or Germans. But all these vast enterprises will require millions of capital, and that must come from merchants and manufacturers who will not invest it unless they are assured that the tariffs can be so adjusted that the goods they handle will be put through the custom-houses on the most advantageous terms. The custom-houses of the Spanish Republics are something wonderful as regards their ability to mix things up. In many of them the customs authorities receive no salary, but depend upon the fines which they are empowered to impose and of which they receive 50 per cent. A slight clerical error will prove sufficient for one of these officials to impose a fine of 50 per cent. of the value of the article. Before any satisfactory business can be done there must be a system of uniform tariffs and customs regulations to serve for all the countries. When we consider that our present administration was put in power because of its advocacy of a high tariff, and also the immense difference between the volume of trade in this country and that from each of the smaller countries, the difficulties in the way of the convention can be understood. To my mind it is the most wonderful business scheme that the world has ever known. Its possibilities are absolutely beyond ordinary comprehension. If it be rightly managed and wisely developed it will change the history of America.

Other Points.—If we are going to do business with Spanish people we shall have to have people who can talk Spanish. If this Congress is a success we shall come to the times when Spanish will be a more important study in our schools and colleges than French now is. The delegates are now traveling about the country to see what things we have to sell, and how we produce them. We don't hear of their looking at any Eastern farms. Those in charge of the trip seem to think the West is the only agricultural section worth showing them.

JERSEYMAN.

CATALOGUES, ETC., RECEIVED.

NATIONAL SILVER CONVENTION. This convention is called to meet at St. Louis, November 26. The object of the convention may be learned from the following extract from the circular sent out by the chairman:

"We believe that our senators and representatives in Congress should be urged to restore silver to its ancient use as money, by giving it free coinage. This will place it on an equality with gold, and we believe at a par with that metal. Until this is accomplished, it should be earnestly insisted upon that the maximum amount of 4,000,000 dollars' worth of bullion should be coined per month."

"BITTER WEED."—Bulletin No. 9 of the Mississippi Experiment Station. Those who are familiar with agriculture in the Gulf States must have noticed a beautiful, green plant with large, golden-yellow flowers. It creeps everywhere—along roadsides, into pastures and old fields—wherever it can do any damage. From the date of its coming till frost the Southern dairyman is weary of life. The milk, the butter and the beef are all tinged with a bitter taste strongly resembling the characteristic taste of quinine. The common bitter-weed, Helenium tenuifolium, while giving the bitter taste to everything produced from it, is considered harmless so far as its effects upon the system are concerned. In fact, it is considered a good tonic for cattle in the spring, while it promotes digestion in a proportion of human beings. Dr. Phares, who prepared this bulletin, has observed the matter for 46 years. But another plant closely related to this one, viz: H. autumnale, does injure and kill some domestic animals. Experiments conducted at the Mississippi College, show that calves and sheep are injuriously affected by this plant, while horses and mules are driven by its effects to violent efforts. A pint or two of lard poured down the animal's throat always gives prompt relief. Animals seem to have no special fondness for this weed except when they have been deprived of green food for some time and are then driven where the weed is plentiful and other green plants scarce.

Animals, notably sheep, once intoxicated by the plant and recovering, seem to acquire a mania for it, and when finding themselves in localities where it grows hurry to and devour it.

A MONTHLY POULTRY PAPER with the alluring motto: "How to make Money with a Few Hens," has been started by the enterprising firm of I. S. Johnson & Co., Boston. It is edited by A. F. Hunter, and is called the Farm Poultry Monthly. It is well filled with practical poultry matter, drawn quite liberally from various papers. It is intended for the farmer more than for the fancier.

DIGEST OF THE ANNUAL REPORTS OF THE AGRICULTURAL EXPERIMENT STATIONS.—The pamphlet is issued by the Department of Agriculture. It is prepared by Prof. W. O. Atwater and contains a condensation of the reports of the directors of the experiment stations. As the R. N.-Y. has before stated, the law requires the directors to make annual reports giving a synopsis of the work done during the year. The Department of Agriculture at Washington is to condense these synopses. Thus we have, in this volume, an outline of the work done at all the stations during 1888. It is a valuable pamphlet—an excellent index of American agricultural experiments.

MANURES FOR MINNESOTA.—In Bulletin No. 8 from the Minnesota Experiment Station, we find a number of timely articles. In spite of the belief, quite general among a class of Western farmers, that fertilizers and manures are at present unnecessary, the Minnesota Station wisely begins to talk about these substances now. We are given a list of the crops produced in Minnesota with the values of the various fertilizing elements contained in them and the amounts removed by each crop. This makes a startling showing. The Minnesota farmers who begin to study it now will be richly repaid for their study 20 years hence. There is another excellent article on the by-products of wheat. In 1888 the mills of Minneapolis alone produced 7,056,680 barrels of flour, requiring over 30,000,000 bushels of wheat. This of course threw on the market vast quantities of bran, shorts, screenings, weed seeds, etc. The wheat crop of Minnesota yields, in addition to the flour, 200,000 tons of bran, 50,000 tons of shorts and 75,000 tons of "screenings" containing light grains of wheat and many seeds of weeds. Not half of this vast "by-product" is kept in the State—it goes to other sections where the farmers know its value for fertilizers and feed. Strange as it may seem to Eastern farmers, the "screenings" are most sought for by Minnesota farmers. Near the mills these screenings cost $7 per ton, and wideawake farmers are begining to see the great value of this product. Fed whole to horses the "screenings" compare favorably with oats; when crushed they are well liked by dairy cows. Many sheep are now winter-fed near Minneapolis and St. Paul on "screenings" and hay, while hogs and poultry thrive well on this feed. In fact, of all the by-products produced at the flouring mills, the "screenings" seem the most economical food. In fact, we are told that the demand for the "screenings" is so great that it is impossible to supply all that is called for. Many millers grind the screenings and either mix it with shorts or bran or sell it as "flour of screenings." It must be remembered that while all the "screenings" is demanded for near-by feeding, tons of bran and shorts are shipped out of the State. The following table gives the average composition of "screenings" as compared with other substances.

	PROTEIN. *per cent.*	FAT. *per cent.*	CARBO-HYDRATES. *per cent.*
Oats	11.38	4.81	60.05
Screenings	11.67	3.00	65.83
Clover Hay	12.55	2.44	40.55
Bran.....	15.36	4.14	57.59
Shorts.....	13.83	3.83	53.50

THE RURAL NEW-YORKER

A JOURNAL FOR THE SUBURBAN AND COUNTRY HOME

VOL. XLVIII. NO. 2075. NEW YORK, NOVEMBER 2, 1889. PRICE, FIVE CENTS. $2.00 PER YEAR.

Entered According to Act of Congress in the Year 1889, by the Rural New-Yorker, in the Office of the Librarian of Congress, at Washington, D. C.

Field Crops.

Notes from the Rural Grounds.

THE THREE BARRELS POTATO EXPERIMENT.

RESULTS OF THE REGULAR CONTEST PLOT OF THE R. N.-Y.

How Much Fertilizer may Profitably be used for Potatoes on an Impoverished Soil that Needs "Complete" Fertilizer?

SIXTH SEASON'S EXPERIMENTS.

Essentially the Same Results Every Year.

FERTILIZER UNDER AND OVER.

THE THREE BARRELS.

ON April 10, three barrels of the same size were provided with perfect drainage and filled to within 16 inches of the top with garden loam and sand—half and half—thoroughly mixed. While mixing the sand and loam together, Mapes's potato fertilizer was added—one-quarter of a pound to each barrel. In the first barrel a single tuber (medium size) of the R. N.-Y. No. 2 was placed upon the loam and sand, being 16 inches below the top of the barrel. In the second barrel a single tuber of the same size of the R. N.-Y. No. 3 was similarly placed. A single tuber of the R. N.-Y. No. 4 of the same size was placed in the third barrel. These potatoes were then covered with about three inches of the same sand, loam and fertilizer, the distance from the top of the soil being now about 13 inches. As the shoots of the growing potatoes appeared above the surface, more soil and sand were added until the barrels were filled to within an inch and the tops were allowed to grow as they would, being at length supported by a platform raised to the hight of the barrels. The seed was planted April 10 and the shoots of all three appeared above the soil May 18, there being scarcely 10 hours' difference.

Planted 16 inches deep where would the tubers form; near the bottom, near the top, midway, or in tiers from the bottom to the top? This is what the experiment was designed to show. It was also designed to show the root and tuber-forming growth of plants raised under these peculiar conditions. The plants were watered as water was needed. It was unnecessary to apply poison as the potato beetles seemed to prefer a lower plane. In the earlier part of the season the leaves showed no Flea-beetle perforations and few were seen upon them. Later they injured the leaves as much as those growing in the regular "Contest" plot near by. This is noted because it has been stated that the Cucumber Flea-beetle confines itself to within a foot or so of the ground.

It was the design to have sawed the barrels lengthwise in halves and to have removed the soil and sand just as the vines began to show maturity, but while yet the potatoes would cling to the stems. Thus the root and tuber-bearing systems could have been well shown after the sand and soil had been carefully washed out by the use of a hand pump and hose. The vines "blighted," however, in mid-July and were quite dry and dead before the services of a photographer could be secured.

The cut shows fairly well in what part of the barrels the tubers grew, apparently from four to 12 inches below the surface, yet while washing out the sand and soil, several fell from their places. The reader must bear in mind that back of those shown in the photograph other potatoes were covered and concealed by the sand and soil. The yield was as follows: R. N.-Y. No. 2 yielded 13 marketable potatoes, eight small and two rotten, weighing six pounds. The decayed tubers were not weighed or taken in the account. Allowing three square feet to the hill as in field culture, the yield would be 1,452 bushels to the acre.

The No. 3 blighted earlier than the others and the yield was 20 very small potatoes, weighing 14 ounces.

The No. 4 yielded 13 marketable and three small tubers. Not less than 10 were rotten and not estimated. They weighed 4⅓ pounds.

THE REGULAR CONTEST PLOT OF THE R. N.-Y.

OUR older readers will not be interested in the details of this renewed effort to raise at the rate of 700 bushels of potatoes per acre on one-fortieth of an acre. But the details should all the same be furnished to the many new subscribers of this year who know little or nothing about it. Not only was the attempt made on one-fortieth of an acre, but upon two measured acres as well, the one located on high, sandy land, the other upon low, moist, loamy land, so that, let the season be wet or dry, there would be one acre adapted to the weather. Both are comparative failures owing to blight. The R. N.-Y. No. 2 was the variety planted on the low-land acre; Brownell's Winner on the high, light land. Particulars of the yields will be given later.

THE CONTEST PLOT.

The trenches were dug April 6, 10 inches deep and wide, 11 in number, each 33 feet long and three feet apart. Twenty-five pounds of Mapes's potato fertilizer (1,000 pounds to the acre) were then sown broadcast, walking through the trenches—not *in* the trenches alone, but over the soil piled up between the trenches as well. The bottom of each trench was then loosened with a Hexamer pronged hoe. Five inches of soil were then raked back into the trenches and on this the seed-pieces (half of medium-sized potatoes with the seed end cut off) were placed exactly one foot apart, making 33 in each trench or 363 in the entire plot. Such large seed pieces were never used before. The trenches were never before dug quite so deep and never before placed upon so great a depth of *mellow* soil. This work was done in a perfect manner as the weather was fine and the soil in splendid condition to work. The trenches were then filled, being careful to fill one at a time and complete it so that the work could be done without walking on the completed trenches. Never was there a mellower seed-bed.

NOTES OF PROGRESS.

May 7. To-day Flea-beetles were noticed in great numbers. Some of the plants were four inches high, others just breaking through. Sprayed all with tobacco soap dissolved in water, using two ounces to a pailful of water. Not effective.

May 8. Sprayed the plants with water in which tobacco stems had been boiled; also with whale-oil soap water, one ounce to one gallon of water.

May 9. Used Thymo-cresol and Paris-green and water. Corn-cobs were dipped into crude carbolic acid and one placed between every two plants. Not effective in the least.

May 10. A cyclone attended with heavy rain. In the evening after the storm as many Flea-beetles were noticed as before the storm.

May 12. One table-spoonful of hellebore, one heaping table-spoonful of buhach, 25 drops of sulphuric acid, one tea-spoonful of Paris-green to a pailful of water were sprayed on the vines. No effect.

May 14. Two tea-spoonfuls of Thymo-cresola

PHOTOGRAPH OF THE R. N.-Y'S BARREL EXPERIMENTS. Fig. 264.

a heaping tea-spoonful of Paris-green to a pailful of water sprayed on the plants.

The leaves now began to show some injury from these applications.

May 17. Fleas thicker than ever. Applied Bordeaux Mixture on half the plot, and on the other aloes dissolved in hot water, four ounces to two gallons. The fleas seemed delighted with both.

May 22. It was plainly seen that the R. N.-Y. No. 3 plants (second trench) were dying. It was decided to dig them up and plant Minister instead. A few days after several rows were dusted with unleached wood ashes. The fleas the next day were not so numerous upon the dusted plants. They preferred the plants not dusted. Later the plants of the entire plot were first sprayed with water (being dry) and then a mixture of the following was sifted upon them: Paris-green, two pounds extended with one barrel of plaster; sifted unleached ashes; one-eighth pound of snuff, making in all a quarter of a barrel in the proportion of two-thirds ashes and one-third poisoned plaster. This was found to repel the fleas somewhat.

June 16. Excessive rains up to this time. The vines have made a fine growth.

July 23. Excessive rains up to this time. Soil saturated. Every variety is more or less injured by the Flea-beetle.

July 30. Vines dying.

THE KINDS PLANTED.

" "	10	Seedling of Rose from Thos. Lazell, Big Rapids, Mich., 22	"
Trench No.	10	Tonhosks from Theron E. Platt, Newtown, Conn. 11	"
Trench No	11	Brownell's Winner, 33	"

THE YIELD.

No. 2 yielded 63 pounds or at the rate of 454.66 bushels to the acre. They seemed to be about half grown. There were few rotten potatoes.

MINISTER yielded 32 pounds or at the rate of 234.66 bushels to the acre. Many small many rotten.

No. 4 (third row) yielded 53 pounds or at the rate of 388.66 bushels to the acre. Many rotten; half grown.

No. 4 (fourth row) yielded the same as the preceding—53 pounds.

No. 4 (fifth row) yielded the same within a fraction.

BROWNELL'S WINNER (seventh row) yielded 38 pounds or at the rate of 278.66 bushels per acre. Many rotten, all small.

MONROE COUNTY PRIZE yielded 63 pounds or at the rate of 462 bushels to the acre. Many rotten.

WOODBURN SEEDLING yielded five pounds. There were 11 hills. This is at the rate of 110 bushels per acre.

NEW QUEEN, 22 pieces yielded 48 pounds or at the rate of 469.33 bushels to the acre. The tubers were small but there were a great number.

SEEDLING ROSE yielded 71 pounds or at the rate of 520.66 bushels to the acre.

BROWNELL'S WINNER (duplicate row) yielded 71 pounds or at the rate of 520.66 bushels to the acre. This last row was planted with seed from Mr. Brownell while the other row was planted with seed raised here last year.

THE ENTIRE YIELD

was 549 pounds, without making any allowance for decayed tubers, which is at the rate of 367 bushels to the acre. Taking the whole lot, probably over one-fourth were rotten, while the sound potatoes were not over one-half the usual size.

To what extent the premature death of the vines was due to fleas, to excessive rain or to fungoid causes, we are unable to form any opinion.

HOW MUCH FERTILIZER MAY BE PROFITABLY USED FOR POTATOES ON AN IMPOVERISHED SOIL THAT NEEDS "COMPLETE" FERTILIZER?

THE soil on which these experiments have been carried on for the past *two* years is so impoverished that the yield by the most careful trench culture without fertilizer is less than 150 bushels of potatoes to the acre, while paying crops of corn or vegetables of any kind are out of the question. Fertilizer (Mapes's potato) has been used from 440 to 2,200 pounds to the acre for two seasons on this particular plot and for four seasons on two other fields and the results have been essentially the same, whether the weather has been wet or dry. The variety was the Rural Blush. The season the wettest ever known.

1,760 " "	294
2,200 " "	336

Rot prevailed more than ever before. The rotten potatoes were not estimated. The vines were injured by the Flea-beetle and died nearly one month earlier than usual. The tubers seemed to be about three-quarters of the normal size.

It seems to the R. N.-Y. that farmers cultivating impoverished land should learn a valuable lesson from these experiments which have been conducted long enough to prove that there is a reasonable chance of raising profitable crops of potatoes by the liberal use of high-grade fertilizers. The guaranteed analysis of the fertilizer used is as follows:

Ammonia	4½ to 5 per cent.
Phosphoric acid	8 to 10 " "
Potash	6 to 8 " "

UNDER AND OVER EXPERIMENTS CONDUCTED FOR THE THIRD YEAR.

RESULTS show thus far that in a wet season the fertilizer should be strewn over the seed; in a dry season under.

The trenches were dug the same depth, viz. six inches. In the "fertilizer *under*" trials the fertilizer was strewn in the bottom of the trenches and the seed-pieces (Blush) placed on or in contact with the fertilizer. In the "fertilizer *over*" trials the pieces were placed in the bottom of the trenches and the trenches filled to within one inch. The fertilizer (the same as that used in the experiments recorded above) was then strewn on this soil in the trenches at the rate of 1,320 pounds to the acre, and the remaining inch of the trench filled in and the soil leveled. Fractions are omitted in the result.

AVERAGE.

UNDER.....235 bushels per acre
OVER.....268 " " "

We shall next present the results of having planted potatoes all the way from two to 10 inches in depth. This experiment has been carried on for three seasons.

FIRST REPORTS OF POTATOES TRIED THE PAST SEASON.

SIXTY-FOUR different kinds of potatoes have been raised here, in very small quantities (as usual), during the past season. The R. N.-Y. trench system, so often explained, was the method employed. The Mapes potato fertilizer is the only "complete" fertilizer that has been used on this plot during the 12 years that these trials have been carried on. A less quantity was used than in preceding years—viz., 1,000 pounds to the acre. The soil, it was thought, was rich enough. As high as 2,000 pounds to the acre have been used on this plot, while lime, kainit, bone, ashes, hen manure and horse manure have been freely added as it was deemed advisable so to do. A better preparation of the soil was never made. The early season was precisely as one who was striving for a premium crop might desire. They were planted April 9. It should be repeated that the vines of all the kinds planted died prematurely—whether from the injury they sustained from the Flea-beetle or from "blight," or from the unprecedentedly wet season, is not known to the writer.

MRS. FORAKER POTATO. FROM NATURE FIG. 265.

MRS. FORAKER. This variety was received from M. Crawford, Cuyahoga Falls, Ohio. The seed potatoes were in a perfect state of preservation. The yield was at the rate of 393.25 bushels to the acre. The yield of large and small potatoes was as eight of the former to 20 of the latter. Skin, white; shape elliptical, flattened. The eyes were few and those neither deep nor prominent. It is a beautiful potato. The illustration shows the average, characteristic size and shape.

GOV. FORAKER, from Mr. Crawford. The yield was at the rate of 393.25 bushels to the acre. But two pieces were planted yielding 3¼ pounds. Nearly white skin, long, cylindrical, slightly flattened. Eyes few but rather more prominent than those of the other. There were seven large and 11 small. A shapely, promising potato.

BADGER STATE from J. C. Vaughan, Chicago, Ill. The yield was at the rate of 403.33 bushels to the acre. Three pieces were planted yielding five pounds—13 fair size, 19 small. Nearly white skin; rather long, often cylindrical, often small at one end. Eyes medium. It is not a shapely potato.

SUNLIT STAR, from same. Three pieces. Yield seven pounds, or at the rate of 564.66 bushels per acre—22 fair size, 25 small. Oblong-cylindrical, a little flattened sometimes. Eyes medium, not deep. None large. Purplish-buff color.

WIDE AWAKE from Iowa Seed Co., 809 Walnut Street, Des Moines. Three pieces. Yield 584.83 bushels to the acre or 7¼ pounds for the three hills—24 fair size, 50 small. Long; cylindrical, nearly white. Few eyes, no rot.

EARLY THOROUGHBRED from T. C. Davenport, 124 Dock Street, Philadelphia. Four pieces yielded nine pounds or at the rate of 544.50 bushels to the acre—26 large, 36 small, six rotten not estimated. This would have been a heavy yield in a favorable season. Pink-buff color; shape variable. Eyes rather prominent.

BEAUTY OF HEBRON from P. E. Island sent by T. C. Davenport. Three hills yielded 11½ pounds, or at the rate of 927.66 bushels to the acre—31 large, 20 small. Rather longer than B. of H. as previously grown.

BEAUTY OF BEAUTIES from A. Rose, Penn Yan, N. Y. Tried for the third year; five pieces. Yield 7¼ pounds or at the rate of 350.90 bushels to the acre. They seemed to be about half grown. Shape oblong-flattened, often wedge-shape, some roundish like the Peachblow. Buff skin russeted. Eyes medium—20 large, 15 small.

This is the potato which this man advertised as the same as the R. N.-Y. No. 2. There is little doubt that the sale of a large quantity was secured in this way. He contradicted his own statement not until the season was so far advanced that the bulk of sales had been made. The R. N.-Y. No. 2. is so distinct in vine and tuber that it need never be mistaken for any other variety.

A YIELD OF 700 OUNCES!

THE Rural No. 2 Potato received weighed one ounce. I sprouted it and got seven sprouts and lost one of them by rotting. I planted the six out in the garden about the middle of May. About the middle of June I made 30 cuttings from the tops of the vines and rooted them and put them out about July 10, in the garden beside the first ones. I dug them on the 29th of last month, and from the six original hills I got 19 pounds; from the 30 hills of cuttings I got 24¾ pounds, making a total weight of 43¾ pounds from the one ounce of seed. One of the tubers weighed 18 ounces, one 17 ounces and two weighed 16 ounces each, and as one can judge from the photograph the average was very large. Among the product of the cuttings there were no small potatoes; they ran from one to three large ones to a hill.

I send a photograph of the entire crop that a better judgment may be formed of the average size of the tubers. I think from the reports the R. N.-Y. is publishing that the potato will be largely planted next spring. Potatoes are over an average crop here and I have not heard of any rot in the county. They are selling at 25 cents per bushel. N. B. D.

Marshall, Ill.

[R. N.-Y. Accompanying this report is a statement from the editor of the county paper who, in company with other reliable witnesses, saw the potatoes dug. The editor concludes his remarks as follows:

"This may sound like a fish story, but, nevertheless, it is true in every particular. If there were not witnesses to bear us out in it we would not publish it."

An excellent engraving of a photograph of the yield from this little potato is shown at Figure 266.

I cut my Rural No. 2 Potato, which was very small, into six pieces, planted them in six hills three feet apart without any fertilizers or extra cultivation. I raised 40 merchantable, fine-shaped tubers free from scab weighing 16 pounds, the largest being 24 ounces. Eight of the largest averaged 16 ounces each. Of other varieties planted the Empire State was the best. From a barrel planted the largest did not exceed 16 ounces. The Pearl of Savoy did fairly well. Early Thorburns were almost a failure, being small and scabby. I experimented with sulphur for the scab but found no benefit. From reading the R. N.-Y. last winter, I was induced to try some Japanese Buckwheat. I find that it is the best kind for this climate. Common or old varieties do not fill well and generally blight, as we have very little cloudy weather during the buckwheat season. I cut my first crop of clover the first of June to avoid the midge, but it failed to seed. C. W. M.

St. Charles, Minn.

Rural Topics.

ROT IN POTATO "SEED."

Discussion of a "Discussion."

SAFE TO USE "SEED" FROM ROT-INFECTED FIELDS?

PRACTICAL FARMERS SAY YES.

SCIENTIFIC MEN DOUBT IT.

Study the Facts before you Pay an Extra Price for "Seed" from Districts where "Rot has not Prevailed This Year."

ON page 643, the R. N.-Y. printed a note from "D. C. L., Cranbury, N. J.," concerning the practice of planting seed from potato fields in which a portion of the crop had rotted. As our readers know, several professors at our experiment stations have brought forward the statement that the "germs" or spores of the disease known as potato rot remain in the tubers alive and ready to develop and spread all through the plant if at any time during the growing season the conditions of atmosphere and temperature are right for their development. Hence these professors go on to say that it is not entirely safe to plant potatoes from fields where there has been any serious damage from rot. "D. C. L." combatted this theory, giving an experience of his own to show that the character of the seed had little or nothing to do with the rot; that it was due almost entirely to the weather and the condition of the soil. This is a matter of great importance this year when we consider the condition of the potato crop of this season. There are certain sections where there has been absolutely no rot to speak of. If our scientific friends are right, the seed potatoes from these regions are worth more than those grown on soil where rot has prevailed. Before our readers pay an extra price for such seed, we want them to obtain all the facts. The following notes have been written with "D. C. L.'s" note as a text:

FROM PETER HENDERSON.

Although I have had little experience with potatoes, I reason from a general knowledge of horticulture that there is likely to be no danger in using for "seed" potatoes that have been grown in the vicinity of fields where the rot has been, or even if the seed itself is partially affected. The "rot" as I understand it, is in almost every instance due to a condition of excessive moisture. The "working roots" of the plant die from that cause, the leaves begin to spot owing to injury by a parasitical fungus, which, however, is a *consequence* and not the *cause* of the disease. Tubers from potatoes so affected would not, in my opinion, be any more likely to rot than others, unless the conditions favorable to the disease were present.

This "spotting" of the foliage, variously called "rust," "blight" and "black spot," no matter whether on a potato, a celery or a rose plant, is in every instance which I have ever investigated, brought about by the destruction of the working roots, mostly from excess of moisture, but occasionally from its opposite—excessive drought. The destruction of the roots shocks the vitality of the plants, and the ever-present spores of the fungous parasite pounce on the diseased subject. We have reason to believe that these spores are more or less always present, but if there is no shocked plant, no weakened subject, there is no suitable "soil" for their germination. There is no reason to apprehend that even if these spores remain in the potato "seed," the crop will be injured more than if they were not present. This, of course, is only theory. I have had no actual experience on the subject; but the statement of "D. C. L." seems to confirm this theory in his practice. Potato rot the past season has been so universal that it is safe to say that a large proportion of the "seed" that will be planted, may hold the germs of the disease, but if the weather next year be unfavorable to their development, it is reasonable to hope that no bad results will follow. Were it otherwise, the disease would so spread that the potato crop might be annihilated.

Jersey City, N. J.

FROM EDWIN TAYLOR.

I am not sure that I have ever had experience with potato "rot." To be sure, my potatoes have rotted, more or less, in low places every year when water stood over the ground for any length of time, particularly in very hot weather. Sometimes all have rotted in such places; sometimes a portion only. Those that came through at all seemed to be all right and have been stored and planted along with the remainder of the crop without the rot showing itself in the bin or in the next year's crop, except in low spots again. Sometimes, in our climate, shallow-planted potatoes "cook" in the ground and rot, if the season is very hot and dry. Sometimes, again, potatoes of the Early Rose type will partially rot—half the tuber perhaps will do so; but such potatoes will generally dry up and the sound end will keep through till spring. They are often planted; but I never heard it suggested that they propagated the disease.

Edwardsville, Kansas.

FROM HENRY IVES.

Many farmers are already considering to what extent the prevalence of blight and rot in the present potato crop will affect the quality and value of the tubers for seed next year, and I think it very commendable in them to exercise this care and forethought; and I feel quite confident that it will prove good policy for planters whose crops were more or less affected with blight and, perhaps, rot to obtain their seed for another year from some good potato-growing locality (be it far or near-by) where the crops were not thus affected. There are several good reasons for this, and especially the two following:

Let me first say that I make this suggestion, not through the fear which some seem to entertain that "seed" from infected fields would necessarily perpetuate the rot. This is not to be feared any more than that one will be poisoned by eating potatoes from a crop on which Paris-green had been used. My reason for urging the practice is the very practical one that the tubers, the tops of which were killed by the prevailing blight, necessarily stopped growing then, and being only half grown at the time, they were immature and not fully developed; and all concede that tubers in this condition are poor for seed purposes. Moreover, besides this seeming necessity for making such a change of seed at the present time, such a change almost always proves beneficial for the purpose of crop improvement in any season. For this latter reason I have at intervals, for three different seasons, obtained my seed potatoes from the eastern part of Maine for planting in Western New York, and always with good results. I have also noted, in some cases of almost total failure of the crop either from the rot or on account of a drought, when seed had to be obtained from other localities more or less remote, that often in less than two years many farmers in those sections would say that they had been the gainers, in the long run, by such failures for one season; and the extraordinary commercial facilities of the present day will soon afford any region where failure has occurred a supply from other sections where there has been an abundance of well-matured tubers, so that by judicious selection, at ordinary prices, most planters may secure such a change of seed as may prove of much advantage to them.

Genesee County, N. Y.

FROM G. W. P. JERRARD.

I can give no information from my own experience, on the subject of potato rot as affecting the tubers for seed purposes the following year. We have never been so unfortunate as to have received a visit from that dreaded disease in this part of Maine.

Caribou, Me.

FROM C. H. EVERETT.

I do not believe that the germ of the potatoto rot can remain in the tuber for a considerable length of time without causing it to decay. If the potatoes remain sound from the time they are dug until planting time I should consider them perfectly safe for seed. The rot with us this year is what we call a "wet rot." The tubers that have not rotted are very bright; those that have been affected are all gone. I should not, however, want to purchase seed where dry rot prevailed; for with this disease one cannot tell which tuber will be affected next. I expect to plant next year seed from fields that are affected with rot this year, and as an experiment I shall plant some that are partly decayed, and report the result to the R. N.-Y. next fall. I do not expect that I shall be able to tell the tubers from such seed from those from the soundest seed except by marking the plots.

Steuben County, N. Y.

FROM D. B. HARRINGTON.

The point raised by D. C. L., will undoubtedly figure conspicuously during the coming season for planting, many seedsmen claiming superiority for their seed, on the ground that it was grown in regions where there was no rot this year. My experience extending over nearly a quarter of a century induces the belief that it makes but little difference how badly the rot prevailed among the crop from which the seed came, if the tubers are sound and well preserved at planting time. If the fungus had attached itself to the tuber, and been transferred to the cellar, rot would commence at once in the bin, and continue while any of the live spores remained. But suppose we should plant a tuber to which the fungus is attached? The office of the latter is to produce decay, and consequently it would only accelerate that condition that is absolutely necessary to give life to the plant and enable it to reproduce itself. Have the R. N.-Y.'s learned correspondents ever examined the remains of a decayed seed potato? It is a simple experiment and will go a long way in determining the question. If the fungus should be found in the old potato, then we have conclusive proof that it does not affect the growing crop. If the disease could be transmitted from one crop to another, our potato industry would have disappeared long ago, for there are few farmers who have not planted seed grown in infected districts.

My opinion is that the rot is caused by the formation of poison spores, or fungi, by the action of the elements on cold, sour, improperly drained soil. These spores are of the nature of the deadly yeast plant, and as fast as they mature, detach themselves from the ground, and float in the air to the nearest substance. Having attached themselves to the vine, the deadly work begins. The first symptoms may be detected by the scorched appearance of the leaves at the edge and points. Sores develop on the stalks, the tubers cease to grow, and the vines die prematurely. Rain and heavy dews wash the spores down to the roots and tubers, and rot commences. The fault is not in the seed, but in the atmosphere and soil. I will guarantee to grow a good crop, free from rot, on our Wisconsin prairie, or sandy plains, from seed grown in the most affected fields in the State of New York. It would be money in my pockets to take the other side of the question, as there is no rot here. For the good of the potato industry, I hope this discussion may settle the question satisfactorily.

Walworth County, Wis.

FROM T. H. HOSKINS.

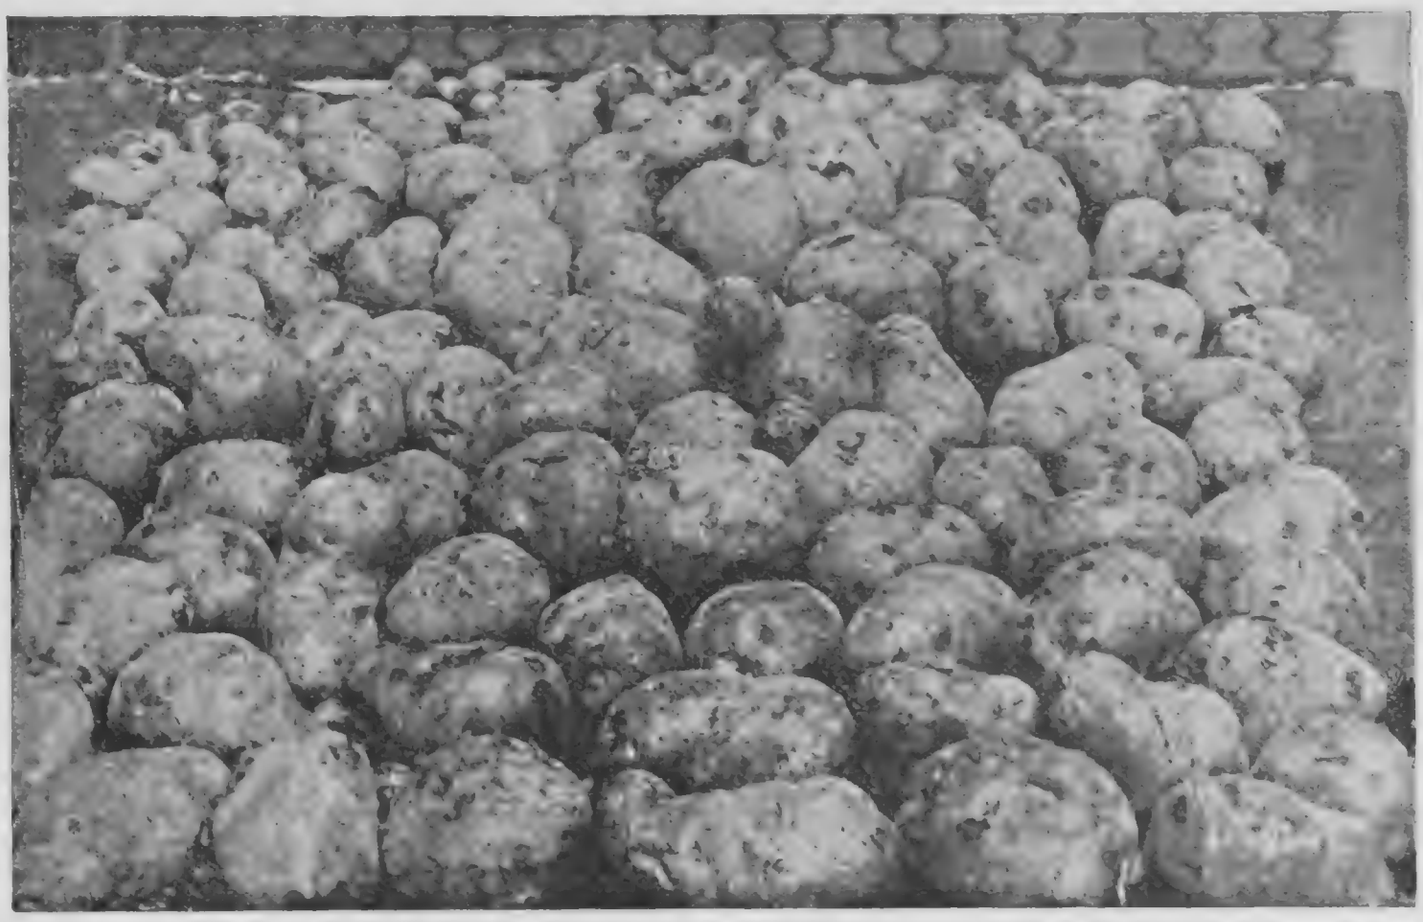
In reply to the RURAL'S request, I will relate my own experience. Last fall I pitted my seed potatoes, and when the pit was opened and the potatoes were taken out, about two bushels of more or less rotten tubers were thrown aside on the ground. A female member of my family, who is fond of making experiments, noticing that the sound portions of these rejected tubers were sprouting, planted a row of them in her garden just as they were, that is, without separating the sound from the decayed parts. This was a number of days before I planted any of the sound potatoes; and from this planting of semi-rotten seed a fine growth was made, and our earliest table potatoes were afterward dug from them. As there were no "skips," it seemed evident that the disease made no progress in the tubers after planting, or at least not enough to affect the vitality and vigor of the stems coming from the sound eyes. A farm hand gathered up the remainder of the lot, and dumped them around some half-dozen newly set apple trees, which soon after received a rather heavy mulching with straw. Shoots from these made their way through the mulch, grew vigorously, and bloomed; but as they were then quickly destroyed by the bugs, no search was made for a crop in those places.

There has never been a year in the past 20 in which I have not found more or less decayed tubers among my seed potatoes in the spring; but there has never been anything observed to show that the disease had extended from an unsound to a sound potato in contact with it. This refers to the common dry rot, and not to the wet rot, where the whole mass of tubers seems to deliquesce, indicatingth at the disease is communicable from tuber to tuber. This form of rot I have seen but little of for many years. It seems to follow that if the disease is not even communicated to plants that spring from sound eyes in a partly decayed tuber, still less will it spread to other tubers; and far less could it be expected to extend to a crop which is sound, from another crop, attacked with decay consequent upon a local cause.

Newport, Vt.

FROM PROF. W. A. BUCKHOUT.

I am obliged to say that we have never made any experiments in this direction,



THE PRODUCT OF A R. N.-Y. No. 2 POTATO WEIGHING ONE OUNCE. FIG. 266.

We are paying attention to the rot this year, but have never tested seed in the way indicated by D. C. L. Theoretically seed from an uninfected region should be greatly superior to that from one known to have been seriously affected by rot the previous year. The suggestion made in the Bulletin of the Tennessee Experiment Station, Vol. II, No. 2, page 36, indicates a promising line of experiment—namely: that heat less than that required to destroy the growing power will kill the spores and mycelium in infected tubers and perhaps copper sulphate will have the same effect. This bulletin is the best contribution to the subject which we have had this year. The rot has prevailed so widely that it is doubtful whether absolutely sound seed can be found.

Pennsylvania Experiment Station.

FROM O. H. ALEXANDER.

My experience shows that it is not a good plan for our farmers to select seed potatoes from a section where rot has prevailed. I dislike to plant any seed that is affected, as I am inclined to think, from what I have observed, that it invites disease to the vines and the new tubers; but one may plant good, healthy potatoes on flat, low lands, and should there be such a rainy season as we have had this year, they will be liable to decay, but not on rolling land. The disease we know as potato-rot may be induced by many predisposing causes, such as feebleness of constitution of the variety planted, rendering the crop an easy prey to the disease; and planting on low, moist land or on land highly enriched by nitrogenous manures, causing a morbid growth which invites disease. But by far the most widespread and most common cause of the disease is sudden changes of atmospheric temperature, particularly when accompanied by rains.

Charlotte, Vt.

FROM PROF. E. S. GOFF.

Unless we disregard the teachings of science and of experiments upon this subject, we can hardly escape the conclusion that seed tubers taken from a crop that was largely affected with the potato rot due to the fungous parasite Peronospora infestans, would be more likely to be followed by an early development of the disease than seed tubers from a healthy crop.

The experiments of Mr. J. L. Jansen of Denmark, as reported in the Gardeners' Chronicle (Vol. 21. new series, p. 208), showed not only that diseased tubers produced less vigorous plants than healthy ones, but that plants grown from diseased tubers developed the disease earlier than those from sound ones. Mr. C. B. Plowwright, of England, who is very high authority upon this subject, has made the statement (Ib. p. 448), that "one diseased set planted in a field is a powerful agent for evil in that field before the general outbreak occurs," and Mr. Jansen, of Denmark, also a high authority, has stated (Ib. p. 589) that "the disease will spread with far greater rapidity from 40 or 50 evenly distributed centers than when it originates from only one place on each acre."

The subject is of less importance in this country than in England, as it is comparatively seldom that the disease prevails here to any great extent, but I should regard it as quite unwise to plant seed tubers from a diseased crop when seed from a healthy crop was readily attainable.

Experiment Station, Madison, Wis.

FROM J. C. VAUGHAN.

My experience in regard to potatoes grown from seed produced in sections where rot has prevailed extensively, is very limited, as for several years our entire stock of the standard newer varieties has been grown in the extreme northern part of Michigan on the Lake Shore, and we have never had a potato rot from the disease yet.

Chicago, Ill.

FROM PROF. L. H. BAILEY.

It is certainly unsafe to plant potatoes which contain spores of the rot, but I cannot say that tubers from a region where rot has prevailed are unsafe, from the fact that one field may be attacked and an adjoining one may not. I can simply advise, as the safe method, to secure "seed" from regions where the rot has not prevailed during the previous year.

Cornell University, Ithaca, N. Y.

FROM FRED. GRUNDY.

Three times in the past 18 years I have lost nearly my entire crop of potatoes by rot. Each time the rotting was caused by excessive and long-continued rains. By storing what sound tubers I could gather in a cool, dry place and in small lots I always managed to save enough for seed in the following year, and the seed thus saved invariably grew as strongly and produced potatoes fully as fine as did seed imported from other States by my neighbors. It may be true that the spores or germs of the potato rot remain in such tubers as are *slightly affected* for some time; but that they are to be found in the clean, sound tubers found among those affected, or that they will develop in such tubers when kept under conditions unfavorable to their development, I doubt mightily. I am perfectly well satisfied, however, that the soundest potato in the world will develop the disease if kept for some time under the conditions which favor its development. That some potatoes which were grown in a rot-infected district will not grow as well and produce as good tubers as those imported from other localities is all twaddle. All that is needed is that they be stored in a cool, dry place and then planted in suitable soil.

Christian County, Ill.

FROM R. BRODIE.

Here is my experience concerning a five-acre field of potatoes, one-half of which was planted with Beauty of Hebron; the other half with Early Rose. The soil was a clay loam with a sandy sub-soil; the seed was from a gravelly field the crop in which had partly rotted last year. Six rows of Crown Jewel Potatoes from Philadelphia were planted in the middle of the field, and all were manured alike. The result was that I obtained a-quarter of a crop of Early Rose and Beauty of Hebron, while I had two-thirds of a crop of Crown Jewel. The latter variety made a more vigorous growth and withstood the blight much longer than the other kinds It seems as if the Early Rose and Beauty of Hebron are losing their vigor and getting "run out," and that we ought to plant the newer varieties that can withstand the blight; for so long as we have a vigorous, green top, we are sure to have sound potatoes at the root. On the other hand, I had seven acres on a gravelly hill, planted with the same seed—Rose and Hebron—and here there was a fair crop of good, sound potatoes. One of our best farmers told me that he had procured seed potatoes from two different sections where there was no rot, and that the product rotted worse than that from the seed he had himself saved. Some farmers are buying potatoes by the car-load for next year's seed.

One of my neighbors had 15 acres of potatoes manured in the hill, the sets being placed right on the manure. They rotted so badly that he obtained only 100 bushels altogether. Mine rotted badly also, but still they averaged 100 bushels to the acre. I plowed under about 25 loads of rotten manure to the acre—part in the fall and part in the spring—worked the land thoroughly with the Acme and Scotch Harrows, then planted the potatoes with the Aspinwall Planter, applying about 300 pounds of potato fertilizer to the acre. With the use of commercial fertilizers potatoes have a bright, clean appearance, and are better shaped than when no fertilizer is used. It is my opinion that potatoes will not rot any more with barn-yard manure well mixed with the soil than they will without it. I had a small field planted with potatoes; on half of it barn-yard manure was applied; the other half I thought rich enough to produce a crop without manure, but was mistaken. The tops were more vigorous where manure was applied. When the blight came the small tops on the unmanured part disappeared the fastest. On the manured part the potatoes were larger, while on the other they were small and not marketable. No commercial fertilizer was used in this field.

Montreal, Canada.

Everywhere.

RURAL POTATO REPORTS.

THE following notes have been condensed from the many letters we have received from subscribers who planted the potatoes sent out last spring:

CANADA.

EIGHT EYES.—Fourteen inches apart in trench. Planted May 27, dug October 3, clay land; stable manure used, yield 20 pounds—all good size but one. W. E. T.
Beaverton, Ont.

FIVE EYES.—Planted May 25, dug September 19. Yield, 36 tubers weighing 14 pounds three ounces. C. E. M.
Spring Hill, N. B.

SIX EYES.—Dug September 11, yield 35 tubers, weighing 23 pounds. Last of six varieties to succumb to the blight.
Highland Creek, Ont. B. F. C.

FOUR EYES.—Started in a flower po. Trench system, rich soil. Yield, 18 tubers weighing four pounds. T.S.
Pelee Island, Ont.

FIVE EYES.—Trench system. Yield 31 pounds. J. J. A.
Thesalon, Ont.

EIGHT EYES.—Fifteen inches apart in trench. A little barnyard manure. Dug September 18. Yield 53 tubers, weighing 29¼ pounds. Finest lot of potatoes I ever dug. A. W.
Castleton, Ont.

CALIFORNIA.

PLANTED five pieces April 30, dug August 12; yield 14 pounds of fine potatoes remarkable for number of merchantable tubers.
Sebastopol. A. E. S.

SEVEN small one-eye pieces were planted April 10. The largest vines I ever saw for such small seed-pieces. Dug September 30. Yield eight pounds. I will give it another trial next year, as it always takes seed one year to become acclimated.
Alturas. L. J. K.

COLORADO.

WE had nine hills from a potato the size of a small hen's egg. They were planted May 3, and frozen down by our June frost. Killed by frost September 5; not ripe. Yield 53 tubers weighing 15 pounds. Not many small ones. MRS. C. H.
Aspen.

CONNECTICUT.

FIVE hills, trench system, blighted and rotted, yield two pounds 14 ounces.
Uncasville. D. A. S.

DAKOTA.

MY small tuber was cut in eight pieces and planted in hills May 15; dug September 10. Yield 65 potatoes, weighing 15¾ pounds. Considering the very dry summer, I consider the yield a remarkable one.
Glover. E. F. S.

ILLINOIS.

PLANTED three two-eye pieces April 22. Yield 7½ pounds. W. B.
Beverly.

PLANTED two potatoes. Yield 20 pounds. Healthiest variety I had. Less blight than others. G. D.
Bunker Hill.

SEED potato weighed 2½ ounces. Planted on prairie sod never before plowed. Yield 5½ pounds. I. M. L.
Alden.

PLANTED eight eyes in deep trenches. Sod in bottom then seed-pieces lightly covered with dirt and then hen manure and ashes. Yield 22½ pounds. I. B. C.
Prospect Park.

PLANTED my potato whole. Yield 4½ pounds. J. E. T.
Yorktown.

I CUT my potato to eight eyes. Planted in hills three feet apart, two pieces in each hill. Yield 12 pounds. Very fine.
Hamilton. MRS. J. P. LAM.

PLANTED 10 hills April 18. Good black soil, no fertilizer. Dug August 28. Yield 20 pounds one ounce. A. G. C.
Sycamore.

FOUR eyes, four hills. Dug September 12. Yield 8¼ pounds. Very fine, not a scab or scar. D. B. P.
Pana.

INDIANA.

ONE potato, weight 1½ ounce, yielded six pounds; very dry season. L. B. D.
Courtes.

TEN very small eyes planted April 29, fertilized with phosphate in hill. Dug September 2, yield 19¾ pounds. Flea-beetles destroyed vines, or I would have had more. They are fine. E. W.
Salem.

ONE potato size of hulled walnut, planted in garden, in one hill, yield 3¾ pounds nice, smooth, large tubers. M. N.
Selma.

ONE small potato. Two hills dug and used by mistake, but the remainder yielded 27 potatoes. T. C. C.
Mt. Auburn.

IOWA.

FIVE eyes, in good garden soil, ordinary cultivation. Dug September 29, yield 58 potatoes, weighing 27 pounds. The largest weighed one pound, 11½ ounces. They outyield anything I have ever tried. O. G. H.
Decorah.

SIX pieces planted May 28, were dug September 25. Yield 31 potatoes of good size. They had a poor chance. R. C. S.
Campbell.

ONE small potato started in box in the house, planted out in trench, and fertilized with well-rotted manure. Dug September 9. Yield 38½ pounds, largest weighing 22 ounces. The price of the R. N.-Y. can't buy the product of the little potato.
Tipton. E. A.

TWELVE eyes planted in garden, May 2, level cultivation. Dug September 7. Yield 86 tubers weighing 28 pounds 11 ounces. Largest weighs 23 ounces. M. B.
Corning.

THREE pieces planted May 10, dug September 16. Yield 20 large, smooth tubers, two small ones. Whole weight 10 pounds.
Oasis. D. M. D.

FOUR two-eye pieces planted in one hill on rich ground; came up June 4. Watered with liquid manure. Blossomed June 26. Vines died September 1. Dug September 7. Yield 36 tubers, weighing nine pounds. The largest weighed one pound. N. G.
Cresco.

NINE pieces planted May 15, fertilized with yard-manure. Dug September 11, weighed September 24, 37½ pounds. There were 90 tubers; 40 of them weighed 30 pounds. The largest weighed 20 ounces. Very few small ones. M. Mc C.
Muscatine.

SIX two-eye pieces planted in four-inch trench, May 10, fertilized last fall with stable manure. Dug September 2. Yield 33 tubers weighing 14 pounds, all marketable but three. I am proud of them.
West Union. D. K. G.

KANSAS.

EIGHT single-eye pieces, planted in black, sandy loam, fertilized with stable manure. Ground flooded twice. Yield 68 potatoes weighing 35 pounds, no small ones.
Clyde. A. G. M

SEVEN hills yielded 15 pounds, all nice potatoes. M. B.
Lyndon.

SEVEN pieces in trench, no fertilizer or cultivation, yield 58 tubers weighing 14½ pounds. A. .
Centralia.

MICHIGAN.

CUT to seven pieces. Yield 14 pounds, marketable but three tubers. The potato will prove a success. MRS. J. D. I.
Galien.

WEIGHT of potato, three ounces, very much wilted from being kept till May 5 Cut to nine eyes and planted by the side Beauty of Hebron, White Star, Early Rose and White Elephant. Wood ashes all the fertilizer used. Here is the result:

	TOTAL YIELD. lbs. oz.	FOUR LARGEST lbs. oz.
R. N.-Y. No. 2...	20 14	3 11
Beauty of Hebron	30 4	3 8
White Star.....	24 8	no very large
Rose.....	32	5
White Elephant.	47	7 4

Harrisville. W. A.

FOUR hills. Yield 34 tubers weighing 14 pounds 12 ounces. No fertilizer used.
Hagar. H. N. S.

TWO small potatoes made 14 eyes. Planted May 7, dug October 2. Yield 21½ pounds. Crocker's superphosphate used.
Midland. E. P. R.

POTATO cut to 11 eyes. Yield 31 tubers weighing six pounds 11 ounces. Mixed hen and sheep manure put in bottom of

trench and covered with earth before planting the potatoes. C. F. H.
Clarksville.

CUT to 13 eyes. Plants killed by Flea-beetles. Dug August 28. Yield 11 pounds.
Burnside. MRS. W. S.

POTATOES cut to nine eyes. Planted *à la* Rural's trench system. At the rate of 800 pounds per acre of Chicago Celery Phosphate used over and under the seed. On surface at the rate of 200 pounds wood ashes and a light dressing of compost

THE FARMER'S CLUB

ANSWERS TO CORRESPONDENTS.

[Every query must be accompanied by the name and address of the writer to insure attention. Before asking a question, please see if it is not answered in our advertising columns. Ask only a few questions at one time. Put questions on a separate piece of paper.]

MEAT FOOD FOR POULTRY.

What does the Rural New-Yorker find the most economical meat food for poultry? Where is it bought and what does it cost?

FROM HENRY HALES.

I find the cheapest meat food for poultry is pork scraps in cake. I buy it at pork-packing houses in Paterson, N. J., at two cents per pound. I break it up and soak it in cold water till it is softened and then I mash it up in the soft food. I find poultry more eager for it by far than for the beef scraps broken fine and sold for three cents per pound. The next cheapest fresh meat feed is haslets when they can be procured from a slaughter-house or meat market in quantity.
Ridgewood, N. J.

FROM L. H. MORSE.

I buy kidneys of our meat man for feeding poultry and like them as well as anything.
Newark, N. Y.

FROM P. H. JACOBS.

The best meat food for poultry consists of the neck and coarser portions from the butcher, chopped, and fed three times a week, a pound to 16 hens, or an ounce to each. The cheap portions of the meat will answer. It should be lean—no fat. Liver and lights are also excellent and cheap. I find but little benefit from the commercial ground meat, as its value is reduced by superheated steam and the enormous pressure to which it is subjected before grinding. The Hollis meat is cheap and good, but it must be used before the contents of the can are affected by exposure after it has been opened. Ground meat with ammoniacal odor will be rejected by fowls. I regard ground dried fish as better, though it is not always readily accepted.
Hammonton, N. J.

FROM A. F. WILLIAMS.

The cheapest and best meat for poultry is fresh bone and scraps from the market. Grind these up with a bone-mill which costs only $5 to $7, and poultry will relish them and they will not hurt them.
Bristol, Conn.

FROM SAMUEL WILSON.

The cheapest and best thing we can get in this line is meat and tallow scraps from the butchers' shops. These come in large, pressed cakes about the size of large cheeses, and cost from one to 1½ cent per pound.
Mechanicsville, Pa.

FROM P. WILLIAMS.

Ground beef scraps are the cheapest and I think the best meat for poultry. I buy them in Boston in large quantities and I think they are worth $38 or $40 per ton. The Bowker Fertilizer Company keep them in Boston, and Kirby & W. J. Stanton keep them in New York. Hot water should be poured over them and then they should be allowed to settle over-night.
Taunton, Mass.

FROM JAMES RANKIN.

I consider finely-ground beef scraps the cheapest and best animal food for fowls. I use about 20 tons of it each season, paying from $32 to $35 per ton for it.
South Easton, Mass.

FROM KNAPP BROTHERS.

We find that the best, cheapest und most wholesome meat for poultry for use in cold weather is the flesh of old cows that dairymen are often willing to sell for from $5 to $8 or $10 each as winter is setting in. We have bought in this way two or three at a time oldish farrow cows that were hardly worth wintering. We dress them like beef, and hang the meat up where it will keep good for a long time and use it as required, chopped fine, either raw or cooked.
Fabius, N. Y.

FROM C. E. ROCKENSTYNE.

I feed refuse from a slaughter-house near me. You can get beef scraps in New York: they are good.
Albany, N. Y.

FROM A. J. PERKINS.

We use ground scraps made by C. A. Bartlett, Worcester, Mass. We buy in large lots at two cents per pound. They will keep for months in hot weather. The fowls like them and they answer every purpose as a meat food. We have used them for several years with good results.
Fulton County, N. Y.

FROM E. H. UPSON.

The cheapest meat food for poultry is milk, either sweet or sour. I prefer sour (thick) milk as the fowls seem to relish it better than sweet milk. No other meat food is needed. In the absence of milk any lean meat is good. Fat meat is injurious to poultry as it increases the susceptibility to disease unless fed in very small quantities. Even then it does them no good. As we live on a farm and usually keep one or more cows, the milk we feed our fowls costs us practically nothing. I have come to the conclusion that too much meat is usually fed to fowls. I now have a pen of 10 hens that have been kept in a yard for one year without a taste of meat and only *occasionally* milk. They are in the very finest condition.
Wilmot, Indiana.

FROM ORSON WINANS.

In my locality it is not difficult to get the offal from butchers' shops for nothing. But as to the commercial meat foods prepared expressly for poultry, I am not prepared to say which is the cheapest, that is, which brand contains the best actual value for the money. For myself, I have had some experience with "chandlers' scraps" from the soap factory. I get mine at Catskill, N. Y. It comes in cakes, grindstone-shape, say 2½ to three feet in diameter, four to six inches thick. It consists of lean scraps, bits of bone, the tissue of fats, etc. boiled over a furnace and subjected to great pressure to extract the grease. It has to be broken up with an axe or heavy instrument, and it has to be either powdered fine, or soaked 12 hours before the birds can eat it; as the lumps are hard, I prefer soaking. Fowls either free or confined devour it with great relish after they learn its taste. If fed dry the hens should not be allowed to gorge themselves as it swells or puffs up very greatly by absorbing water or moisture. This article usually costs me at the factory about two cents per pound, and I consider it, all around, about the most satisfactory of anything I can secure. Many extensive poultrymen cook it with grain, vegetables, etc., daily, preferring to feed it that way, but the second cooking is merely a matter of convenience for the fowls.
Oak Hill, N. Y.

CORN WORMS, ETC.

A. H. S., Oswego, N. Y.—1. I send the RURAL some specimens of insects I found in some of last year's sweet corn I was shelling. Do they change into millers, and can the corn be fumigated so as to destroy them without injuring it for seed? 2. I also found and destroyed two white worms about an inch long and about the size of a large pin. They were almost semi-transparent and appeared jointed, or in sections scarcely an eighth of an inch long. I had found them twice before under the border of a carpet. What were they?

ANS.—1. The specimens inclosed are corn-worms. They transform into moths in May; also in July and August. They attack all kinds of grain when stored in bins. The insect in all its forms may be destroyed by subjecting the infested grain to a heat of 167 degrees F. for 12 hours, or to a somewhat lower heat for a longer time. They may also be destroyed by subjecting the grain to the fumes of burning charcoal. The larvæ will also perish if the thermometer falls to zero. 2. The last mentioned probably do not belong to the family of moths usually found under carpets, among clothing, furs, etc. We would suggest, if any more be found, and any trouble be apprehended from them, that specimens be sent to Dr. J. A. Lintner, State Entomologist, Albany, N. Y.

DEHORNING CATTLE.

A. M. J., Lakewood, N. J.—How are cattle dehorned—how held?

ANS.—A full description of the method of dehorning was given on page 365 of the last volume of the R. N.-Y. A narrow stall with a stanchion at one end is best for holding the animal. A strong halter or rope may be used to draw up the animal's head and to hold it quiet. A very sharp, fine-toothed saw is used, and the horn is severed just at the base, leaving a trifle of skin on it. As soon as it is removed, a layer of absorbent cotton is applied to the stump and pressed down to stop the flow of blood. In warm weather a coating of pine tar should be applied before the cotton. No inexperienced person should think of attempting this operation, as, unless properly performed, it is quite likely to prove dangerous, if not fatal. The proper time for dehorning, if it must be done at all, is when the calf is from three to six weeks old. Except in the case of vicious animals, public sentiment seems to be opposed to the practice; and even these are not always subdued, as instances are on record where dehorned animals have inflicted serious injury upon individuals coming in their way.

VALUE OF GYPSUM IN THE STABLE.

F. W. H., Warren, Maine.—How much can a farmer afford to pay for gysum to be used in the stable, the price being based on the commercial value of the nitrogen saved by its use? How much may be used for each cow or horse?

ANS.—Gypsum is always worth its cost for itself alone; whatever nitrogen it may save from loss by combining with the ammonia which escapes from the manure is a clear gain. Another gain is made in the purification of the air of the stables by the absorption of the ammonia that would escape and make the air impure. In using it for the purification of stables, the use of as much as will whiten the floor is about right, but its good effect is not confined to this alone, for in the manure it will always be combining with ammonia. Hence it may be used liberally without fear of loss by so doing.

KEEPING CARNATIONS AND ROSES OVER WINTER.

C. M. C., Monmouth, Me.—How should carnations and tea roses be kept through the winter in this section?

ANS—Lift them and plant them in moderately shallow boxes and close together, but not close enough to press against each other, and winter them on a shelf in the cellar and near the window. Or put them singly in somewhat small pots. Keep them as cool as possible in winter, that is, say between 32 degrees and 40 degrees and avoid a high temperature or a low one. Ventilate freely when convenient, but avoid draughts, and never allow the soil to become very dry in winter. If the roses are strong and have been well ripened, they will not need so much light in winter, but can be kept well enough on the floor of the cellar.

Miscellaneous.

L. M. H., Roxbury, Va.—What is the nature of the process and machinery for manufacturing cedar oil?

ANS.—The wholesale druggists here inform us that most of their product comes from a secret process which requires expensive and complicated machinery.

C. G., Ridgeville, Ill.—1. How far apart should Palmetto Asparagus be set for field culture? 2. Will it get past the first cutting on rich soil without manure?

ANS.—Asparagus in the R. N.-Y.'s estimation is generally planted too close. We should choose four feet by 18 inches for field culture. 2. Yes, but the stalks will be smaller.

B. M. C., Old Point Comfort, Va.—1. What is the proper time for transplanting such trees as beech and live oak? 2. Which is the better time for sowing grass—fall or spring?

ANS.—1. For your climate transplant all deciduous trees now, evergreens in *early* spring. 2. It is now so late that we should prefer spring.

A. S. B., Waynesboro, Pa.—What are the names of the apples specimens of which are inclosed?

ANS.—The specimens were submitted to Messrs. Ellwanger & Barry, of Rochester, New York, who tell us that although the apples are not as fine specimens of their respective varieties as those grown by themselves, still they think that No. 1 is a Fall Pippin; Nos. 2 and 4 are Northern Spy, and Nos. 3 and 6 King (of Tompkins County.) No. 5 they do not recognize.

V. A. T., Chili, N. Y.—1. What is the best early potato for field culture? 2. Is the Early Essex good as regards yield and quality Where canit be obtained? 3. Is the Maine Rose a late potato and is it a good marketable variety?

ANS.—1. In one locality one kind succeeds best; in another, another kind. The only good test is to try different varieties in a small way. 2. R. D. Hawley of Hartford, Conn. It yields well at the Rural Grounds and the quality is excellent. 3. The Maine Rose is the Early Rose raised in Maine.

F. E. E., Sectonia, Ohio.—1. I want to set out about an acre of strawberries. I can buy Bubach No. 5 plants right here for $5 per 1,000, and at a New Jersey nursery for $3 per 1,000. At which place should I buy? 2. I wish to set out about 1,200 blackberry plants next spring. I want a fine-looking berry, of good quality and productive. I can get Agawam and Kittatinny for $10 per 1,000 and Taylor for $5; which should I get?

ANS.—1. If you know the home plants to be strong and good, buy them in preference. The difference in price is scarcely to be considered. 2. We would advise you to try Kittatinny and Minnewaski.

J. W. G., Elkhorn, Canada.—1. How can I obtain the seed of an especially early tomato spoken of by Mr. Falconer in a recent R. N.-Y.? 2. Have soft-wood ashes (those from poplar) and bone ashes much fertilizing value?

ANS.—1. The tomato referred to is probably the Ignotum; the seed will be offered by seedsmen in their forthcoming catalogues. 2. Ashes from soft wood generally contain a larger percentage of potash. According to Dr. Kedzie's estimate, ashes from poplar wood are worth about $15 per ton for fertilizing purposes, although the value of any particular sample could be determined only by analysis.

Discussion.

CULTIVATE OR MULCH—WHICH?

P. H. R., DOWNIEVILLE, CALIFORNIA.—"Plants will grow whether we understand the method of their growth or not," as Prof. Porter says, but the agriculture of the 19th century demands thinkers—such as we confidently hope the agricultural colleges are turning out—hence radical changes in methods ought not to surprise those who have nearly worn out their lives in the vain effort to wear the world out by crippling a side at a time. "Plants will grow;" but will they all grow alike; or will some delve deeply for sustenance while others draw life from very near the surface? Study both ends of your plant. He who has not studied root-growth is ignorant of the fundamental knowledge necessary to the intelligent production of any plant, and if he is successful he is so by the favor of God or because kind Nature holds a bounteous store which the plants may appropriate despite much maltreatment. If we must follow the present generally adopted system of stirring the soil to promote its productiveness, then it follows that we ought to inaugurate the closest system of study of the long-neglected end of the plant. But forces are active which will, probably, greatly change the requirements of food production. New lands are being settled and utilized for the production of their quota of things which may be, for convenience, more susceptible of cultivation than mulching; new knowledge is obtained by the public of facts which lead them to discover the non-necessity for much that has been considered indispensable. Corn is produced solely for the fat there is in it. Is grease king? It is not a necessity and its unstinted use is more condemnable than praiseworthy. Corn is the only important crop that cannot be more easily mulched than cultivated, and to plow up the roots of the plant to produce

"Herbrand" Fifth Wheel for Buggies.

an ear of corn is about as wise as to wash the feet to make the hair grow.

The study of roots would be the best education obtainable by any man who tills the soil. Just remember that, though we often change the habit of the top of the plant, we have never been able to change its root-growth—except by selection—notwithstanding all the root-pruning to which we subject it. It is difficult to kill our garden plants; but we *can* do it, or at least so cripple them as to make them unfit to breed from. This terrible root-destroying process, to which our plants are yearly subjected, makes it necessary to be changing to new originations of plants. "Our varieties run out," the farmer says. What wonder that anything should *try to "run"* when an ignorant, well-fed man with a lively team starts at it with a deep-running shovel-plow! It seems to me folly "of the ordinary kind" to put on a lot of manure to grow a crop of weeds; consequently I do not grow them. But it seems folly "of no ordinary kind" to put on an abundance of manure, and, having grown a strong lot of surface-feeding roots, to mangle them with your implement of torture called a cultivator. I have no plow or cultivator with which to stir the soil after planting. In my method no weeds are allowed to mature; I have water in abundance with which to dampen the soil, when necessary. Now, given a "stirrer" and harrow with which to prepare my seed-bed, what useful purpose will a cultivator serve on my farm? It may be that the plowing, cultivating and hoeing of the ground may be of value in pulverizing the manure lying near the surface, thereby affording the *next* crop a better chance for available material for growth; but the crop *then needing* it is certainly injured. Cultivating may destroy some larvæ; but the most destructive insects do not burrow, and those that do, sink so near the plant, as a rule, that they are not found by the ordinary methods of cultivation. If it is said that manures undergo decomposition from the exposure to light and heat incidental to cultivation, I say that it is more than offset by the early, increased vitality of the plant caused by allowing the ground to become warmer; besides, what does it avail you whether the manure is decomposed or not since there can be no roots in the soil reached by the cultivator? When you use nitrates on the surface in which there are no roots the land must receive just the proper distribution of moisture or your nitrates will leach away in the winter rains. These considerations, added to the facts that manure enriches the soil only for about a foot in depth, and that one-third of that is lost by the system of cultivation generally adopted, lead one to inquire, seriously, whether the hour is not pressing when we should adopt many new methods in modern agriculture?

Yesterday I soaked the ground around a hollyhock that stood 11 feet high, and pulled it up. It had one root that went down, but the rest of its roots were only from one to two inches beneath the surface. Did I plow about it? No. Neither did I hoe it; but flat-lying leaves, like those of the oak, were scattered about it, and water was given it several times during the season, and thus do I raise all kinds of vegetables and fruits in a state as near perfection as may be seen in this country.

Apropos, I shall plant, this fall, wheat in drills and test four methods: Mulching with straw; mulching with boards, only allowing space for the plants to come up; leaving some to fate, while some will be cultivated.

In Mr. Terry's criticism of V. A. S., on page 509, he seems to be "boring pretty close to the lead," as we would say out here. He says, in discussing the propriety of raking off the mulch to cultivate: "It might pay on strawberries where one gets $400 or $500 an acre; but then I would put it back after working the ground." Now, if it were my case, I should consider that, before the season had advanced far enough to make soil-stirring profitable, a considerable amount of vegetable mold had formed in the suface of the soil under the mulch, and that it was precious to the roots of the plant and necessary for the latter's perfect development; consequently I would rather pay for allowing the mulch to rest than for raking it off, cultivating the ground and replacing the mulch. Try mulching on all your crops, leaving it on and giving them a little water if you can. Even a very little water is valuable if put on a good mulch at the proper time. Try this method, and you will wonder how strangely we have clung to the vicious habits of our ancestors. [R. N.-Y. Our readers will remember that this writer lives in California where peculiar conditions of agriculture are found.]

A MILKMAN AGAINST THE SILO.

A. J. T., FRANKLIN PARK, N. J.—Contributors to the RURAL NEW-YORKER from time to time have treated on the advantages of a silo and the use of silage as a factor in the acquisition of a plethoric bank account and I do not now remember having seen within the last year or two a single correspondent who did not strongly favor the silo. In the very teeth, as it were, of so much favorable evidence, it is with considerable diffidence that I venture to offer anything that looks like dissenting from the popular favor in which it is apparent the silo now basks. However, I will state only facts, leaving RURAL readers to form their own opinions. It is now several years since I was seized with the silo fever and while it was at its hottest I erected a silo of medium capacity holding perhaps 70 tons. I have the silo yet, but it is no longer annually stuffed with silage It was built wholly above ground, and as a receptacle for the storage of green food for stock it has proved worthy of the confidence placed in it, all the silage taken from it being of unexceptionable quality and in all respects satisfactory as a wholesome and nourishing fodder for my cattle, so that the fact that the structure has been diverted from the uses for which it was originally intended cannot be ascribed to any inherent defective qualities of the silo itself. It now yearly contains plain honest clover or Timothy hay, which is leisurely stored therein at hay time, and as leisurely and unexcitedly taken therefrom on its way to the feeding mangers later in the season. The reason of this change of heart may be briefly stated as originating in the effort to make silage a staple article of food in a dairy of milch cows, the milk from which was daily forwarded to customers in New York City.

The railroad transportation to the city covered only about 40 miles. The milk was aërated and cooled in the usual way known to any milk dairyman, and left in a tank of ice water until hauled on the afternoon of each day to the railroad station. Every precaution was taken in the matter of cleanliness of the utensils employed and nothing of the most orthodox methods was omitted to make the milk sweet and wholesome. The ration of grain fed with the silage consisted of ground corn and oats together with a proportionate amount of wheat bran and there was no neglect in feeding. A short time after commencing to feed silage, I received a note from the dealer in town asking why I did not send better-smelling milk. I replied, inquiring what was the odor he objected to, adding that it was perfectly sweet when it left my premises. His answer was more emphatic than polite, and included an opinion that unless a reform was at once instituted he could no longer attempt to sell my milk. I was suspicious of the silage, but cordially disliked to be obliged to relinquish my favorite theory that the system of silage was to be the future hope of the dairy interests, and I determined to give it a thorough test even at the risk of losing my customer. With this commendable resolution in view I wrote him that possibly my man at home was at fault in his care of the milk, and that I would give him such a "raking over" as would doubtless improve matters in the milk-house. The "raking over," however, consisted in ordering the man to stop the silage and feed clover hay and the usual ration of grain only. This continued for a couple of weeks, during which time the city milk-man reported an agreeable change in the odor and taste and that everything was satisfactory. After giving him time to settle down fairly to this conviction, I again ordered that the silage should be fed, limiting the quantity to only one feed a day. In two or three days I again heard from town. "What is the matter with your milk? It smells worse than a sour-kraut barrel."

I decided to visit the milk-dealer in person and examine for myself if his fault-finding had any foundation in fact. An hour was selected before he had begun to distribute the milk, and, in fact, before he had opened the cans. He asked me to walk around to his refrigerator and inspect a can, as he unfastened and removed the lid. I did so, and as he quickly pulled off the lid it was deftly turned up side down, thus bringing the cylinder with all its accumulated fragrance directly in contact with my olfactories. The "bouquet" was indescribable, but approached as nearly as may be to that of a combination of stale sugar-house molasses and some kind of acid—something which while not strictly unwholesome, was yet entirely foreign to the usual and natural odor of sweet milk.

"Now," said he, "I don't personally dislike that smell; I could drink milk well enough myself that smelled no worse than that; but my customers are making such a great racket that I shall lose them all if I continue to sell them this milk. You *must* manage in some way to prevent this odor or we shall be obliged to part company—you can see or smell for yourself that *something* is wrong."

Convinced by this time, beyond peradventure, that the silage was at the bottom of the mischief, I reluctantly gave an order to feed the milch cows no more of the stuff. The same dealer afterward continued to take the milk for a long time, reporting it as entirely satisfactory to his patrons. The silage thenceforth was relegated to the young stock or dry cows, much to the disgust of those we were milking, which would any time toss aside good hay to get at a mouthful of silage. Perhaps in a milk business where the fluid is distributed to customers soon after milking no harm would result; but for milk sent long distances to a city market I should interdict the silo by all means.

EARLY KING AND ERIE BLACKBERRIES.

T. GREINER, NIAGARA COUNTY, N. Y.—Some of the largest of these two berries in existence have been under my almost daily observation, during their growing season, for several years, and this may be a sufficient excuse for me to volunteer to add my mite to the literature on the subject. I am quite certain the Erie is distinct from the Lawton, but greatly doubt whether it is very much better. It is the same strong grower, and, if anything, more productive. The berry differs but little in quality, but is plumper or rounder in shape. The cane is exceedingly thorny, apparently healthy and hardy in New Jersey. Its greatest fault is one which it has in common with the Lawton, perhaps even in an intensified degree, namely that of turning red and appearing stale or in the first stages of decay very soon after being picked. A few hours' standing renders freshly-plucked, luscious fruit in the baskets so exceedingly unattractive as to be unfit for sale, and I have known the greater part of a crop left on the bushes to go to waste merely on account of the unwillingness of buyers to accept the ill-looking stuff.

While, on the whole, I think the RURAL NEW-YORKER has spoken too favorably of the Erie, its verdict concerning the Early King does not, in my opinion, do it justice. From first acquaintance, I have always held and still hold the Early King in high esteem as a fruit for the home garden. I have found it the equal of the Early Harvest in earliness, and while the latter, where hardy enough, is a good market berry, it has not the quality which would entitle it to a great deal of respect by the home grower. Here the Early King finds its place, for although the berry is small, it has all the superiority in sweetness and absence of core which characterizes the better kinds of wild blackberries. In cane it seems to be moderately vigorous and healthy, and fairly productive, although not the equal of many others. I believe that it well deserves a place in the home garden, which is more than I would care to say about the Erie.

D. B., COLERAIN, OHIO.—I see in the RURAL NEW-YORKER of October 5, a lengthy communication from G. W. Campbell of Delaware, Ohio, in regard to the Woodruff Red Grape in comparison with the Colerain. He speaks of it as not being so vigorous a grower as the Woodruff. I have measured with a rule the length of the growth of some average vines of Colerain and the Woodruff, without any forcing or the use of any fertilizer whatever. Most of the main shoots made from 10 to 20 feet of growth during the past summer. I measured the entire growth from one bud starting in the spring, and it was 52 feet. If the Woodruff or any other variety can beat that, let us hear from any person who has it through the RURAL NEW-YORKER. Besides, the quality of the Colerain is much superior to that of most other kinds, and its earliness, too, will commend it to all. I do not care to criticize Mr. Campbell's judgment on grapes; but as he says of the opinion of the Woodruff held by the RURAL's editor, on further trial and acquaintance with the Colerain I think he will change his opinion.

THE DRESSED BEEF BUSINESS.

F. E. E., GENEVA, N. Y.—1. The RURAL asks: "Has the trade in Chicago dressed beef made itself felt in farming interests in your section?" Yes. A warehouse at our railroad station practically controls the price of dressed meat. This price is such that local butchers can buy the best dressed meat at a nominal figure; hence if they handle cattle in the home market it must be at a price low enough to compete with the dressed-beef price. There is no longer a demand for tallow at prices for which our butchers will render it, and all the rough fat goes as offal. This throws more of the expense of handling on the carcass and the price on foot must be set low enough for these expenses to fall within the dressed-meat price. Thus the burden is thrown on the stock-raiser and feeder. The price is too low to make it safe for farmers to raise and fatten stock with any certainty at all of making even a small profit on the operation.

2. To what extent has it affected the raising and fattening of beef cattle? My acquaintance with this market has been comparatively short, but from accounts and present appearance it seems the trade in beef cattle has become nearly stagnant. Very few really good beeves can be found. The few I have seen driven to market were scarcely above good store condition, and would bear 30 to 60 days' feeding for a good market.

3. Has it changed the business of local butchers to any extent? Yes. There is a constant pressure to cut Chicago dressed meat from the competition in trade. Each must put before his customers as good an article as that offered by others, and he will buy it from the cheapest source. This by a natural course will soon be the warehouse near the railroad, because the best cannot be profitably produced at home.

4. The business is carried on to the farmer's disadvantage most plainly. The consumer is not benefited in the least by the change, and it is doubtful if the butcher was not better off when he had his old-fashioned dealings with the farmers.

5. What can a person suggest as a means of fairly regulating the matter? This is not an easy question to answer. If one can tell just how to handle the Standard Oil Trust, the Sugar Trust, etc., the meat question can be settled in the same way. The State inspection laws are wrong, because they inferfere with constitutional freedom of trade between the States. It seems that the only feasible legal means is a general law passed by Congress which shall at once grasp the "Trust" principle and break the power of a few monied kings to manipulate the trade of the whole country. This is one of the great questions our legislators have to face and it is only killing time and beating around the bush to pass such measures in our State legislatures as can be construed to conflict with the freedom of trade between the States.

What Others Say

TRUE INWARDNESS.

THE MICHIGAN EXPERIMENT STATION mentions Burpee's Superior, Rural New-Yorker No. 2, June-eating, New Queen and Early Oxford as meritorious potatoes.....

FROM various tests in the culture of potatoes at the N. Y. Experiment Station the following conclusions are drawn, as given by the American Garden and previously alluded to in these columns. Little or nothing is gained by using cut potatoes for seed, over whole tubers of the same weight. Seed tubers badly sprouted yielded about 8½ per cent. less than the unsprouted ones. Earliness of crop was not influenced by exposing the tubers to light and warmth before planting. Yield was materially reduced by removing the seed end of planted tubers. Fertilizer placed below the seed may be slightly preferable to fertilizer placed above it. The more rapid consumption of the seed tuber on rich than on poor soil is probably due to a more abundant supply of moisture.

WHETHER it is better to place the fertilizer above or below will depend upon the season—whether wet or dry. So, at least the R. N.-Y.'s experiments indicate as given in another column of this issue.....

THE editor of the New England Farmer, with this year's experience, is ready to let late potatoes go and depend on but a single variety and that variety will be the Polaris. The R. N.-Y. has tested three distinct kinds under that name.....

THE MARK LANE EXPRESS says that there is a difference of opinion as to the proper time to harvest potatoes. Many farmers prefer raising the crop immediately after growing ceases; others believe that tubers should be left in the ground until

the haulms have fallen, and the weather has become cool. The main point of contention resolves itself into a rather nice question: Do the tubers keep better when lifted early, or later? Some hold that if potatoes are dug as soon as they begin to rot, it will stop the disease from spreading; others dispute this theory under the impression that when the disease has set in, it is best to let the tubers remain in the land until the chill breezes of October come to their aid—to the rescue of the unaffected potatoes. The subject is one which our experiment stations might well experiment upon.....

PROF. I. P. ROBERTS states, in the Breeder's Gazette, that water should be hot—not less than 90 degrees—in order that it may be palatable to animals. His sheep took it without injury and with apparent relish at 105 degrees. In order to induce animals to drink water enough in cold weather to furnish a solvent or disintegrant for the large amount of dry matter consumed, especially by dairy cows, the animal should be kept warm. Some experiments with pigs last winter at the Cornell Experiment Station, seemed to show that those kept in cold quarters were unable to consume as much food as those kept in warm quarters, simply because they could not be induced to drink a sufficient amount of cold water to make assimilable their food.....

PROF. ROBERTS heats the water for all the domestic animals, the station horses included, and he is quite certain that it gives a saving either in food or in increased production of not less than 10 per cent. Farmers are certainly progressing. Fifteen years ago he was hissed off the stage at a dairymen's convention in New York because he advocated heating water for dairy cows.....

PHARO'S POTATO CHART will interest and instruct all growers of potatoes. It is about five feet square and printed upon fine, heavy white paper which may be folded to any size desired. It shows the origin, formation and shape, relative size and time of maturity of the leading varieties of potatoes.....

IT would appear from our reports that there is no other variety that forms its potatoes closer to the main stem than does the R. N.-Y. No. 2, and there is no other that bears so low a proportion of small tubers.....

WE have lost none of our faith in Brownell's Winner, though it would be well, perhaps, to buy "seed" from localities where the rot or blight did not prevail.....

THERE seems to be little doubt that *sound* potatoes will command remunerative prices this year. According to our reports Iowa, Illinois and Indiana have produced the largest crops. Nearly every report we have received from the Eastern States mentions "blight" or that the vines died prematurely. The short crop is in many instances attributed to the Flea-beetle.....

THE MICHIGAN FARMER says the loss by hilling potatoes is estimated by a well-informed grower at not less than 15 per cent. of the crop.....

IN reply to a question as to the relative values of corn in the ear, shelled corn, or crushed corn, Prof. Shelton replies in the Industrialist that the answer is wholly one of cost of shelling, grinding, or crushing. If he had plenty of hogs to follow cattle, he would prefer to feed corn in the ear, according to the familiar plan. If he had plenty of power, and it was easy and comparatively costless to shell or grind or crush, then he would shell, grind, or crush as the case might be. He is satisfied of this, however, that with beef at present prices, and corn at less than 20 cents per bushel, we cannot afford to pay five cents a bushel for shelling and grinding.....

MR. A. I. ROOT says that Henderson's Bush Lima is fully equal in flavor to the pole Limas. He says that a peck of pods will make more quarts of shelled beans than a peck of large Limas. Mr. Root further says that it has been catalogued for years as the Dwarf Sieva. He thinks that the Kumerle will prove a wonderful acquisition.....

MR. HOARD says that practical dairymen are now milking cows that breed once per annum, about 11 months of the year, keeping them well enough fed, so that there is a good flow of milk and a healthy, vigorous calf, too. A good cow's milk for two months, is worth more than a common calf at birth.....

THE FARMERS' REVIEW trusts that the season of farmers' institutes now about to open will be the most successful on record, and in order that this may prove the case it hopes politics will be entirely left out of the question at such gatherings and strict attention be paid to agriculture and its truly kindred topics. The only cloud in sight that threatens to dim the bright record of our farmers' institutes is this ghost of politics, which has already appeared upon more than one occasion. To the managers of these annual conventions of farmers we would strongly suggest this idea and advise them to substitute the names of practical farmers for those of professional-circuit-going politicians in printing the programmes for the approaching institutes. Leave them out!.....

AN experienced writer in that incomparable journal the London Garden, says that potatoes need no drying, and if lifted, as they ought to be, in favorable weather they may be stored as fast as dug.....

THE following note is copied from the London Garden of September 21st:

"RURAL NEW-YORKER POTATO.—In the spring of 1888 I received a potato from New York, for trial. It was called Rural New-Yorker No. 2; but as the season turned out unfavorable, I resolved to give it another trial before forming or expressing an opinion on it. This spring I planted the produce of one of last year's plants, and have just dug the crop, and a finer lot of tubers I never saw, there being no really small ones, but all of good average size. Several are one pound in weight and of most excellent quality. It is a white potato, very solid, with shallow eyes and oval shape, just the thing for a main-crop variety. I may add that the potatoes were planted between rows of young fruit trees, and in a quite open position the crop would doubtless have been heavier. The tubers were simply cut up to a fair seed size. The crop from one medium-sized potato in two seasons, amounted to fully two bushels of fine sound tubers.—J. Groom, Gasport."....

ABSTRACTS.

——FARMERS' REVIEW. "The RURAL NEW-YORKER, after quoting portions of an editorial published in a recent issue of the Farmers' Review, relative to the analyses of baking powders made by the Department of Agriculture, says:

'The RURAL NEW-YORKER quite agrees with the spirit of the article above quoted, and the Farmers' Review does good service in thus forcibly condemning such apparently needless work. Turning from the shortcomings of the Department of Agriculture, the RURAL NEW-YORKER would feel pleased if the Farmers' Review would heartily join it in condemning a culpable piece of business in which certain farm journals are engaged. The publishers, owners, proprietors or editors, as the case may be, of these papers are pecuniarily interested in booming certain Montana lands. They praise them up to the skies editorially, while their advertising columns are liberally given up to Montana advertisements. Now all this is being done while the readers of these journals are kept in ignorance of the fact that the editors or proprietors are cracking up the lands in which they own a share and for which they are striving to obtain the highest price.'

The Farmers' Review heartily indorses the position taken by the RURAL NEW-YORKER on this question. It is certainly beneath the dignity of any agricultural newspaper having the interests of its constituents at heart to lend itself to advertising schemes of that nature; and the paper that seeks to build up its financial prosperity on the sands of real estate speculation, outside the paths of legitimate journalism, is a disgrace and reproach to the whole fraternity."

——BALTIMORE AMERICAN: "Charges of plagiarism still continue. It is now hinted that successful and hitherto unsuccessful farmers crib the stores of their corn magazines from Nature's cereals."

——MICHIGAN FARMER: "The trench system of culture of potatoes, which is a hobby with one of our esteemed agricultural contemporaries, is almost universally conceded by those who have tried it to be good for a small plat but too expensive for field culture."

——DR. HOSKINS, in the Vermont Watchman: "'Gardeners, as a rule, are in favor of changing the seed of potatoes frequently. Experience seems to have proven the desirability of this change, and leaves little doubt but that planting the same kind year after year on the same soil tends to weaken the variety.' So observes an exchange, but the statement is true only of gardeners located south of the true potato belt. Where the potato is at home, and well treated, on suitable soil, it will improve rather than weaken."

——PHILADELPHIA PRESS: "A farmers' club is the proper weapon with which to stir up agricultural interests."

——"TO THE BREEDER'S GAZETTE it seems that Secretary Rusk sized up the situation exactly when, after an examination of the butter extractor, he said sententiously: 'This means revolution if it means anything.' And it is not a revolution backward, either."

——TRIBUNE, OF ROME, N. Y.: "The national flour should be wheat."

"In poultry circles, the old hen generally proves her good standing by sitting."

——READING TELEGRAPH: "Corn is an emblem of peace, but it is never appreciated until it gets on its ear."

——ORANGE COUNTY FARMER. "The consumer knows the tendency of the small fruit to sift through to the bottom, and instead of being willing to pay for a package of fruit like the top, he is willing to pay only for such fruit as is at the bottom."

"A hard-handed tiller of the soil was presented with a sample copy of an agricultural paper at one of the county fairs recently. He refused to give 25 cents for a trial subscription because 'times were hard and money scarce,' and with a knowing wink in his off eye passed on. He stopped at a striking machine, not four rods from the paper man, fumbled the copy of the paper into a ball, thrust it down into his pocket, and blew in just 45 cents to show that he couldn't strike any harder than a smaller man who followed the business for a living"

——CORRESPONDENT, N. Y. TRIBUNE: "If a German sits down on a piece of land, you can almost insure his success. Two Germans, now better off than myself, worked for me by the day 20 years ago."

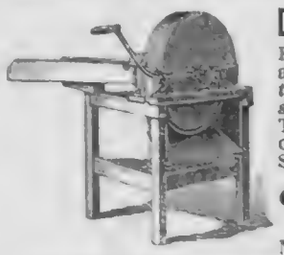
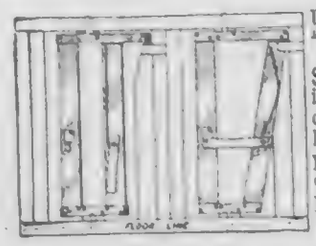
Hood's Sarsaparilla
100 Doses One Dollar

It is Economy to buy Hood's Sarsaparilla, because it is the only medicine of which can truly be said: "100 Doses, One Dollar." It possesses peculiar strength and curative power, and effects cures where other preparations fail. Try it, and you will realize its merit Sold by all druggists. Be sure to get Hood's Sarsaparilla.

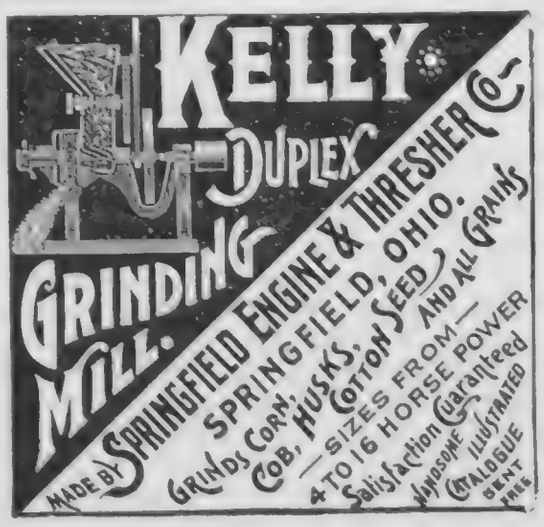
NOTHING ON EARTH WILL **MAKE HENS LAY** LIKE SHERIDAN'S CONDITION POWDER
Highly concentrated. Dose small. In quantity costs less than one-tenth cent a day per hen. Prevents and cures all diseases. If you can't get it, we send by mail post-paid, One pack. 25c. Five $1. 2 1-4 lb. can $1.20; 3 cans $5. Express paid. Testimonials free. Send stamps or cash. Farmers' Poultry Guide (price 25c.) free with $1.00 orders or more. I. S. JOHNSON & CO., Boston, Mass.



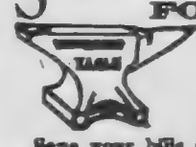
DICK'S FEED CUTTER
For Hay, Straw and Ensilage. *The only machine that cuts and splits corn stalks.* We also sell the TRIUMPH STEAM GENERATOR, and GRIFFING'S CORN SHELLER AND SEPARATOR. Write us at once H. B Griffing, Sons & Co., 70 Cortlandt St., New York City. N. Y.



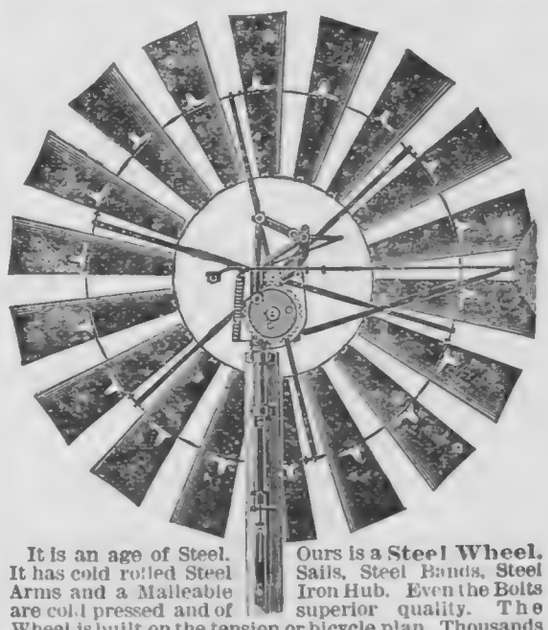
BOON to DAIRYMEN
Perfect Swinging Cow Stanchion. Self-locking by entrance of cow's head. Free delivery at principal points. Send for circular. Mention this paper. Scott & Locke, Orford, N. H.



SOMETHING TO HAMMER ON, FOR FARMERS.



ANVILS.
Save your bills at the Blacksmith's and Machine Shop by having on the farm one of these celebrated ANVILS—*fully warranted*, and of the best material.
Best Hardened Cast Steel Face and Horn.
All sizes, from 20 lbs. to 90 lbs., at from $6.00 to $8.00 each. Larger sizes at 9 cts. per lb. Address, for Circulars, &c., FISHER & NORRIS, Original and Only Manufacturers. Trenton, N. J.



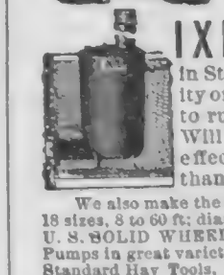
It is an age of Steel. It has cold rolled Steel Arms and a Malleable are cold pressed and of Ours is a **Steel Wheel.** Sails, Steel Bands, Steel Iron Hub. Even the Bolts superior quality. The Wheel is built on the tension or bicycle plan. Thousands of them are in use. They have been and are sent the world over **on approval.** $50 buys our perfect Self-regulating Steel Aermotor which does as much work as any 10-ft. wooden wheel. $100 buys our perfectly Self-regulating Steel Geared Wind Mill for grinding grain, cutting feed, sawing wood, etc., which does as much work as any 16-ft. wooden wheel. We are the only makers of a Tilting Tower that **never has to be climbed.** It saves human lives and doubles the life of the wheel. **The Aermotor runs and does effective work when all other wheels stand idle for want of wind.** Send for copiously illustrated printed matter showing how to put power in your barn. ***THE AERMOTOR CO.,*** 110 & 112 S. Jefferson St., Chicago.

EVERY FARMER HIS OWN MILLER DO YOUR OWN
Shelling and Grinding at home, saving tolls and teaming to and from the Grist Mill. This work can be done rainy, windy days when out-door work is suspended on the farm. The same Mill will cut corn stalks, saw wood, run churn, grindstone, pump water, etc. We make the HALLADAY Geared Wind Mill in 11 sizes, 1½ to 40 horse power, and GUARANTEE they have no equal for Power, Durability and Storm Defying qualities.

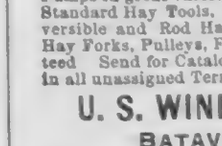
1 X L 2-HOLE Corn Sheller
Adapted to run by hand, horse, steam or wind power. Not cheaply made but strong, durable and effective in its working yet light running. It is constructed similar to the large Power Shellers and is the best 2 Hole Sheller on the market.

HORSE POWERS
and JACKS, both single and double Geared, made heavy and strong.

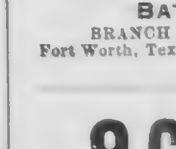
THE IXL STALK CUTTER
made in 5 Sizes, with Safety Fly-Wheel, Safety Lever, and all late improvements.



THE IXL IRON FEED MILL
3 sizes, both Belt and Geared Mills. Can be run by any power and especially adapted to Wind Power. Will grind any kind of grain and is the lightest running and most effective Feed Grinder made.



SAW TABLES
Both Swinging and Sliding Tables. We make a Saw Table especially adapted to sawing long poles. Special care is taken to make these machines strong and durable.



IXL TANK HEATER for warming water in Stock Tanks. Made of the best quality of iron cast in one piece, no sheet iron to rust or solder to melt and cause leak. Will burn any kind of fuel. It is very effective and takes less care to operate than any other Heater made.

We also make the HALLADAY PUMPING WIND MILLS. 18 sizes, 8 to 60 ft; diameter and 1 man to 40 horse power. The U. S. SOLID WHEEL WIND MILL, 7 sizes. Iron and Brass Pumps in great variety. Tanks, all kinds and sizes, and the Standard Hay Tools, consisting of Anti-Friction, Swivel, Reversible and Rod Hay Carriers, Harpoon and Grapple Horse Hay Forks, Pulleys, Floor Hooks, etc. All goods fully guaranteed Send for Catalogue and Prices. Reliable Agents wanted in all unassigned Territory.

U. S. WIND ENGINE & PUMP CO.
BATAVIA, ILLINOIS, U. S. A.
BRANCH HOUSES:—Kansas City, Mo., Omaha, Neb., Fort Worth, Tex., Boston, Mass

9 Cords IN 10 HOURS
Runs Easy. NO BACKACHE

BY ONE MAN. Write for descriptive catalogue containing testimonials from hundreds of people who have sawed from 4 to 9 cords daily. 25,000 now successfully used. Agency can be had where there is a vacancy. A NEW INVENTION for filing saws sent free with each machine, by the use of this tool everybody can file their own saws now and do it better than the greatest expert can without it. Adapted to all cross-cut saws. Every one who owns a saw should have one. Ask your dealers or write FOLDING SAWING MACHINE CO., 808 to 811 South Canal Street, Chicago, Ill.

THE
RURAL NEW-YORKER,
(34 PARK ROW, NEW YORK),

A National Journal for Country and Suburban Homes.

Conducted by
ELBERT S. CARMAN.

SATURDAY, NOVEMBER 2, 1889.

THE reports of the Womens' National Potato Contest are now in the hands of the judges and the prize-takers will be announced as soon as practicable.

THE R. N.-Y.'s ADVICE TO FARMERS: *Don't save for seed potatoes or purchase seed potatoes which, owing to rot, blight or any other cause, failed to mature fully.*

IT is worthy of note that the R. N.-Y. seedling potatoes from seed (true seed) planted last February, blighted as early as established varieties growing in neighboring fields.

FARMERS who have received letters from "Webb & Warren" of Philadelphia, offering to purchase butter, are advised to "go slow." The R. N.-Y. will print what it knows about this firm next week.

ROT, Flea-beetles and blight! These are the enemies that we had to contend against in potato culture the past season. The R. N.-Y. met these enemies and fought them with all its might. But it met with a disastrous defeat.

"THERE'S no use talking, we farmers with hilly farms have to come to the use of swivel plows. The old plows leave too many dead furrows for rains to wash through and start a gully." That is the way a New Jersey farmer recently put it and there are many others who will agree with him.

IN a wet season, put the fertilizer *over* the seed potatoes; in a dry season *under*. That is, thus far, the result of the R. N.-Y's. tests. But how is one to know whether the season is to be wet or dry? Well, read the R. N.-Y. If it predicts a *dry* season, its readers may assume it will be WET!

MR. E. L. GAULT, Treasurer of the Keystone Manufacturing Company, writes:

"Your excellent paper with the high standard you have recently placed it at, is a work of art well worthy of careful preservation and a fit representative of American agriculture. We wish you every success!"

HOW HIGH will potatoes go? Seed potatoes will be high next spring, but potatoes for the general market will not vary much in price from other years of scarcity. Customers seem to have settled upon an intrinsic price for potatoes. When the price goes above that, consumers will eat rice instead of potatoes. Again, whenever the price reaches a certain limit, we shall find European potatoes in our markets. Two years ago this happened; it will happen again next spring.

A. W. LIVINGSTON'S SONS send the following note:

"WE must tell you of our experience thus far with the Kumerle Dwarf. Last winter we were fortunate enough to secure half a dozen packets containing 25 beans each. We did not test them because our friend Mr. Root, of Gleanings in Bee Culture, offered us 'their weight in gold' for them, and we accepted, receiving $78. This we considered our golden opportunity to make first sale of this promising variety."

PROF. C. M. WEED reports the successful use of the Bordeaux Mixture on potato vines. Applications were made May 28, June 6, June 29 and July 16. The blight appeared in the field about the middle of June and for six weeks did serious damage. Prof. Weed says that the sprayed vines remained green longer than those not sprayed with the mixture, and the yield is reported as being nearly 20 per cent. heavier on the sprayed portion, while it is claimed that the tubers were also free from scab. By adding London-purple to the Bordeaux Mixture Prof. Weed says we may fight the blight and the beetle at one operation. The R. N.-Y. tried the Bordeaux Mixture without any apparent benefit.

ATLANTA, by far the most populous, enterprising and important city in Georgia, is rejoicing at a recent decision of the Georgia Farmers' Alliance, which has selected the "Gate City of the South" as the place where it will build a large warehouse, through which all the supplies for the entire Alliance in that section will be handled. This means that the trading of 80,000 farmers will be done in Atlanta. The design of the Alliance is to do away with middlemen and cut down as much as possible the expenses connected with the purchase and sale of all farm supplies and products. This is an excellent idea which has for years been, here and there, put in practice by the Grange to a limited extent, and by the Alliance to a greater extent in several States, but especially in Texas. The greater the amount of business done, however, the greater the risk of mismanagement and partial or total failure; for while it is comparatively easy to secure a man capable of successfully managing a small business, it is a mighty difficult matter to find one able, honest and unselfish enough to manage a large one successfully.

THE reports of the R. N.-Y. potato No. 2—page 724—are all that space permits in this issue. They will be read with interest as showing in what soils and under what conditions the potato thrives best. Readers will kindly bear in mind that the R. N.-Y. can have no interest in praising this remarkable variety beyond its deserts, since the entire stock (a matter of two bushels) was sold several years ago to a single firm who propagated and introduced it. We have never raised it for sale, have none for sale and do not ever expect to have. It is all we have to show as the result of 12 years of work with seedling potatoes, the No. 3 and No. 4 having failed through rot and blight. Its value to the country—be it great or small—will be the sole measure of our reward.

The reports show that a careful man, who is willing to take pains with a small thing, can produce results well worth considering. The specimens of the potato that were sent to subscribers were, of necessity, small ones. Many of them, after their long journey by mail, were anything but promising in appearance. The R. N.-Y. has never distributed any seeds or plants that did not give promise of excellence. Those of our readers who believed in this fact went ahead with their little potatoes. When the price at which the potato is to be sold is announced, we shall see how many have paid for their year's subscription by their work with the little potato.

FAILURE OF THE NO. 3 AND NO. 4 SEEDLING POTATOES.

AS has been stated more than once in these columns, the RURAL NEW-YORKER seedling Potato No. 3 outyielded the No. 2, planted side by side, and the R. N.-Y. No. 4 outyielded the No. 3. Both varieties were shapely and of the first quality. It will also be remembered that our effort to raise at the rate of over 700 bushels to the acre last year failed on account of the trifling yield of the No. 3 caused by the destruction of the vines by the Flea-beetle. The best of the tubers were saved for seed and planted this year. Again the Flea-beetle destroyed the vines and the variety no longer exists. Worse than this, the No. 4, on account of rot and the Flea-beetle, seems so weakened that it may well be doubted whether it will ever regain its original vigor. We had hopes for these two remarkable varieties more confident even than for the No. 2, and looked forward with a deal of satisfaction to their early introduction to the farming public. Well, perhaps it is better to have labored earnestly and failed than not to have labored at all.

DANGER AHEAD.

IN the Northwest and still more in the South the Farmers' Alliance is taking quite an aggressive line of action not only in political but also in economic affairs connected with the agricultural interests. Until a comparatively recent date, the Grange strongly objected to any interference on its part as an organization in political matters; but of late it has changed its policy in this respect, having learnt that in order to advance the best pecuniary welfare of farmers, it must take decided action with regard to legislation certain or likely to affect their interests. From its inception, however, the Alliance has taken a prominent part in politics, now favoring one party, now the other, even in the same section, its course being directed by the influence it conceived the policy of either party would have upon the agricultural interests of the region. Its membership and influence are growing faster in the South than in any other section, and there is some danger that it may there be led into a policy that may cause it to lose the sympathy of the community at large. In South Carolina the war it has been waging against the Jute-bagging Trust is gradually involving side issues of a somewhat serious character. It began by boycotting the manufacturers and dealers in jute-bagging, and now it is extending the same method of intimidation to newspapers, towns and cities against which it believes it has any cause of complaint. One of the five daily papers published in the State, has been boycotted because the editor published something that displeased the Alliance men; the city of Greenville, the third in size in the State, is suffering from a stagnation in business due to a similar boycott; Spartanburg, the fourth city in the State, has also been boycotted by a local Alliance; while Charleston, the chief city in the State, has been boycotted by the Sumter County Alliance, whose members are forbidden to buy goods or send any cotton there. The boycott is probably the most persuasive means of coercion ever practiced by the many against the few. Still there is about it something brutal that is sure, in the long run, to enlist public sympathy in favor of its victims, if it is used too frequently or too persistently, and unsupported by public sympathy it is up-hill work for any movement, however beneficent, to succeed.

A GIGANTIC ORGANIZATION OF MILK PRODUCERS

IT is estimated that the milk bill of New York City amounts to $10,000,000 a year. The vast supply is furnished by about 10,000 farmers and milk-producers living in New York, New Jersey, Pennsylvania, Connecticut and Massachusetts, and is handled in the city by about 100 milk-dealers who are members of the Milk Exchange. This small body of middlemen organized for self-interest absolutely controls the price paid to 10,000 unorganized producers and demanded of 1,500,000 unorganized consumers. The latter cannot well form an organization; the former should have no great difficulty in doing so. A similar organization has been in successful operation for supplying the London market for 19 years, and surely what Englishmen have done for a city of 4,500,000 people, Americans can do for a city containing only one-third of that population. The first important step to that end was taken last Thursday at Middletown, N. Y., at a mass-meeting of 300 farmers from the five States that supply the city with milk. The design of the convention was to push the organization of a milk-producers' union to be known as the "The Union of Milk-Producers for the Supply of the New York Market." Its object is the formation of a vast trust to control the city milk market, do away, as far as possible, with middlemen, supply the consumers direct and regulate prices. There is no doubt that such an organization can furnish the metropolis with purer and better milk, at retail, for five cents in summer and six in the winter than that now supplied by the Milk Exchange at six and eight cents. Nearly all the adulteration which is now so objectionable to adults and so fatal to children is the work of the milk-dealers, and this cause of just complaint would be at once removed, while the producers and the consumers would be alike gainers by the success of the undertaking. The scheme originated at Oxford, Chenango County, about eight months ago, and already 30 local branches have been organized and 10 more are in process of formation, and such an impetus has been given to the enterprise by the Middletown Convention that it is expected that by next spring the time will be ripe for the organization of a stock company. This is intended to have a capital of $500,000, to be contributed by milk-producers at the rate of one share of stock, at $25, for each 40-quart can furnished per day. An agent will be stationed at each shipping point to receive and forward milk and cream, and there will be a central distributing depot at this city. It is expected that 200 branches will be established within the next three months. The plan is admirable and feasible. This is, *par excellence*, the era of organizations, and farmers who do not organize for self-protection and self-interest are not keeping up with the age.

BREVITIES.

WHAT do you think about rot in potato "seed" now?

WE have not succeeded in procuring any seed-balls of the No. 2.

THE R. N.-Y. has no occasion to feel sad that its potato challenge of $100, to go to some charity, was not accepted.

THE entries for the prize offered for the "Notes on a Back Number" are coming in lively. This will be an excellent "symposium."

THE indications are that there will be a revival of the interest in sheep. This is due to the continued dullness in cattle and hogs at the West.

WE have not succeeded in getting a single seed-ball of the R. N. Y. No. 2. We were in hopes that some of our North-western friends might favor us.

THE Dwarf Lima Bean Special has called out a good deal of comment. Next week Prof. J. L. Budd will detail his experiences in cutting back the ordinary pole Lima.

THE proportion of rotten potatoes raised in the barrel experiment was greater than the proportion of rotten potatoes raised in the "Contest Plot." It is difficult to account for this.

PROBABLY about the middle of next year some of our esteemed contemporaries will begin to talk about the auction system of selling farm produce which the R. N.-Y. has already described.

A BARBED Wire Trust has just been formed to tighten the grip of the manufacturers of barbed wire on the pouches of farmers and stock-raisers. It embraces nearly all the manufacturers in the country and has already put up the price of the product, and is expected to make another advance before long. As the patent monopoly steps out, the trust monopoly steps in.

SOME of our readers find fault with the R. N.-Y.'s cartoon pictures of the farmer. We have a picture coming now that will cause such readers to "take it all back." We have a photograph of five representative Illinois farmers who, as our correspondent states, "started with 0 and ended with 000." They are typical farmers, each one representing some distinct branch of agriculture or horticulture. This picture will give further evidence of the wonderful resources of photo-engraving.

WHAT is the cost of living in your neighborhood? This is a live question. In these times it is hard to think of one that is more important. Next week the R. N.-Y. will begin the publication of statements showing the cost of living in various parts of the country. All who have kept accurate accounts of their living expenses are requested to compare their accounts with those we shall publish and send us the statement. The R. N.-Y. thinks a good deal of help may be gained in this way.

WHILE bee-keepers at the North are agitating for legislation against the spraying of fruit trees with arsenites during the blossoming season as a protection against fruit-injuring insects, sportsmen at the South appear to have an equally valid cause for legislation against the use of Paris-green by cotton-planters for the destruction of the cotton worm. Complaints come from many quarters that the liberal use of this arsenite has been playing havoc with the game birds, which fed upon the poisoned worms, of which they are very fond. Partridges and prairie chickens which were very numerous in many regions have, it is said, been nearly all destroyed. Whole flocks having been found dead in many places. There is danger that unless the worms are saved from the poison, the sportsman's occupation will soon be gone in wide areas. Just as it's an ill wind that blows nobody good, it's a good wind that blows nobody ill.

Everywhere.

RURAL POTATO REPORTS.

(*Continued from Page 725.*)

Yield 14 pounds 6½ ounces, 14 pounds and one ounce marketable. Quality fine.
Sodus. O. B.

MAINE.

TEN pieces were planted May 5. Blight struck them August 1, and they were dug August 10. Yield 10 pounds three ounces, all marketable but four ounces. They were the handsomest potatoes I ever saw.
S. Deer Isle. G. L. R.

POTATO weighed three ounces and was cut into 13 pieces, put into a box in March, and set out in row, 12 inches apart, May 4. Yield 42 potatoes weighing 19 pounds, largest weighed 20½ ounces. F. W. H.
Warren.

MISSOURI.

EIGHT eyes planted April 10. Dug August 16. Yield 16 pounds. W. H. R.
St. Louis.

MINNESOTA.

FOURTEEN pieces planted May 2, dug September 13, yield 53 tubers weighing 18 pounds. Largest weighed one pound.
Grand Meadow. F. S.

TEN pieces planted on land without manure for four years. Yield 14 pounds, two ounces, largest weighing 14 ounces.
Pine Bend. F. M.

TEN eyes were nipped by frost, then nearly dried up. Dug September 30, yield nine pounds, 13 ounces, largest weighing 14½ ounces. M. M.
Minnesota Lake.

SIX pieces, planted about middle of April, dug October 4; 24 merchantable, 11 small; bad drought. W. McP.
Strother.

NEW YORK.

I CUT my potato, about the size of a hickory nut, in two pieces, and planted in a six-inch trench June 1, with a handful of bone dust and ashes above and below each piece with soil next the seed. The largest 11 weigh 11 pounds one ounce. The largest four weigh 26, 25, 23 and 19 ounces respectively; all good-shaped potatoes. P. A.
Perry.

I PLANTED my potato in eight hills May 16. So wet we could hardly cultivate them. Dug September 1; yield, 19½ pounds. One weighed two pounds, another one pound 11 ounces; only two or three too small to use; no rotten ones. S. T. B.
Collins Center.

I PLANTED 14 one-eye pieces in hills three feet apart each way; 12 grew. Blighted August 10. Dug September 1—30 pounds. Largest seven weighed 7½ pounds; one weighed 22½ ounces; remarkably smooth. No signs of rot, though other varieties are rotting badly. I would not give my 30 pounds of potatoes for three times the subscription price of the R. N.-Y. D. M.
Brookdale.

SIX eyes planted in garden May 10. Dug September 18, yield 14½ pounds, all sound.
Dempster. N. P. S.

PLANTED seven eyes. Dug August 31, 23 pounds, nearly all of eatable size. The largest weighs one pound 10 ounces.
Stockport. F. P.

I PLANTED my potato, and by cutting it in two and taking off sprouts, I made nine hills. Top-dressed with ashes, and mulched with new-mown hay. Blighted early. Dug September 10. Yield 16 pounds in all. Only three were small. The largest five weighed 24, 19, 17, 17 and 15 ounces respectively. No signs of rot. E. C.
Hoosick Falls.

I PLANTED my 13 potatoes cut to one eye, about May 20, on sandy loam. I plowed trenches four inches deep, scattered ashes and hen manure, mixed it with the soil, dropped the seed, covered with one inch of soil, scattered more ashes and hen manure, put on another inch of soil and filled up the trench as the potatoes grew. Flea-beetles attacked them, and blight struck them, but I got 13 pecks all of large size, the largest weighing two pounds. They are the finest lot of potatoes I ever saw, and are free from rot. I. P. W.
Fredonia.

THREE eyes, three hills. Hurt by frost. Yield 5¼ pounds. No bugs or beetles on the vines while other varieties suffered. The best potatoes were where I used stable manure. A. R.
Marilla.

FIFTEEN eyes from two small potatoes. I relied on the R. N.-Y.'s guess of a dry season and planted on my wettest soil. Used at the rate of 1,000 pounds per acre of Homestead phosphate. Failure. Yield only 7½ pounds. C. M. L.
W. Henrietta.

"A LITTLE dried-up thing" cut to four pieces. A table-spoonful of Bradley's phosphate in each hill. Yield 11 pounds. It is the "coming potato." R. H. T.
North River.

SEVEN eyes. Planted in trench. Yield 16½ pounds. C. H. F.
Forestville.

EIGHT eyes planted May 11 in trench, with a liberal application of phosphate. Dug September 27. Yield 50 potatoes weighing 15 pounds. The largest weighed 26 ounces. D. H. S.
Middleport.

THIRTEEN one-eye pieces were planted May 1 in trench in rich soil, fertilized the previous year with yard manure. Total yield 11 pounds, one-fourth pound unmerchantable. Five tubers weighed five pounds. Two weigh 1½ pound each. J. H. C.

TWO small potatoes made 12 eyes. Fourteen inches apart, trench system, four inches deep. Yield 24 potatoes, 19 marketable. R. C. F.
Sinclarville.

FOUR eyes. Hog manure used. Dug September 13, 15 tubers, weighing six pounds. J. D. H.
Constableville.

ELEVEN eyes, two with flesh no larger than peas. Dug September 17. Yield 19¾ pounds, 40 potatoes, 36 marketable. J. H.
Ea. Aurora.

BY cutting to single eyes and dividing the largest I secured 14 sets. Planted in a trench eight inches deep. Liberal dressing of "Unicorn" phosphate. Trench filled in at intervals. Yield 34½ pounds. No rot, though other varieties suffered. This potato has a future. R. N. L.
Red Hook.

THREE eyes sprouted in the basin. Potato yield five pounds 10 ounces. A. H. H.
W. Bloomfield.

EIGHT eyes. Yield 31 potatoes weighing 10¼ pounds. J. W. H.
North Greece.

FOURTEEN eyes, 14 hills. Yield 21¾ pounds. Much pleased with yield and potato. MRS. A. J. G.
Adams Center.

TWELVE eyes. Planted in garden and well fertilized. Yield 33 pounds.
Porterville. A. L. B.

ELEVEN eyes, cut in four pieces and planted in two hills in garden soil enriched with wood ashes. Yield 4¾ pounds. Another variety a few feet away rotted so badly that 12 hills yielded less than the two hills of No. 2. H. B.
Cobleskill.

NEW JERSEY.

I PLANTED my potato about May 8 in the field with other potatoes so they received only ordinary culture. Blight struck them before maturity. Dug September 7, yield 54 tubers. Weight 12 pounds 2 ounces.
Freehold. D. P. M.

SIX hills yielded 11½ pounds, one of which weighs 1¼ pound. They are very fine-looking potatoes. P. S.
Hillsborough.

SIX eyes planted in a box, produced 14 plants. Planted out six of them early in May, destroyed by bugs. Latter part of May planted remainder, which gave me 22 tubers weighing five pounds. J. W.
Vineland.

EARLY in May I cut my potato in five pieces, and put it back in the box a few days before planting. Fertilized with poultry droppings and phosphate. Had five pounds of handsome tubers. S. P. F.
Vineland.

I CUT my potato into 10 one-eye pieces, and planted April 20, in sandy loam, in a trench. I put the cut sides down, put on an inch of soil, then at the rate of 1,000 pounds of potato fertilizer per acre, and filled the trench nearly full. Bugs bad, and blight killed tops. Dug, August 15, 21 potatoes, weight three pounds six ounces; several rotted. Nice, smooth, good shape.
Westfield. C. R. W.

NEW HAMPSHIRE.

ONE tiny little tuber made seven hills of one eye. Dug, July 30, 4½ pounds. Blighted July 16; not a fair trial. MRS. B. B. C.
S. Sutton.

THIRTEEN very small one-eye pieces were planted June 1. Dug last of August. Yield 38 tubers, weighing 7¾ pounds. Not one has rotted, while every other sort we planted has rotted more or less. F. E. S.
Hudson Center.

NEBRASKA.

FIVE hills, level culture, no trench, yield 22½ pounds, largest tuber 26 ounces. Largest perfect shape 18 ounces. L. C. B.
Nebraska City.

SIX pieces planted in garden, yielded 17 potatoes, largest weighed 10 ounces.
Tilden. I. N. F.

TWELVE pieces, yield 122 potatoes of marketable size, weighing 42 pounds, and two pounds small ones. Largest five weighed five pounds. Hoed once. H. B.
Humbolt.

TWO pieces planted May 10, in trench. Yield 70 potatoes weighing 55 pounds.
Delta. A. N.

POTATO weighed three ounces. Yield 20 pounds, 14 ounces. No manure. S. L. T.
Fairfield.

ONE small tuber planted May 21, yield 76 potatoes weighing 26 pounds. Largest five weighed 4½ pounds. Largest weighed 18 ounces. H. F. W.
Newport.

ONE tuber planted May 10, had two hoeings, dug September 28, yield 22½ pounds, the largest weighed two pounds five ounces.
North Loup. H. H. S.

OHIO.

TWELVE eyes planted April 20. No extra care, badly injured by bugs. Dug September 25. Yield 25 pounds, fine, smooth tubers; largest one weighed 20 ounces.
Bellefontaine. G. A. H.

FOUR hills, fertilized in hill with well-rotted stable manure. Flea-beetles killed vines before blossoming. Dug August 29, yield 15 potatoes weighing 3¾ pounds.
W. Middleburgh. J. W. B.

TWENTY-ONE pieces were planted on moderately fertile, sandy soil about April 15, in a trench, fertilized with potato fertilizer. Dug September 18; yield 85 tubers weighing 4¼ pounds, largest 19 ounces.
Rockport. W. A. B.

THREE pieces planted according to R. N.-Y. trench system. Yield from two hills 13 potatoes weighing 10½ pounds. Nine weighed nine pounds; the largest two weighed 2½ pounds. H. S.
Edgarton.

EIGHT single-eye pieces in poor soil, yielded 42 potatoes weighing 14 pounds. The largest weighed 21 ounces. J. T.
Highland.

EIGHT hills without fertilizer yielded 46 potatoes weighing 15½ pounds. The largest weighed one pound. M. H.
Sidney.

TWELVE small eyes started in hot-bed, and 35 sprouts planted out June 1; dug

Floricultural.

FLOWER GARDEN NOTES.

W. FALCONER.

SIMPLY because summer has gone and the frost has come and destroyed all tender plants is no excuse why you should leave your garden in a bedraggled and untidy condition. Give it a thorough good tidying up and you will be pleased for doing so all winter long. First of all, with a stout stake or label driven well into the ground beside them, mark the places of fraxinella, lilies, creeping milkweed (Euphorbia corollata), pleurisy root (Asclepias tuberosa), gypsophila, Large-flowering Bell-flower (Platycodon) and other plants that die down into the ground out of sight. This serves as a safeguard against digging them up or injuring them in digging in spring.

Then look after all the tender plants. If they are hardy enough to live out-of-doors under a little mulch covering, all right; leave them there and delay mulching them over about as late as you do your strawberries: that is, until immediately before you expect severe weather to set in. And if you have any plants that really are not hardy enough to survive the winters in the borders; for instance, hybrid pentstemons, montbretias, the finer tritomas, Verbena venosa, Salvia Pitcheri, and the like, lift them at once and plant them in a cold-frame set up in a warm, sunny place; or, failing a frame, lift and plant them in pots or boxes and winter them in a cool room or cellar. And cut over the old stalks of pæonias, larkspurs, phloxes, sunflowers, and other tall-growing perennials and clear them all away.

You will probably find the borders freely scattered over with innumerable seedlings of larkspur, fox-gloves, Sweet Williams, coreopsis, gaillardias and others. Now, no matter whether you want any of these or not, let them alone till next spring; but if there are any large, rough things among them, which you don't want, weed them out, and pull out weeds of all kinds. Then over all the ground scatter a good dressing of well-broken up rotted manure and leave it there till spring. This fertilizes the land and protects not only the young plants, but also the crowns of the old ones, and it saves them all from heaving by frost, and field mice do not like burrowing among rotted manure. Of course, in the case of hollyhocks, Sweet Williams and foxgloves, additional protection over-winter should be given; some dry tree leaves, leafy evergreen branches, dry ferns, sea thatch or the like spread over them will supply this want.

It may occur to many that this is a good time of year to dig over borders in which perennials are grown, also a capital time to lift, divide and transplant perennials, but, really, it is a bad time for any of these operations. The plants now are going to rest and should not be disturbed. Even hardy plants are much hardier when they are firmly rooted and well established in the ground than when they are newly transplanted, and freshly planted plants at this time of year or plants in freshly dug ground are always apt to be heaved out of the earth in winter and often injured. It is always best to lift, divide and replant perennials just before they are about to start again into full growth, or before they have finished their season's growth, or in the case of bulbous or tuberous plants, while they are dormant, or, in the event of early-spring-blooming plants, like trilliums, moss pink, arabis, etc., in late summer in time to give them a firm root-hold before winter.

You can plant out hardy bulbs, like snowdrops, crocuses, squills, poet's narcissus, and daffodils, hyacinths and tulips, just as late as the bulbs keep plump and sound and the ground is open from frost; but, at the same time, the sooner the bulbs are planted now the better they will bloom in spring. There is an opinion common among the people that the lawn should have a good, rough beard of grass on it over winter and that this will preserve the grass roots from getting winter-killed; but this is contrary to my experience. If your lawn is in this condition, mow it over with the scythe while the dew is on it, and rake off the mowings. The lawn will now look clean and pretty, and will not gather and hold in tussocks the tree leaves as they blow about and there will be no dead grass to rake out of it in spring before it can be mown. And in spring, instead of the young grass coming up weak and spindly among the rough beard of old grass, it will thicken itself to begin with.

I have no patience with the people who cry out against mulching lawns with short manure over-winter; they urge two excuses, namely, the unsightliness of the top-dressing and the unsavory odor arising from it. The top-dressing is of decided advantage to the lawn; it protects the turf from the vicissitudes of winter, enriches the land and lays the foundation of a surface coating of rich, spongy material in which short grass revels. As regards the bad smell, no sane man would use rank, ill-smelling manure, when well-rotted

barn-yard manure can be had, and this has very little bad odor, and when previously composted with loam no perceptible smell. Besides, after the first rain or snow-storm any ill odor it might before have had is washed out of it. I top-dress acres upon acres of our lawns with short manure every year and I am positively convinced that these dressings are of immense immediate and lasting benefit to the lawns.

Woman's Work.

CONDUCTED BY EMILY LOUISE TAPLIN.

CHAT BY THE WAY.

MARION HARLAND SAYS: "I would guard one point jealously. Rightly filled, there is enough in the sphere of wife, housekeeper and mother to satisfy any woman, whatever may be her aspirations. Of all forms of whining sentimentality I have least patience with the cry for a higher mission than that of home-making and child-rearing. As the sum of over 30 years' observation of this form of intellectual unrest and the perusal of hundreds of letters from malcontents, I assert, without fear of contradiction, that the unfortunates who raise the lamentations are in the proportion of a thousand to one, and they are those who are the least fit to take the lowest seat in the woman's kingdom."

Brave, sensible words are these; we commend them to the many girls who, troubled with vague aspirations, think "the trivial round, the daily task" too mean and paltry for their hopes and desires. Home life, with its loving sacrifices and simple virtues, is the sphere every really womanly woman should hope for. But, alas! there are plenty of lonely women to whom real home life is an impossibility, though they may contrive some resemblance to it. Let the women who have homes be doubly grateful for their good fortune.

* * *

DEMOREST'S MONTHLY has something to say about the care of the feet, which will give comfort to a good many sufferers. The writer remarks that women whose feet have become misshapen from excessively narrow boots can do much to remedy the difficulty by care and pains. Select easy, roomy shoes, and stockings of soft fabrics. Bathe the feet thoroughly in water comfortably warm, never allowing it to grow cold enough to feel chilly, and wipe them thoroughly dry with a soft towel—coarse crash is almost poison to sensitive skins. and often causes irritation and a small eruption like rash. Then rub into them thoroughly about the joints or injured parts, either cold cream, or, what is better, glycerine, perfectly pure and mixed with double the quantity of water. Especially should it be diligently applied to the joints of the great toes if they are enlarged or painful. Wipe off with a damp cloth and dry carefully, after which powder the feet thoroughly with rice-flour powder. Brush off all that comes away easily and put on the stocking, being careful that no semblance of a seam comes over the sensitive joints. Adjust the shoe carefully—never "jump into" any article of wearing apparel—smooth the boot over the foot and ankle if it is a high top, and be certain that it is comfortable.

These cautions may seem trifles, but the feet are ill, and all conditions of recovery must be observed. Take care that they do not become very cold or in the least damp. The ankle should also be protected by gaiters or leggins, if there is any necessity for going out in wet weather. The difficulty is an inflammation of the joint membranes, and has had many serious results. At night the feet may be wiped off with a damp cloth, and the glycerine and powder repeated. Ladies who adopt this plan, will never find soft corns coming between the toes.

For hard corns there is nothing better than a little judiciously applied caustic, which should just touch the hardened part of the corn, never the surrounding flesh. Repeat every other day, first soaking the feet in warm water, and gently scraping the surface of the corn until it will finally come out altogether. Great care must be taken to keep the caustic from the whole flesh, and the foot should never be damp, as the application will spread rapidly. Such a course of treatment, persisted in, has in several cases restored to quite passable shape and comfort, feet that were considered hopelessly deformed.

THE foregoing suggests a kindred subject, the care of the feet. The New York Sun says that of course every lady keeps her hands clean, and it is hardly necessary to mention that perfect cleanliness is the first requisite to a soft and white hand. This cleanliness is only brought about by two or three daily scrubbings with a brush and with the vigor usually applied to remove the grime from the little fist of the proverbially dirty small boy. No matter how dainty may be your occupation, the water used should be warm, not hot, and the soap be generous in quantity and purest of the pure in quality. There are several efficacious remedies for whitening the hands used by their advocates and inventors. One is the use of lemon juice and glycerine: another which is very highly recommended, is Indian meal and glycerine; and still another is the country girl's lotion, sour buttermilk, whose acid removes stain and sunburn, and whose oil is peculiarly beneficial in making the skin soft and smooth. Any preparation used at night is more efficacious if kid gloves are worn, and perhaps no wiser and less harmful process can be suggested than the careful cleansing through the day with warm water and Castile soap and the application at night of rose water and glycerine covered with kid or rubber gloves.

Handsome nails, which display a crescent of white at the base and a delicate pink tint throughout, are as much a gift as the poet's genius or the artist's skill, but one visit to the manicure will enable you to see how even the most ugly ones may be attractive and pleasing if nice care is taken to trim away the rough skin at the base, which should never be done without first soaking them in warm water, to file the edges in a smooth curve, following the outlines of the finger tip, and to polish the surface every day. Probably an hour each week devoted to the care of the nails, with a little time spent each day in polishing and cleaning them carefully, will keep them in nice order, and they should never be cleaned with any kind of a sharp instrument, as that roughens the surface so that they retain the dust which drifts under them.

It is said by "salesladies" in glove stores that a lady who can wear a No. 5 glove is as unusual as one who wears a No. 12 shoe, and that a large hand looks better, smaller gloved in a mousquetaire of undressed kid, because of the loose folds about the wrist, and that tight sleeves are as unbecoming to a large hand, whether gloved or ungloved, as low heels to a long foot.

GOLDEN GRAINS.

IT seems to me, says George Eliot, we can never give up longing and wishing while we are thoroughly alive. There are certain things we feel to be beautiful and good, and we must hunger after them.....

OUR times of greatest pleasure are when we have won some higher peak of difficulty, trodden under foot some evil, and felt day by day so sure a growth of moral strength within us that we cannot conceive of an end of growth.....

RUSKIN says that all true science begins in the love, not the dissection of your fellow-creatures; and it ends in the love, not in the analysis of God.....

BROODING over real sorrows and imaginary miseries says the Christian at Work, will make the best of us moody and wretched. Nursing grief and affronts and telling the sad stories of our woes have as depressing an effect as narcotic drugs. Sleeping in unventilated rooms often produces chronic wretchedness, even if these rooms are furnished with the appliances of wealth and refinement. Association with grim persons is depressing and dispiriting. Good health, mental, spiritual, and bodily, is worth working for. It casts out the malaria of moodiness and lifts us into the sunlight of joy.....

HAVE you never stood by some arm of the sea which penetrates far inland, and seen its emptiness and ugliness? asks George Harris. There is only the oozy, miry bed of the creek; the blue line of ocean is far away on the horizon. There is no human power by which it can be filled with water. The little streams from the hillsides could never fill the thousand empty indentations in our coast. But the great unquiet ocean begins to creep in. It spreads slowly over the flat bottom, and winds into every bend of the shore, and fills every crevice of the rocks; it covers the long grasses, it drives you back step by step; it surges in, lifting itself with quiet strength, until the little gulf is filled to the brim, and the bowing billows come over the surface, and the ships are lifted from their beds and sail away to their appointed havens The inlet is full; it is filled with all the fullness of the ocean, and with its mighty power. So we are empty till we are filled with the power of God. The toils and sacrifices and duties of life seem too heavy for us; but when inspirations from God begin to come in upon us, when His love rises in our hearts, with His grace and inexhaustible power behind it, we can carry all burdens buoyant upon such a strength, and can feel an undercurrent of Divine Power filling our hearts.....

I SEE the course of my life, said Thoreau, like some retired road, wind on without obstruction into a country maze. I am attired for the future so, as the sun setting presumes all men at leisure and in contemplative mood, and am thankful that it is thus presented blank and indistinct.....

IF rivers come out of their prison thus bright and immortal, shall not I, too, renew my spring life with joy and hope? Have I no hopes to sparkle on the surface of life's current? It is worth while to have our faith revived by seeing where a river swells and eddies about a half-buried rock.

MEASURE your health by your sympathy with morning and spring. If there is no response in you to the awakening of nature, if the prospect of an early morning walk does not banish sleep; if the warble of the first bluebird does not thrill you, know that the morning and spring of your life are past. Thus you may feel your pulse.....

Domestic Economy

CONDUCTED BY MRS. AGNES E. M. CARMAN.

"Unless we act in the living present,
There is naught that we can save;
The future is not ours for labor,
Though our hearts be e'er so brave."

EXTRACTS FROM SUNDAY EVENING TALKS AT THE RURAL GROUNDS.

THE DIFFICULTY OF BEING ABSOLUTELY SINCERE.

DOWNRIGHT SINCERITY, candor, strict integrity are rarely met with. Every one of us, every day, has occasion to feel that he was not quite true to himself. "I am glad to have met you"—"I am happy to make your acquaintance"—"I hope to have the pleasure of seeing you again," are usually uttered without *any* of the feeling which the words imply.

We listen to a shockingly stale or pointless anecdote and laugh heartily "when the laugh comes in." *Is that candor?* I have on a hundred occasions laughed at jokes which I didn't see through at all, rather than display my ignorance of the points involved. Yes, my dears, I have had frequent occasion to blush over this insincerity.

"Favor us with a song, Miss De Jingle." "Oh, I sing wretchedly and am not at all in practice."

"Oh, you sing enchantingly, Miss De Jingle." "Oh, dear, no. I only squeak a little for my own entertainment." Both were uncandid. Both uttered baby falsehoods.

"Now, how old would you take me to be, Mr. Bosh?" "Let me see—30? What *is* your age?" "I am 48." "You don't say so? You certainly do not look to be one day over 30." On his way home Mr. Bosh remarks to his friend: "Did you notice how I tickled the old maid?"

"Come and see us again and stay longer," often means: "Delay your next visit and don't stay so long."

"We have enjoyed your visit exceedingly," means, oftentimes: "We are glad it has come to a close." The financial world is alive with these petty deceits. Sincerity is rarely known in the diplomatic circles of governments, while in the court circles of European society it is a matter of constant study which shall most glibly rattle off these evidences of a courteous and mannerly insincerity. As the world becomes enlightened, think you we are drawing any closer to the simple manners of the lowly Christ?

* * *

YOU may as well have a diamond set in your nose as to have it fixed in your pierced ears. There is no difference except it may interfere with the use of your handkerchief.

Ask yourself this question and *answer* it too: Why do you desire to wear diamonds? Do they make you handsomer? Fix yourself up as nicely as you can, will a diamond on your finger make you handsomer? Why do you place it there? Why do you wear diamond finger rings, diamond ear-rings, diamond pins? Do others love you more for doing so? Do they respect you more? Why do you wear them? Are you happier for thus exhibiting your wealth? Is it as a mark of wealth that you feel gratified to wear diamonds? Does it soothe you to be able to say: "I have diamonds, you have none." "I am wealthier than you?" Do wealthy people who have lots of diamonds respect you or love you more because you, too, have lots of diamonds? Does it please the one or the other to learn that his diamonds are the less or the more valuable? Do poor, worthy people *honor* and love you more when they see you in your glittering jewels?

Who is benefited by diamonds? They represent just so much capital that is lying idle, which might be put to noble uses.

When I was young, diamonds charmed me. I felt a degree of importance *with* my diamonds, that I did *not* feel without them. I felt that strangers *judged* me in a measure by my diamonds. "He must have money;" "He must be a young fellow of some importance," I fancied they said. And, pray, what good did that do? If afterwards they discovered I was worth at the outset but two or three thousand dollars they might well have said: "That young man has more diamonds than brains." Wealthy people who are purse-proud are the most unlovable, repulsive class of people in the world. It is just they who delight in diamonds. From this point of view and coming back to my text, it may be asked if the wearing of diamonds is not an act of wickedness, inasmuch as they are *not* worn from any high or commendable motive; while they hold millions of capital that might be invested to do great good.

* * *

A HERO or heroine is one who explores the darkest places; who imperils his life in the attempt to rescue others or to accomplish some noble purpose, and the nobility of the act is measured by *the degree of danger* or exposure. There are too many who desire to know how to swim without ever going near the water. There are too many of us who wear our virtue as the Irishman paraded the mutilation of his ear which was pierced by a bullet as he was running away, panic-stricken, from the enemy. "Yes, sur, I larst that ear in sarvin' me counthry."

* * *

ONE thing which should make all people, who live to do good, grieve, is the social relations which generally exist a few years after marriage as compared with those which existed during the *wooing* and *honeymoon*. There are many exceptions. We are considering the rule. There is no more lovely, enchanting sight than the love and respect which we occasionally see between man and wife in old age. They tell of purity, chastity, patience, frugality—in short, they tell of all that God loves in his children. "Well done thou good servants" may fittingly be said of them.

* * *

THERE need be little doubt, friends, that when we meet in that other world there will be intense surprise to find that many of us who deem ourselves entitled to the orchestra chairs or private boxes will find that obscure seats are reserved for us *in the pit*—for that great drama of "Eternal Life" where each shall be judged by the exquisitely impartial wisdom of the Divine heart and mind.

THINK OVER.

ENJOY your children.

Girls and boys, cultivate stick-to-itiveness.

Miscellaneous Advertising.

When Baby was sick, we gave her Castoria,
When she was a Child, she cried for Castoria,
When she became Miss, she clung to Castoria,
When she had Children, she gave them Castoria

Be frank; be true; be happy!

TIME for study for both young and old.

VOW that, should health and life be spared you, you will know more about *something* by the first of next May than you do now.

ENTERTAINING THE BABY.

MARY WAGER-FISHER.

AS I was riding in a railway coach between New York and Philadelphia not long ago, I noticed, as I often had before, a baby traveler and the perpetual distractions to which it was subjected by the woman—presumably its mother—who had it in charge. The child was possibly one year old, and when its attention was not being directed to objects outside the car, it was nudged, and poked, danced up and down, fed with knick-knacks and so pestered with what was designed to be diverting, as to weary an onlooker, to say nothing of the effect upon the nervous organization of the child itself. Unquestionably, in no other country in the world do young children receive the amount of coddling they do in this, and of all people we are the most nervous and restless. How much the lack of a quiet, undistracted babyhood has to do with this, may be left to individual opinion. But it is reasonable to suppose that a child left to its own self for amusement, its mental faculties being allowed to develop slowly and naturally, its infancy in brief passing in the most uneventful manner without excitement of any kind, must develop into an adult of far more physical and nervous endurance than the child subjected to what may fittingly be called the forcing process. Mental alertness is a valuable quality; but there is a certain commonplace sturdiness that is not at all brilliant, but which is indispensable to prolonged self-maintenance.

The quiet way in which English and German children are reared is very different from the American plan, and the outcome is equally different. Our women have a delicacy of organization, an unabashedness, and a quickness in repartee, that are both exquisite and startling, while our men have a push and "go" that to the Old World folk seem phenomenal. Surely we are not a nation of plodders, but if it were not for the continuous intermixture of the "plodding" element, the saving salt of imported slow-going-ness, would we not in due time become a nation of nervous "drive-ahead" lunatics? I remember meeting a little girl betwixt seas, who was making her *fourth* trip across this continent, and she had reached the mature age of 18 months. The alertness and intelligence of the child were remarkable, and her American parents were very proud of her achievements. She was pale, restless, bright-eyed—enough to give one a heart-ache and to predict an early grave or an insane asylum as her ultimate station. And she has her counterpart sisters the "States" over, babies tender in years, but old in experience, babbling of fashions and plays, of the cities they have seen—never of the quiet fields and meadows—of party gowns and dances, of the times they have been out of bed until midnight, of the money spent in confections—a hot-house existence that has crept even into the remote villages of the country, so that to see a little old-fashioned child, round and rosy, that sleeps 12 hours out of the 24, lives on bread and milk, and who has experienced nothing more exciting than the slow jog of the family horse, never says anything "smart" nor anything committed to memory to "show off" on occasions, is a grateful relief to the mind. It yields a restful sense as of a growing oak that in years to come will be a source of strength and security.

THE BLUNDER BOX.

PUT a pasteboard box with a slot in the cover in an accessible part of the house for receiving slips of paper upon which are written grammatical errors made by the different members of the family—it is well also to include slang. Each member is to write down the mistakes that he or she hears with the maker's name attached. The box is left undisturbed for a week. At the end of that time let the family assemble. Appoint some one to open the box and read the "blunders." As he or she reads, the member whose name is attached to the slip corrects the mistake and gives the reason for doing so.

It is a capital brake on careless speech. Try it.

HUSK BEDS.

IN a late RURAL I noticed an item in regard to husk beds, and wish to urge all who use straw for beds to try at least one bed made of corn-husks. I am sure they will be repaid. The husks make a soft bed and one which is always light and easily stirred, never becoming matted, like straw. They are also durable and cleanly. Place the husks—or part of them—on the table. Use only the inner husks. Take a few at a time and cut off both ends, using a pair of sharp shears. With the "husking-pin," or an old-fashioned, two-tined fork, split them in strips not more than an inch wide. Drop the refuse in your lap, and the prepared husks in a large basket at your side. This is not so tiresome a task as it seems, and even the little children can help. Every fall the old husks should be emptied out on sheets spread out-of-doors, and left to air in the sun. With the addition of a few new ones, the bed is as good as new.

MRS. LEVI NILES.

OUR boy was a kicker. We knew that an ounce of prevention would be worth pounds of cure if we could only prevent his catching cold at night from kicking off the blankets. We had tried unsuccessfully pinning and tying the blankets down. Finally we found our ounce of prevention in the form of a bag. It was made of soft flannel, quite wide, of good length and secured to his night clothing at the waist. The confinement was so slight that he did not object and there was enough warmth in the flannel to prevent the little limbs and feet from becoming chilled even did he succeed in throwing off his blanket.

GRAHAM GEMS AS MADE AT THE RURAL GROUNDS.

THREE cups of milk—when milk is scarce we use half water—two well-beaten eggs, a little salt, four cups of Graham flour and two full tea-spoons of baking powder. Beat all together. Have a hot oven. Grease the gem pans and place in the oven until hot. Dip in the mixture and put into the oven at once. The success or failure of these gems depends largely upon the temperature of the oven.

GRANDMAMMA Carman's baking powder biscuits are hard to beat. We have always thought that in connection with her good ingredients and the "quick" oven, her swift manipulation of the dough after adding the wetting went far towards insuring her unvarying success.

We remember a pleasant picture of Grandpapa and Grandmamma in the kitchen "at the farm." Grandmamma had just started to make the favorite biscuits while Grandpapa sat close by, watch in hand, timing her. When the biscuits were placed upon the tea-table he announced with pardonable pride that it had then been just *thirteen minutes* since "Mammie" had started to make those biscuits and then asked in a challenging tone, if we younger cooks could beat that!

When You Know

That scores of people have been cured of Boils, Carbuncles, and Scrofulous Sores by the use of

Ayer's Sarsaparilla

why not try it yourself? As a blood-purifier, this medicine has no equal. Listen to good advice: Take Ayer's Sarsaparilla, and no other.

"I had numbers of carbuncles on my neck and back, with swellings in my armpits, and was tormented with pain almost beyond endurance. All means of relief to which I resorted failed until I began to use Ayer's Sarsaparilla. One bottle of this remedy restored me to health."—S. Carter, Nashville, Tennessee.

Ayer's Sarsaparilla,

Prepared by Dr. J. C. Ayer & Co., Lowell, Mass.

Price $1; six, $5. Worth $5 a bottle.

For a DISORDERED LIVER Try BEECHAM'S PILLS. 25cts. a Box. OF ALL DRUGGISTS.

W. R. & CO'S IMPROVED BUTTER COLOR

IF YOU REALLY WISH to use the very best Butter Color ever made; one that never turns rancid, always gives a bright, natural color, and will not color the buttermilk, ask for *Wells, Richardson & Co's*, and take no other. Sold everywhere.

More of It Used than of all other makes combined. Send for our valuable circulars. WELLS, RICHARDSON & Co., Burlington, Vt.

MASON & HAMLIN ORGANS

The Cabinet Organ was introduced in its present form by Mason & Hamlin in 1861. Other makers followed in the manufacture of these instruments, but the Mason & Hamlin Organs have always maintained their supremacy as the best in the world.

Mason & Hamlin offer, as demonstration of the unequalled excellence of their organs, the fact that at all of the great World's Exhibitions, since and including that of Paris, 1867, in competition with best makers, of all countries, they have invariably taken the highest honors. Illustrated catalogues free. $22 to $900

Mason & Hamlin do not hesitate to make the extraordinary claim for their Pianos, that they are superior to all others. They recognize the high excellence achieved by other leading makers in the art of piano building, but still claim superiority. This they attribute solely to the remarkable improvement introduced by them in the year 1882, and now known as the "MASON & HAMLIN PIANO STRINGER," by the use of which is secured the greatest possible purity and refinement of tone, together with greatly increased capacity GRAND & UPRIGHT, for standing in tune and other important advantages.

A circular, containing testimonials from three hundred purchasers, musicians, and tuners, sent, together with descriptive catalogue, to any applicant.

Pianos and Organs sold for cash or easy payments; also rented.

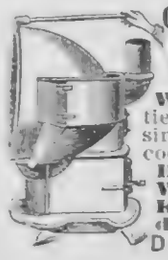
SALESMEN WANTED AT ONCE.—A few good men to sell our goods by sample to the wholesale and retail trade. We are the largest manufacturers in our line in the world. Liberal salary paid. Permanent position. Money advanced for wages, advertising, etc. For full terms address, Centennial Mfg. Co., Chicago, Ill., or Cincinnati, O.

CATARRH HAY FEVER CATARRHAL DEAFNESS

A NEW TREATMENT.

Sufferers are not generally aware that these diseases are contagious, or that they are due to the presence of living parasites in the lining membrane of the nose and eustachian tubes. Microscopic research, however, has proved this to be a fact, and the result of this discovery is that a simple remedy has been discovered which permanently cures the most aggravated cases of these distressing diseases by a few simple applications made (*two weeks apart*) by the patient at home. A pamphlet explaining this new treatment is sent *free* by A. H. DIXON & SON, 337 and 339 West King Street, Toronto, Canada.

GRIND YOUR OWN Bone, Meal, Oyster Shells, Graham Flour & Corn, in the **$5 HAND MILL** (F. Wilson's Patent). 100 per cent. more made in keeping Poultry. Also POWER MILLS and FARM FEED MILLS. Circulars and testimonials sent on application. WILSON BROS. Easton, Pa.



Cook your POTATOES with the **PROFIT FARM BOILER**

With Dumping Caldron, empties its kettle in one minute. The simplest and best arrangement for cooking food for stock. Also make Dairy and Laundry Stoves, Water and Steam Jacket Kettles, Hog Scalders, Caldrons, Etc. Send for circulars.

News of the Week.

HOME NEWS.

SATURDAY, October 26, 1889.

It has just been discovered that under authority of an act of Congress passed in 1866, the President can send "any number" of friendly Indians to settle in the Cherokee Nation until all the land is taken up. It is said that if the Cherokees shall persist in refusing to sell the Cherokee Strip to Uncle Sam on the terms offered, the Commissioners in charge of the matter, in order to bulldoze the recalcitrants, will strongly urge that the Cherokee country should be crammed with a motley swarm of strange aborigines.....Last Monday, at Wilkesbarre, Pa., a lot of Hungarians, "just for fun," fired at a passing 12-year-old boy, and fatally wounded him. They are now in jail for the joke. In their own country these ruffians would be shot down like the dogs they are, by soldiers for such an atrocity. Unless they receive exemplary punishment here Gatling guns will be soon needed to prevent them from giving vent to their brutal nature. Very little of the vaunted Magyar chivalry comes to these shores; but we get by far too much Magyar ignorance, dirt and brutality.....Last Tuesday was selected by the Adventists of Screamersville, Pa., for the "crack of doom," and they put on their "ascension robes;" but there wasn't a "crack." A lot of other Adventists selected Friday, October 25, for the "Day of Wrath," and undisturbed by the failure of their co-religionists' expectations, got ready for flight into the "unknowable;" but not a toot of the Archangel's trumpet was heard. All parties clung to their property, however, right along; not a neighbor got a chance of a bargain at a cent less than any article was worth even when the end of the world was expected next day.....Letter-carriers throughout the country are contributing $2 apiece toward a monument to their warm Congressional friend, the late Hon. "Sunset" Cox.....

After eight weeks and one day, a jury for the trial of the accused "Cronin murderers" was completed at Chicago last Tuesday. By the official count 1,115 jurymen were examined and 975 were excused on one plea or another, no fewer than 175 were challenged—97 by the defence and 78 by the prosecution. With one exception every accepted juror was born in the United States, the exception being an Englishman; and with two exceptions all had American parents. All are Protestants. The jury is said to be a representative American one, and the members appear to be an intelligent and fair-minded body. The trial, which will probably last till about Christmas, began last Thursday. Sixteen indictments have been found against persons accused of having attempted to "fix" the Cronin jury in favor of the defendants. There's little moral doubt that Alexander Sullivan was the prime mover in the conspiracy; but legal proof is still wanted. "Alec" is a long-headed, shrewd, secretive fellow, with a mighty smart wife. He was tried for a cold-blooded murder a few years ago, and escaped, 'tis said, by getting the jury "fixed."

Hearty!

The laborious and expensive efforts to establish a footing in popular regard, for a worthy commodity, are often indirectly supplemented by gratuitous testimony.

When the genuineness of such tribute cannot be doubted, its influence exceeds in importance the costly repetitions of the most judicious advertising.

In the science and art department of the Harrisburg (Pa.) Church Advocate, April 11, 1888, may be found the following unsolicited endorsement of DRS. STARKEY & PALEN'S Compound Oxygen Treatment.

"In some experiments with ozone as a curative agent, an English lady, so far advanced in consumption that her case appeared hopeless, has been treated with inhalation of this gas, with results described as marvelous. After a month's treatment the appetite was regained, the sleep calm and refreshing, and there was a very good prospect of recovery. The ozone was prepared by passing a stream of Oxygen through the current of an induction coil, and was administered with atmospheric air in the proportion of 1 to 5. The experimenter has reached the conclusion that the ozone treatment is specially applicable to all germ diseases."

This instance needs no comment.

Send for the brochure of 200 pages, containing the history of Compound Oxygen. It will be forwarded free of charge to any one addressing DRS. STARKEY & PALEN, 1529 Arch St., Philadelphia, Pa., or 331 Montgomery street, San Francisco, Cal.—*Adv.*

FOREIGN NEWS.

SATURDAY, October 26, 1889.

NEWS from Japan tells of 685 cases of death and 121 of serious injuries during the floods of September 17. Over 1,000 houses were swept away and thousands of acres of crops destroyed. Incomplete returns show that during 1889 72 perfectures have been devastated, 2,419 people killed, 155 wounded and over 90,000 people deprived of means of subsistence. More than 50,000 houses have been swept away or submerged, 150,000 acres of crops destroyed, about 6,000 bridges washed away and some hundreds of miles of road broken up. In proportion to its area and population Japan has fared much worse even than China.....King Louis of Portugal, a good man weighing 250 pounds, and in appearance not unlike ex-president Cleveland, died at the age of 57, on October 19, at Lisbon, with all his family around his bedside. His eldest son, the Duke of Brazanza, aged 25, has succeeded him under the title of Carlos I. He was married on May 25, 1886 to the Princess Amelie of Orleans, daughter of the Compte de Paris, the Royalist claimant of the throne of France. The new king is smart, well educated, a fair painter and "the best shot in Portugal."..... "Reliable information" from Emin Pasha and Henry M. Stanley is to the effect that they will both, together with several other white African travelers and adventurers, reach the eastern coast of the Dark Continent in the latter part of next month. A world of information and misinformation badly mixed has been given with regard to Stanley and Emin, too, on "reliable information."".....Cordite is the name of a new smokeless powder equally fit for small arms and artillery, lately discovered by Lord Armstrong, in England. Unlike the German "smokeless" explosive, this is absolutely smokeless, and the deadly fumes arising from the former are absent in "cordite." Smokeless powder is absolutely necessary with quick-firing guns, as with the smoke-making kinds the gunners would be suffocated in clouds too dense to allow them to see the enemy.....The Sultan of Zanzibar has promised that all the children born in his dominions after January 1 next, shall be free. This is considered a great concession by ordinary folks; but anti-slavery fanatics insist that the despot should at once free all slaves big and little.....Chili has passed a law to go into effect on January 1, abolishing import duties on agricultural tools and a large number of other articles useful in various industries.....American wild turkeys have been successfully acclimated in large flocks in the forests on the estates of Count Breuner in Austria, on the Danube.....Servia has abolished all her consulships in Germania and entrusted all her consular business—to Austria?—no: to Russia.....

AGRICULTURAL NEWS.

SATURDAY October 26 1889.

AT the Annual Show of the British Dairy Farmers' Association a trial was made of a new churn called the "improved patent churn for churning butter *in vacuo*." It consists of a tinned cylinder of Bessemer steel 2½ feet long, and nine inches in diameter, supported on four flexible legs. It has fixed on top an air pump which exhausts the cylinder after it has been charged with cream, and is worked in a horizontal position; the benefit claimed for it is that no gas is generated, and that the concussion is greater. Owing to an accident, the machine did not fulfill the claims of the inventor, so that other trials may be required

GERRIT S. MILLER, Peterboro, N. Y.

with your name in beautiful type for printing cards, marking linen, books, etc., and our new novelty the Wizard flat rack (stick to glass, wood or any flat surface) sent postpaid with full catalogue for stamps or silver. 6 for $1. Agents wanted. Ingersoll Bros. 45 Fulton St, N.Y. City.

to prove its efficiency.....A movement is on foot to secure the opening of two agricultural schools in Tasmania..... At a New York county fair a novel contest was held between young women to see who could harness, hitch to the wagon, drive a certain distance, unhitch and unharness a horse in the shortest time. Some remarkably quick time is reported..... A Western farmer is reported to have sold 100 bushels of corn for $30, and the cobs for $27. There is quite a demand in some localities for bright, clean cobs, for the manufacture of corn-cob pipes. A lot have been exported to England and they were received with great favor.....A single steamer brought over 4.000 bags of Italian beans into this port this week. This will have a tendency to keep down the price of home-grown beans.....The Egyptian cotton crop which is now being gathered is reported to be yielding very poorly..... The Corn Palace festival at Sioux City, Iowa, was a great success, and was visited by immense crowds. The idea was original with Sioux City, and was designed to show the decorative value of the agricultural and natural products of the upper Missouri River. The cost of the palace was $57,000, and 10,000 bushels of corn were used in its decorations.....Prof. C. V. Riley, who had charge of the agricultural exhibits at the Paris Exposition has recently received the official list of the awards given exhibits under the auspices of the Department of Agriculture. These include five grand prizes, 37 gold medals, 55 silver and 39 bronze medals, besides 38 honorable mentions. This does not include agricultural machinery. In 1878 the exhibit received one grand prize and two gold medals, and others in proportion.....Some large farms are reported from Manitoba. The "Bell Farm" 314 miles west of Winnipeg embraces 100 square miles or 64,000 acres. It is inclosed with a post and wire fence. In some of the fields the furrows are four miles long, a "bout" being a half day's work for a man and team. Another land owner has 11 farms each containing 10,000 acres. The work on these farms is done with military precision..... Walter A. Wood, president of the mower and reaper manufacturing company at Hoosick Falls, N. Y., that bears his name, has won fresh laurels during the past summer at the Paris Exposition. We referred several weeks ago to the degree of success already attained with his straw-binder, which was there exhibited. Mr. Wood has achieved the greatest success ever achieved at a World's Fair by any harvest-machine manufacturer. He has been honored with several decorations of the Legion of Honor, and has also had the degree of LL.D. conferred upon him by Hobart College. He is of New England birth, has always evinced great mechanical genius, and has achieved great successes wherever his harvesting machinery has been exhibited, and has carried off highest honors in the most stubbornly contested trials. His life is an exemplification of the possibilities open to persevering labor in this country. Americans, and especially American farmers, should be proud of such a man.....

Crops & Markets.

SATURDAY, October 26, 1889.

ST. LOUIS reports a stock of 1,811,819 bushels of wheat against 4,089,701 bushels one year ago. Reports from Minneapolis say that that the amount stored in elevators there and in the surrounding country is 10,000,000 bushels less than one year ago. Chicago reports a lighter stock of wheat than they have had for years. Reports from other markets are all in the same tone. The amount of wheat in producers' hands in the winter-wheat belt is no larger than it was one year ago. The exports of wheat have been light, but exports of flour have been heavy.

BUTTER is very slow of sale. Prices are very weak and unusually heavy receipts cause a downward tendency. Fancy creamery is the only grade selling readily. State creamery pails have become unpopular, and are not wanted. Tubs holding 50 to 60 pounds are most in demand.

CHEESE has dropped somewhat in price under heavy receipts and light export demands.

EGGS are a little firmer in price for strictly fresh, as the receipts have fallen off considerably. Other grades show little change.

APPLES are firmer in price, Western lots having fallen off considerably. Good fall varieties fit for table use, Kings and Greenings, are most in demand.

PEARS, if choice sell well, Beurre Bosc bringing highest prices. Sheldon, Anjou and Duchesse also sell well. Kegs holding one-third of a barrel, commonly called "thirds," are the most desirable packages.

GRAPES are plenty and sell slowly. The principal source of supply is Western New York. Concords, Delawares and Catawbas are the principal varieties with a few Niagaras. Five and 10-pound baskets are the favorite packages.

QUINCES have been very scarce and sell well if choice. The Orange is the principal variety.

CRANBERRIES are plenty and the market is very quiet.

EVAPORATED fruits are generally strong, especially apples. Stocks are well cleaned up, and prices are likely to be well sustained. Fifty-pound boxes nicely faced and packed are the favorite packages.

HOPS are very low and dull. This is due mainly to a very light export demand, and the probability of heavy supplies from the Pacific coast. The crop has also been heavier in this State than was anticipated.

POULTRY is on the down grade. Receipts have been very heavy, and stock that is not prime sells very slowly. Fancy stock, well-fattened, and arriving in good order will sell readily at outside quotations. Choice venison is wanted.

POTATOES have come in from the West in large quantities and the supply exceeds the demand. The choicest lots sell readily, but poor stock goes very slowly. The prospect is that prices will not go to either extreme.

ONIONS are somewhat lower, but there is no accumulation of stock, and choice, dry lots rule firm.

CAULIFLOWER is not plenty, and choice is in demand at $5 per barrel.

CELERY is plenty. Long Island sells for 60 to 75 cents per dozen, while western is as low as 20 and 25 cents.

SQUASH from Long Island are plenty. Marrows are worth 75 cents, and Hubbards $1.25 per barrel.

TURNIPS are plenty and of good quality at $1.00 per barrel.

A WET HEN

The man who has invested from three to five dollars in a Rubber Coat, and at his first half hour's experience in a storm finds to his sorrow that it is hardly a better protection than a mosquito netting, not only feels chagrined at being so badly taken in, but also feels if he does not look exactly like

We offer the man who wants service (not style) a garment that will keep him dry in the hardest storm. It is called TOWER'S FISH BRAND "SLICKER," a name familiar to every Cow-boy all over the land. With them the only perfect Wind and Waterproof Coat is "Tower's Fish Brand Slicker."

Ask for the "FISH BRAND" SLICKER and take no other. If your storekeeper does not have the FISH BRAND, send for descriptive catalogue. A. J. TOWER, 20 Simmons St., Boston, Mass.

Send your address on a postal card for further particulars.
LOVELL WASHER CO., Erie, Pa.

Law.

"Every Man is presumed to know the Law. Nine-tenths of all Litigation arises from Ignorance of Law."

NEW YORK GAME LAWS.

S. R. J., Ballston Spa., N. Y.—Will the R. N.-Y. publish a copy of the New York Game Laws as they are in force at the present time?

ANS.—To publish a full *copy* of the Game Laws of this State, with all their verbiage, would occupy by far too much space. The following is a brief but full synopsis of all the laws with amendments down to December 1, 1888, showing the "open season," that is, when game may be lawfully killed in the Empire State:

Deer, August 1 to December 1; moose and fawns in the spotted coat are protected, however. Hounding is prohibited except in Queens and Suffolk Counties during the first 10 days of October, Indians excepted. Crusting of deer prohibited. Ducks, geese and brants, September 1 to May 1; in the waters of Long Island, October 1 to May 1. Night-hunting and the use of artificial lights, pivot or swivel guns or nets prohibited. Use of floating batteries, etc., prohibited. Bough houses and decoys must be within 20 rods from shore, except in Great South Bay west of Smith's Point, Peconic Bay, Shennecock Bay, Lake Ontario, River St. Lawrence and Hudson River below Albany. Shooting from boats prohibited, except on Long Island Sound, Lake Ontario, and the Hudson River below Nyack. Quails, November 1 to January 1. Rabbits and hares, November 1 to February 1. Hunting with ferrets prohibited. Woodcocks, August 1 to January 1; in the counties of Oneida and Delaware, September 1 to January 1. Ruffed grouse and prairie chickens, September 1 to January 1. Snipes and plovers, July 10 to January 1. Rail birds, September 1 to January 1. Netting and snaring grouse and quails prohibited. Squirrels, August 1 to February 1. Eagles and insectivorous birds are protected, except robins and meadow larks, from October 1 to January 1. Nests protected, except those of crows, blackbirds, hawks, sparrows and owls. Sunday shooting prohibited. Salmon trout, April 1 to October 1; in Lake George, May 1 to October 1. California trout, September 1 to May 15. Black bass, Oswego bass and muskallonge, June 1 to January 1, except black bass in Dutchess County and Lake Mahopac, July 1 to January 1; Lake George, July 20 to January 1; bass and muskallonge in the St. Lawrence, Seneca, and Oswego Rivers, Lakes Erie, Ontario and Conesus, and Niagara River above Niagara Falls, May 20 to January 1; black bass in Paradox Lake and Schroon Lake and River, July 1 to January 1. The catching of black and striped bass weighing less than half a pound is prohibited.

RIPARIAN RIGHTS.

S. T. L., New Brunswick, N. J.—A small part of a farm which I have lately acquired abuts on the Raritan River; how can I secure the riparian rights, and what are they?

ANS.—Riparian rights are the rights which a land-owner has in the water adjoining his premises and in the land under that water. If the stream is not navigable he is allowed to use the water or the land in any way which is not inconsistent with the rights of owners whose lands lie above or below or opposite him on the same water. An Act of March 18, 1851, made it lawful for owners of land in New Jersey situated along or upon tide-water to build docks or wharves upon the shore in front of their lands and in any other way to improve the same, and when so built upon or improved, to appropriate the same to their own use exclusively. They may also build beyond the limits of ordinary low water provided it is done in such a manner as not to interfere with the public rights of navigation, upon a license obtained from the Riparian Commissioners. Where the stream is small and does not supply water enough to satisfy the natural wants of the different proprietors living on it, none of the proprietors can use the water for irrigation or manufacturing; but for domestic purposes or for watering stock one proprietor will be entitled to use all the water if necessary. Every person who owns land situated on a stream has the following rights: 1. that it shall flow naturally through his land; 2, that it shall not be diverted from its accustomed channel by any proprietor whose land abuts on it higher up its course; 3, that it shall flow off his land through the land of his neighbor below in its accustomed place and at its usual level. If any farmer shall make any change in the natural flow of a stream to the material injury of any other owner situated upon it, or by interference shall prevent the stream from flowing as it was accustomed to flow, he is responsible for all damages he may occasion. Still a diversion of a stream may be made by a farmer, if it be returned to its natural channel before it leaves his premises. No proceedings on the part of the owner of land abutting on a stream are necessary to acquire these rights. They are inseparably annexed to the soil and go with it.

DEPOSIT ON CONTRACT FOR PURCHASE OF FARM.

S. T. L., Steuben County, N. Y.—A buys a farm of B and pays $250 down, agreeing to pay the remainder at 3 p. m. next day; but he does not get to the appointed place with the money until 5.30 p. m.; can B decline to fulfill the contract for the sale of the property, and are the $250 forfeited?

ANS.—Whether B may legally decline to deliver the property to A, and whether the $250 are forfeited by A depend upon the exact wording of the contract, which is not given by our correspondent. It is not uncommon for one person to pay money to another for the right to purchase property, should he decide to do so, at any time before a given day or hour. If that was the contract in this case. then A has received the value of his payment, B having held the property at his disposal until the hour agreed upon, and A cannot justly claim anything more. If, however, A had agreed to purchase the property, and B had agreed to sell it to him and taken the $250 as part of the purchase money, A's failure to be on hand with the remainder of the money at the appointed time, would not, under any ordinary form of contract, forfeit his right to have the conveyance made to him. When the purchaser pays the purchase money, or a part of it, prematurely, and the vendor refuses to complete the title, the purchaser has in equity a lien on the estate.

MINORS AS HOLDERS OF REAL ESTATE.

P. S., Bath, N. Y.—Can a minor hold real estate in his own name in this State?

ANS.—Certainly, and in every other State in the Union. There are hundreds of thousands of minors in this country who are the owners of real estate. There is no objection whatever to such title. The only difficulty is in the reconveyance if the minor wishes to sell it, as he cannot execute a deed to give a good title until he attains his majority, and it can be alienated before that date only by order of a proper court.

Literary.

BOOK REVIEWS.

THE RAINBOW CALENDAR is the bright and taking title of a little volume by Kate Sanborn containing short selections in poetry and prose for each day of the year, leap years included. Decoration and Independence Days, Thanksgiving, Christmas and other special days are honored with special selections. Each day of the year has a page to itself, though half the number would suffice to contain all the matter given. This seems to be a favorite trick of the book-makers to make a little go a great way. The selections include extracts from Bryant, Browning, Thoreau, Holmes, Longfellow, Josh Billings, Helen Hunt, Hawthorne, Whittier, Burdette, Bayard Taylor, Frances E. Willard, and many others.

Small bits of a poem or story are sometimes very unsatisfactory, but these selections are so skillfully made and so charmingly arranged that they form a combination as bright and cheering as the crescent which gives them their name. Cloth, illuminated; five by seven inches; $1.25. Houghton, Mifflin & Co., Boston.

THE latest collection of Uncle Remus's (Joel Chandler Harris) stories consists of "Daddy Jake, the Runaway," which gives the book its title, "Brother Rabbit's Courtship," and a dozen other negro-folk tales, given in Mr. Harris's inimitable style. Daddy Jake was a spoiled house-servant who got into trouble with the overseer, and thinking that he had killed the white man, fled to the cane-brakes. His master's two children missing "their most agreeable companion" sorely, one day started down the river in an old bateau to find him and bring him home. After drifting for miles the boat got into an eddy near the very cane-brake where the old negro was hidden and they were restored to their distracted mother by the runaway, Daddy Jake. The book is gotten up in fine style, with broad margins and heavy cream paper. The cover has a portrait of Daddy Jake, and also shows the turkey and the rabbit going through a fantastic dance. The illustrations are by Kemble who is unequaled in illustrating this style of literature. Boards; 8½ by 10½ inches; 145 pages; price $1.50. The Century Company, New York.

LITERARY LANDMARKS by Mary E. Burt, Teacher of Literature in Cook County Normal School, Englewood, Illinois, is a small volume by a teacher of many years' experience, intended as a guide in the selection and use of books in and out of the school-room. The author says that it is not because she knows so much of books, but because she knows so little and has spent many years and hundreds of dollars to get a small knowledge of books, where, by taking a direct road, she might have had a much larger knowledge at less expense that she offers the results of her work in the school-room. Diagrams are given outlining plans of reading for children of different grades or ages, but it strikes us that some of the books mentioned are rather heavy reading for children of the specified ages. They certainly would be for those who have enjoyed the advantages of the ordinary country or public school only. Still the book is a welcome addition to this too meager department of literature. There are 152 pages, of which 44 are taken up with a list of books recommended, with their price and publishers, and comments upon them. Four and one-half by seven inches; cloth, 75 cents. Houghton Mifflin & Co., Boston.

THE NEW ELDORADO is an account of a summer trip to Alaska by Maturin M. Ballou, and is a graphic description of a journey to that vast territory of which so little comparatively is known. When the United States purchased this great expanse of ice-bergs, forests, islands and mountains, it was considered a very foolish transaction by many people, but Wm. H. Seward who was chiefly instrumental in consummating its purchase, considered it one of the most important acts of his official life. He said that it might take two generations before the purchase was properly appreciated. Its area is three times that of the Republic of France. So little was the new acquisition appreciated that it was not even granted a territorial government until 1884. Governor Swineford of Alaska says that 20 years ago he made political capital out of Seward's purchase. He called it the refrigerator of the United States. He heaped obloquy on William H. Seward. He now declares that he shall spend the rest of his life in making reparation to what he has so foully wronged. This volume is by a man who has evidently learned to travel to the best advantage. He describes his journey via the Northern Pacific Rail-road, and tells of all the wonderful sights of this great region; tells about the natives of the different parts of Alaska, their customs, religion, manner of life, etc.; the resources of the country in the way of fisheries, furs, mining, agriculture, etc. This book cannot fail to be a great instructor to any thoughtful reader. Five by eight inches; 352 pages; cloth, $1.50. Houghton, Mifflin & Co, Boston.

RURAL POTATO REPORTS.

(*Continued from Page 729.*)

September 19. Yield 113 potatoes, weighing 29 pounds. Largest weighed 13 ounces.
Elyria. C. R. M.

FORTY-FOUR small eyes yielded 37 pounds 13 ounces, trench culture. M. M.
Centre.

PENNSYLVANIA.

THIRTEEN eyes planted April 23, in a trench with potato fertilizer. Flat cultivation. Yield, 46 potatoes, weighing 15 pounds. J. E. W.
New Alexandria.

FIVE eyes planted May 1; soil well fertilized; yield nine pounds 10 ounces.
Girard. MRS. A. B.

TEN eyes planted May 7, in a trench; only six grew. Yield, 20 potatoes of fair size.
Saegerstown. E. A. K.

ONE small potato; yield, 6½ pounds—21 potatoes in all. Fertilized with wood ashes.
Eaton. MRS. H. H.

POTATO weighing 1¼ ounce cut into seven pieces, and received regular field culture. Yield, 23 tubers, weighing eight pounds; all marketable. A. P. A.
Meadville.

SIX pieces planted May 25; four grew. Dug September 24; yield, 13 marketable potatoes, weighing three pounds. Largest weighed six ounces; smallest the size of a hen's egg. MRS. W. D. H.
Beaver Falls.

VIRGINIA.

TEN one-eye pieces planted May 1, seven grew, fertilized with bone phosphate. Dug October 9, yield eight pounds, nice potatoes.
Speedwell. H. M. A.

FIVE hills, fertilized with one pint of hen-manure in each hill, planted April 1. Dug second week in August. Yield nine pounds nice, smooth potatoes with no sign of rot.
Barren Springs. F. C.

FIVE hills blighted early, but yielded 43 tubers weighing 18 pounds; beauties.
Fagg. G. W. B.

THREE eyes in garden soil, no manure, planted July 1. Dug September 26, yield nine tubers, weighing three pounds two ounces. MC A. K.
Winchester.

VERMONT.

POTATO cut to 11 eyes. Planted May 18 in trenches, fertilizer at the rate of 500 pounds per acre above the seed. Dug September 9, yield 16½ pounds. H. L. P.
Williamstown.

POTATO as large as a butternut, yielded seven pounds seven ounces, entirely free from rot though other varieties rotted badly. J. F. B.
Tunbridge.

WISCONSIN.

SEVEN pieces planted April 20, in soil well fertilized with stable manure, and wood ashes. Killed by frost September 18. Dug September 30. Yield 17 pounds of smooth, sound potatoes. J. V. L.
La Crosse.

SIX eyes planted in garden. Dug September 28, yield 39 tubers, weighing 10 pounds 10½ ounces. W. D.
Lynxville.

EIGHT hills planted April 15 in good, deep soil, dug September 21. Yield 77 tubers weighing 29 pounds six ounces, 890 bushels to the acre. A. C. P.
Richland Center.

SEVEN hills yielded 40 potatoes weighing 11 pounds six ounces, dug September 4.
Oconomowoc. MRS. C. H. J.

TWO hills planted May 8, fertilized with rotten manure in the hill. Dug September 28, yield 19 potatoes, largest two weighed 28 ounces. A. J.
Neenah.

WEST VIRGINIA.

TWO SMALL tubers made 34 eyes—planted in pots, reset in field May 15. Dug September 9. Yield 37 pounds. J. D. S.
Wellsburg.

PLANTED April 4, seven eyes. Yield 11 pounds 14 ounces. L. H. W.
Welcome.

WASHINGTON.

I PLANTED seven one-eye pieces in trench eight inches deep with a liberal layer of well-rotted manure under them. I then covered them about three inches, and filled trench when they came up. No other cultivation. I dug 42 potatoes weighing 22 pounds. The largest weighed 17 ounces. Every potato is perfect in form. J. B. A.
Mitchell.

WYOMING TERRITORY.

MY little potato gave six eyes. Cut by frost June 6, bloomed July 15. Killed by frost September 6. Yield 64 potatoes weighing 16 pounds 10 ounces. W. J. S.
Buffalo.

RURAL SPECIAL REPORTS.

Kansas.

IUKA, Pratt County, October 15.—This has been a year of general prosperity in this section. Wheat, oats and corn are all above the average. Almost all vegetables are in abundance. Potatoes are a good average excepting later kinds which will be a very short crop. There is very little rot. We have a large crop of sweet potatoes and the quality can't be excelled by any Jersey potato. Our long, dry spell was broken by a general rain on the 14th and 15th. The acreage of wheat sown this fall is the largest ever put in, and we are sure of a good stand for the ground is thoroughly soaked. All kinds of feed are abundant and cheap. Wheat 50 cents; oats, 10–12 cents; corn 12–14 cents per bushel; hogs, $3.25; cattle (cows and heifers) $1.25–$1.75 per cwt.; potatoes, 45 cents; butter, 12 cents; eggs, 10 cents; chickens, $1.50 and $1.75 per dozen. With an abundance of cane for honey and numbers of cows for milk—surely we are in "the land of milk and honey." J. J. M.

Michigan.

MIDDLEVILLE, Barry County, October 13.—Clover seed is not more than half a crop. The dry weather shortened it; but there is no use in getting discouraged; clover is the only thing to keep life in my land as long as I can get a seed. Wheat did pretty well by measure, but was light in weight; barley was also light. Oats were a fair crop—about 40 bushels to the acre. Potatoes are a fair crop, when planted early.
P. MC M.

PARMA, Jackson County.—Probably there will not be more than a quarter of a crop of clover seed. Corn about half a crop. Wheat a little short. Oats an average crop. Potatoes and all other crops are good on reclaimed low land; but otherwise they are short; but there is enough for culinary purposes generally. Strawberry plants set early got a good start; the first runners rooted but it has been so dry since that not one-fourth of the runners have rooted, which makes scant matted rows. Cattle are depending on fodder as in winter. Fodder is abundant. Grapes half a crop and their value has been diminished by frost. E. B. C.

YPSILANTI, Washtenaw County, October 17.—Clover seed has been a very poor crop for the amount of straw—one bushel to the acre is a fair average. Apples about 60 per cent. of a crop; corn, 55 per cent. The outlook for the coming wheat crop is about 25 per cent. and unless it rain soon there will not be that much. R. S.

New York.

FARMINGTON, Ontario County.—The oat crop in this section was light. Hay, corn and winter wheat were good. Early potatoes are a failure, while later varieties on some farms are much better than was expected. Fruit is scarce and of a very inferior quality. E. A. H.

LE ROY, Genesee County, October 9.—No clover seed is raised in this town nor has there been any for three years. Potatoes are badly blighted—only a half crop. Wheat, barley and oats are very good crops. Beans are good on dry lands. Apples are scarce. The hay crop is very heavy. Prices of all kinds of farm products are low. Wheat on the ground is rather small.

FRAUDS, SNAPS AND HUMBUGS

Are still worked on the people with amazing success; statistics show that there are at least *a hundred suckers born every hour,* who are ready to catch onto every "fraud scheme" that comes along. Among them are those who buy Buggies and Harness from the firms who advertise *something for nothing,* and when they get the good, hard-earned money, they send a cheap, shyster buggy or harness that a man is actually ashamed to hitch his horse in.

The majority, (this leaves out the suckers), of the American people have awakened to the truth, and will now have nothing but the

"MURRAY" BUGGIES AND HARNESS,

which are the Best and Cheapest, and which are more widely recommended than any other, and of which the editor of this paper says:

"THEY WITHOUT DOUBT CAN'T BE BEAT FOR THE MONEY."

A "MURRAY" $5.95 HARNESS.

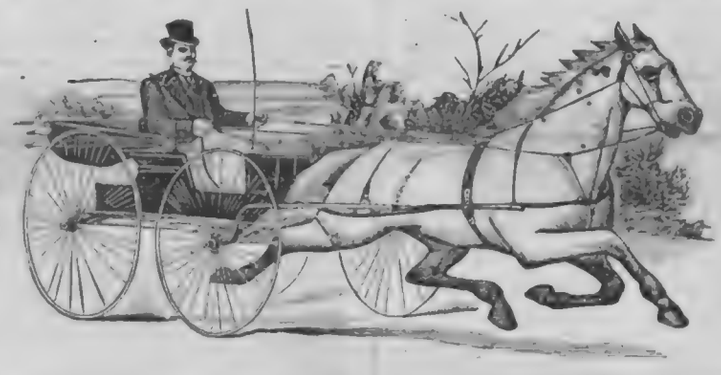
CANTON, N. Y.

To the Wilber H. Murray Mfg. Co.:

Gents—Your Harness received all right and am very much pleased with it, so much so that you can expect my future trade.

Yours truly,

A. M. PIKE.



A "MURRAY" $55.95 BUGGY.

CONESTAGO, PENN.

To The Wilber H. Murray Mfg. Co.:

Gents—The Buggy I ordered from you arrived in good condition, and is very satisfactory. Every one who examines it, pronounces it the best for the money ever brought to our country. I expect to be able to sell a few of them for you in the near future.

Yours truly, *P. C. HILLER.*

We don't give COLD DOLLARS FOR DIMES, neither do we offer unheard of inducements to exhibit or introduce our goods, for the "Murray" Buggies and Harness are too well known for any such work as that. If you want the best goods for the least money, write us for our illustrated catalogue containing full description and plain net cash prices of the "Murray" Buggies and Harness.

A LA MARQUE ROSE, NILES, CALIFORNIA.

THE illustration, Figure 268, is from a photograph of a La Marque Rose on the house of James Shinn, Niles, California. It is budded on a double Cherokee Rose. The Cherokee was planted, a one-year-old rooted cutting, in the spring of 1877. About 1882, the Cherokee being then a large plant, well up to the second-story window, three buds of La Marque were inserted at from four to nine feet from the ground. The top was cut back, and the buds got a start. At present the vine is about one-third Cherokee and two-thirds La Marque. It grows so luxuriantly that it has to be cut away from the house and windows every year. If any attempt had been made to spread it over more space it would easily have covered four or five times as much of the porch; but other roses, a Bigonia grandiflora, clematis, Catalonian Jessamine, and other vines occupy places on the lattice around the house, and the La Marque has to be restrained. There are some roses upon it for 10 months in the year. The heavy bloom is in April and May.

The original Cherokee stock separates into two large stems near the surface of the ground. Each of these is a trifle over 11 inches in circumference. Three or four small Cherokee stems four inches in circumference also ascend from this point. The largest La Marque stem is 12⅛ inches in circumference or larger than the stock. The other two La Marque stems are nearly as large. The union is perfect, and the whole plant is thrifty and vigorous.

Farm Topics.

TWO LETTERS THAT SUIT US.

My father and I are farming together, as in some way I have escaped the attractions and allurements of city life. I scarcely know how, for from my earliest recollection I have had a longing for a mercantile life, a longing which sometimes almost overcomes my resolve to be a thorough and practical farmer. I am 24 years of age, married and living on the farm with my father and mother, under the same roof but as two separate families, the house having been arranged for that purpose. Nearly one year ago the R. N.-Y. was introduced into our home. To say that I have become an interested reader hardly expresses how much I am thankful for the amount of good it has done me. Suffice it to say that I carefully read every issue and thereby am becoming so interested in things relating to the occupation of the farmer that I am nearly forgetting my aspirations toward another kind of business, and right here I believe is one reason why so many of our farmers' sons leave the old farm to seek their fortunes in the cities. One may travel through the country and take the farming class generally and in not more than one home in every 25 or 30 is there to be found an agricultural paper of any description for the boys to read. The older ones are content to plant and sow and jog along in the same old rut year after year, to look for better times and say that "farmin' don't pay" as it used to; but the boys who are coming up will not take the places of their fathers on the farm because they want something new; some variation to the old, old plan, and not finding it they leave home and the city receives them. Now the doctor will take his medical journal, the school teacher his educational paper, the business man his daily paper, the politician his political party paper; but the farmer, where is he with the paper which relates especially to his interest? Let me whisper it! he is "way back" like his picture in some of the city papers. But he says he can't afford an agricultural paper. Now just see: these men can afford to store their lumber wagons in the fence corners and other tools in like places, and then can't afford an investment which will pay 50 per cent. on the money invested! Too thin! I feel like going out and stirring up some of these men and making them take the R. N.-Y. a year on trial, feeling sure that they would continue in well doing when once they were started on the right track. H. S. W.

Little Utica, N. Y.

I am glad to note that it is not proposed to lower the standard of the R. N.-Y. Its success must demonstrate that the farmers of the United States appreciate and will heartily support a journal that is at once an ornament on the table of the wealthy and so dear a friend in the homes of the poor that they cannot afford do do without it. The ranks of cheap farm papers are filled to overflowing now; I am a subscriber to several. There are good papers among them; but the R. N.-Y. is far the cheapest when we take into consideration the feast it places before us. L. H.

Dansville, N. Y.

ANOTHER MICHIGAN THRASHING SCENE.

OUR friend, William Anderson of Alcona

A LA MARQUE ROSE AT NILES, CALIFORNIA. From a Photograph. Fig. 268.

County, Michigan, sent us the photograph, a copy of which is shown at Figure 270. Three or four years ago, Mr. Anderson and 11 of his neighbors formed a company and bought a $600 thrashing machine direct from the makers. The agency fees saved by this transaction amounted to $90. This practical form of co-operation has been successfully carried out. The members of the company pay enough for their thrashing to cover the expenses of running the machine and any possible breakage. Two cents per bushel for fine grain and one cent for coarse have paid all expenses thus far. Our picture shows the machine and the members of the company at work. We frequently hear of plans for co-operation among farmers. Here we have an instance of the success of such a plan. Who doubts that this company does improve the social and neighborly feeling of the community as well as the business affairs of the farmers. Blessed is the farming community where such combinations are possible.

The Vineyard.

A NEW METHOD OF GRAFTING.

I INCLOSE a sketch—see Figure 269—of the way in which Mr. John Cretors of Leavenworth, Kansas, grafts the grape very successfully, commencing not earlier than June 22, on stocks half to three-quarters of an inch in diameter. A slit is cut upwards

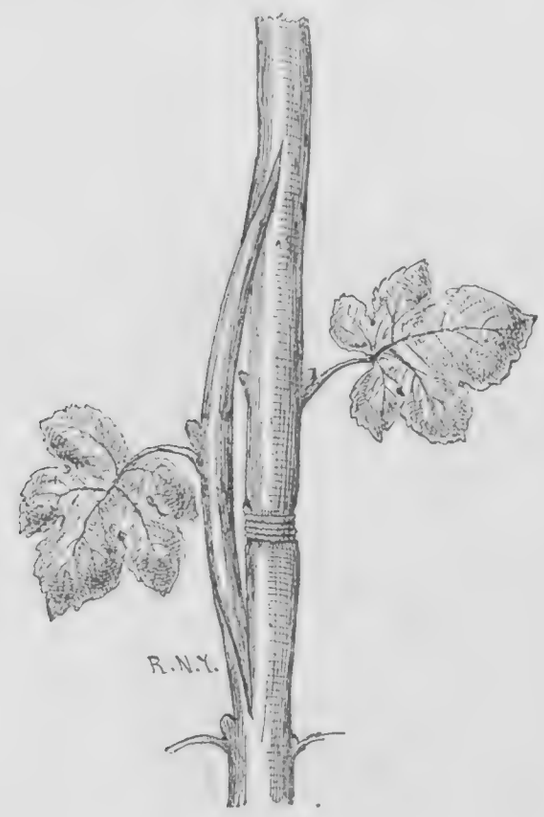

Fig. 269.

and a similar one downwards in the stock at any convenient hight above the ground, and the graft is cut with a bow-like bend which keeps it tightly in place. The grafts are tied with rubber bands a quarter to three-eighths of an inch wide pretty tightly or they are wrapped tightly with tin-foil cut in strips half an inch wide rubbed down closely as the wrapping proceeds, then over the foil they are wrapped tightly with soft cotton wrapping yarn; then the stock between the ends of the graft is tied tightly with hard cord. C. W. K.

Los Gatos, California.

Rural Topics.

Making a Living

ON A

LONG ISLAND LOT OF 12 ACRES;

MOST OF IT IN SCRUB OAKS!

CAN A CITY MAN DO IT?

AS THE R. N.-Y. stated two weeks ago, the following letter was recently received from a man in this city:

"I own a farm of 12 acres, 20 miles out on Long Island. It is average Island land with a small house, etc. Eight acres are Scrub Oak and hazel brush; four are cleared. My family consists of a wife, a father and a mother-in law (too old to work) and three children two to nine years old. I am a real estate broker. At the end of the year in the city I am usually $100 in debt for living expenses, though I work like a slave as most "curb-stone" real estate agents do—to say nothing of the mental strain of getting food and rent for a family. Now does the R. N.-Y. or its readers who are practical farmers think that I could make a living on my 12 acres by working it myself? When young, I had three years' experience on a Western farm. I worked 40 acres of corn all by myself having no help except at topping and husking time and the yield was 85 bushels to the acre. But this was in the West where hand-hoeing was deemed almost a disgrace. What means would the R. N.-Y. recommend as the most economical for clearing those eight acres of Scrub Oak and hazel brush? What crops would be best to give the quickest returns, my cash capital to get utensils etc. being, say, $300? Would poultry raising for eggs or market be advisable?"

THE R. N.-Y. always hesitates to give advice in such a case, because it knows that there is no general rule that can be given. A complete change of business is always a serious matter. Nothing could be more abrupt than a change such as our friend proposes. The whole thing will depend upon the man, and in this case, his family. In any event "a living" can only be secured by practicing the strictest economy, by most hearty co-operation indoors and out, and by the most constant labor and observation. This letter has been referred to some farmers on Long Island, who have for years studied the conditions of farm life there. Their replies are not encouraging, but the R. N.-Y. cannot help feeling that they are far more sensible than those sometimes given by persons who view country life from a distance. The R. N.-Y. will be glad to hear from others regarding this matter. It is particularly anxious to learn if the same conditions prevail in the vicinity of other large cities. Since the above was written the letter from W. D. Pyles has been received. This puts a new face on the matter. It must be remembered that Mr. P. lives in a section where the climate and natural conditions are all more favorable than the would-be Long Island farmer will find them. We shall be glad to hear from others who have gone from the city to the country.

FROM O. A. F.

I can see no way by which this correspondent can make his farm of four acres of cleared land and eight acres of Scrub Oaks of any practical value to him except for a home. He says there is a house on the place and that he can raise $300 in cash. A farm of that size would not require stock, except one horse, and he would have to confine himself to market gardening. But he must have experience first, or very closely watch a neighbor "whom he knows to be successful." It would be better still to work for him a year at $15 per month "going wages," and learn the business. He will make more money by the latter method. Shrewd, experienced farmers are obliged to figure very closely to make their farms support them, and in the majority of cases he will find that the young farmers who are not well forehanded depend on outside work to help them pay their fertilizer bills. A man who is willing to fill in his spare time with team work, such as mowing, trucking, etc., can generally find plenty of work. I should judge that it takes as much intelligence and experience to manage a farm successfully as it does to manage a ship successfully, from the fact that the best farmers dropped corn and the best captains were cabin boys. No amount of explanation would tell a person as much about farming as one month on the farm, or as much about the water as one month before the mast.

Promised Land, N. Y.

FROM A LONG ISLAND FARMER.

In reply to the inquiry as to whether a man can make a living on a 12-acre farm within 20 miles of New York City, I should say it would depend to a great extent upon the man and his family. Tens of thousands of men are living on such farms or garden spots and supporting large families; but these men are living and working in a way in which no American would care to live and work. They work all day in the fields and spend the night on market wagons driving to the city or waiting about the market. For them there is no rest during the busy season; no Sabbath or holiday is recognized. Life is one eternal routine of work and struggle. But the man is not the only slave; his wife and children work with him. It is a common thing to see a whole family working together in a field on a Sunday or holiday; during week days they seem to be at work about all the time, even using lanterns to get the produce ready, after it is too late to work in the field. The houses of these people are of the plainest description, and their interiors are utterly devoid of any ornament or evidence of luxury. They know and care little about education, and as a rule take no agricultural paper. Their food is of the coarsest description. It is safe to say that by far the larger proportion of these farmers (?) or gardeners do not speak the English language. Living as these people do, they can afford to sell their produce at the very low price which it usually brings in the New York market and still have a margin of profit; indeed many of them have saved up large sums of money and have gradually enlarged and improved their lands until they have become relatively independent. Now I take it the inquiry comes from an American who is accustomed to live as Americans do. The very nature of the inquiry shows that the man feels the necessity of "supporting his family." This I should say, without any hesitation, would be an impossibility on a farm or garden of the size mentioned. I should say the net result of a man's or a woman's labor—for women earn almost as much as men—would not be over one dollar per day. This would not begin to support a family.

Pearsalls, N. Y.

FROM DAVID CARLL.

After 40 years' experience in farming on Long Island I cannot conceive any way by which a man could make a comfortable, or even a decent living for himself and family on such a place as is described. If he could work for some of his neighbors or do something by which he could earn money in addition to what he could get off his place, he might "make it go," not otherwise in my opinion. I presume a man in such circumstances could as economically clear up the Scrub Oaks with sheep as in any other way.

Deer Park, L. I.

FROM H. A. BROWN.

I think it about impossible for any city man to support a family of seven on four acres of cleared land and eight of uncleared. It is possible to do so if the man and his father are able-bodied and willing to get right down to hard work and close economy, and can dig the stumps and clear the land all up themselves, provided the land is fair, loamy soil, and there are reasonably good market facilities. It must be remembered that we have to compete with the fast-developing South, with its early productions; with the boundless West, with its ever-increasing products and lowering prices. I honestly and conscientiously believe Long Island to be one of the most healthful and pleasant places on the continent; but there are only three classes that can live successfully on the middle portion of the island, viz., the rich, the practical Eastern farmer, and the very frugal, hard-working poor man, who will live within his income be it ever so small. I believe the cheapest way to clear up scrub land is to dig the scrubs by hand with a mattock. It costs, if hired, from $16 to $30 per acre to stub them. I hardly think more is necessary; but if this man tries farming let him practice after the best farmers near him, or the best of the class who produce what he wishes to grow. I have given a poor German good advice and he is doing well, though he had but $4 when he and his wife came here.

Wyandance.

FROM W. D. PYLES.

On page 680 a man wishes to know if he can make a living on 12 acres of land on Long Island; I do not live on Long Island but will give a little of my experience. I worked for my father on a farm till I was 20 years old; then I worked in Washington City for five years, saving in the mean time $700 and also fracturing my ankle joint so as to render me unable to perform much work that requires a good deal of walking, such as plowing, etc. I went eight miles from Washington, D. C., and bought 15 acres of poor land, paying $1,200 for it—part cash and the rest in yearly installments. That was in '81. There were no buildings of any account. I first bought a pair of horses and one two-horse bed wagon for hauling manure from Washington. I bought strawberry and raspberry plants and set them out and began a fruit and vegetable garden for market. I have the farm paid for and have bought another of 15 acres, and another of nine acres, and all are paid for. I own three fine horses weighing 1,050 to 1,250 pounds each, three head of cattle and raise hogs enough to furnish me with lard and meat each year. I have built a fine dwelling, as well as a bank-barn, a wagon-shed, a corn-house, a blacksmith shop, etc., costing between $2,500 and $3,000 all paid for. Like friend Terry I am a specialist. Strawberries, sweet-potatoes and grass are my special crops. But, unlike him, in regard to butter and milk, I have my own Jersey cow and make my own butter and get my milk pure. I raise all the vegetables my family use, so I have a comparatively small bill at the grocery store. I keep my sweet potatoes till the price rises in winter, sometimes as late as April the following year. I've made all I own except $700, since 1884. I lost money the first two years, and came out even the third. I began to gain in the fourth and am still ahead.

I hire one man by the year and pay him $15, furnishing him a house and fire-wood and vegetables from the garden. He boards himself except breakfast which I give him so as to have him come earlier in the morning. I have a house for a tenant on one of my farms, in which my man and his family live. His family pick berries, etc., which helps him along. I hired my first man in '81. He stayed with me for seven years. Next year will make the second for the present man. I treat my help well and he satisfies me in return. I often let him have a horse and wagon to carry his family to church, camp meeting, etc. If the Long Island correspondent is an economical man I don't see why he cannot do well on his 12 acres. My land has improved till most of it is worth $100 per acre, while I can buy plenty of land near me for $10 to $20 per acre, so I am improving my farm and living as well. There are plenty of men who owned farms when I came here who predicted that I'd stay only two years and "bust;" but I am here yet and away ahead of them. Most of them come to me for advice now instead of ridiculing me as they did at first.

Prince George County, Md.

Dairy Husbandry.

THE QUALITY OF BUTTER

As Affected by Different Grains.

WHAT DAIRYMEN SAY.

SOME months ago Mr. Henry Stewart wrote the following for the R. N.-Y.:

"In my careful and long-continued experiments I have found that foods affect butter in the manner following:

Buckwheat bran—white, crumbly butter.

Linseed-oil meal—soft, oily, flat-flavored.

Bran and middlings, both wheat and rye—light, rather soft.

Corn-meal—firm, yellow, high-flavored.

Cotton-seed-meal—hard, rich-flavored and yellow.

Oats—light, crumbly, poor-flavored.

Peas—yellow, rich, soft."

A number of dairymen have been asked to tell us how far this statement coincides with their own experience. It seems evident that there is room for a good deal of experimenting with these foods. How do some of our dairymen know that they are feeding the most economical butter ration?

FROM J. W. NEWTON.

So far as my experience goes, Henry Stewart is right in his estimates of the effect of grain feeds on the quality of butter; but I think that hay (or its equivalent) as part of the ration has even a more marked effect than grain. In other words, a good hay feed combined with a poor grain feed will make a better quality of butter than a good grain feed combined with poor hay. More prominence should be given to the quality of the butter resulting from different feeds than to the

quantity, and the most economical butter ration is that which produces the most butter of the best quality at the least cost. This is a problem for the stations of the dairy States to work out.

Stowe, Vt.

FROM W. B. PRATT.

I have never fed wheat or buckwheat bran for butter, but have used both in slops when an increased flow of milk was wanted, and have found both good for the purpose of producing it. For making butter in the winter I have added to early-cut and lightly salted hay either clover, Timothy or Orchard Grass and fodder-corn or corn-stover, a daily ration of sliced Golden-Tankard Beets, sprinkled with two to four quarts of corn and oat-meal, in about equal parts of each by bulk. The excellence of corn-meal is questioned by no one; nor have I ever discovered or suspected injury to the quality of the butter from the oat-meal part of the ration. Indeed, in seasons when the oat-bin has been fuller than the corn-crib it has been thought that the larger proportion of oats that entered into the mixture was more satisfactory in its results, possibly because of the better condition of the animal arising from a less concentrated ration. If the color of butter is traceable to the food given, then ought not yellow corn give a more golden hue than white corn? Who shall say that it does? If it is the kind of meal rather than the nature of the animal that determines all other characteristics of butter, then ought not all cows give a like quality of butter from a like sort of feed? Who will say that they do? I have not had experience with many of the sorts of meal mentioned.

Prattsburgh, N. Y.

FROM GEO. M. ORRIS.

I feed mostly bran to my cows in summer and half corn and oat chop with bran in winter, and I know that my butter was higher-flavored last winter than it is now, but I attribute it to the mode of making it more than to the feed. I have been placed in a position requiring me to make my own butter, and I know that there is a great deal to be learned yet in the making of butter and the feeding of cows. I shall try some experiments this winter on this subject and report to the R. N.-Y. I fully agree with Mr. Stewart in regard to buckwheat-bran (shorts) and linseed-meal. I discovered their effects on butter some time ago. I always was in favor of corn-meal for cows in the cooler months of the year; but disliked to feed in summer as the cow seemed to fatten up too much when fed on it in warm weather; but it is a great feed for butter if fed with wheat-bran, pound for pound. I have fed some cotton-seed-meal and it made the milk very rich; so much so, indeed, that I thought the butter tasted oily. I may have fed too much of it. I have never fed any pea-meal to my cows. There is a great difference in the flavor of butter according to the way it is made up, for so many things one comes in contact with damage flavor, such as weather, water, feed, ventilation, too much ripening, poor salt, ill-treatment of cows, etc., so that a dairyman has always to keep his wits about him or he will get left occasionally. Dairying is about as trying a way to make money as one may well get into.

Meadville, Pa.

FROM J. MCLANE SMITH.

My business is furnishing cream, not making butter. I churn only when I have some cream left over. I have never fed pea or cotton-seed-meal or buckwheat-bran, as they are not sold in our market. My usual ration consists of wheat-bran and malt sprouts, with the addition of crushed corn and a small amount of linseed-meal in winter. These in our market afford the proper nutriment at the least cost. But I have never fed the ingredients separately to note the effect.

Dayton, O.

FROM H. S. WEEKS.

As my farm has for many years been devoted almost exclusively to the production of cream for hotel use, I have not experimented much in feeding for butter; but I have used all of the feeds mentioned by Mr. Stewart, except cotton-seed-meal and peas, and find none that will take the place of corn-meal as a part of the ration in making rich, heavy cream, though if silage from well matured corn along with some of the other foods named be used, my own experience is that equally good results will be obtained, and my custom is now to feed bran and middlings with silage, and when the cows are at pasture or on green feed, to add corn-meal or corn and oats ground together in the proportion of one-third in weight.

Oconomowoc, Wis.

FROM F. D. DOUGLAS.

I have had little experience with any one of the various kinds of feed named, when used alone, as a grain ration for milch cows, because of the fact that neither alone makes a well-balanced ration, while all, with the exception of buckwheat-bran, are valuable as constituents of judiciously constituted rations. The results of Mr. Stewart's experiments were substantially as I should have expected. From my previous knowledge of the characteristics of the various foods tested, I should not have anticipated just the results obtained from the use of well cured oats and peas, but I do not question the correctness of his results, as I have always used these foods in connection with corn and cotton-seed-meal. In such a combination, I regard both as valuable, when fed to a butter-producing herd; but the characteristics of the two former constituents would naturally counteract the defects claimed for the latter, and thus make an excellent combination, as I practically find them to be.

Whiting, Vt.

FROM C. M. LUSK.

My experience with some of the kinds of feed mentioned is limited. There is no question in my mind that the feed makes a vast difference in the quality of the butter. I have fed buckwheat ground and found that I got a greater quantity of milk, but it was not very rich in butter and what was produced was white and of an inferior quality similar to winter butter. I find the same to be the case with wheat bran and middlings; but the butter from them is not so light-colored. I have also found that ground oats do not make good butter. Corn-meal makes butter that is high-colored, firm and of the best flavor. I have not fed cotton-seed-meal or linseed-meal. I do not feed oats. To increase the flow of milk I feed middlings and bran, and corn-meal to improve the quality of the butter. There is as much difference in the quality of butter from the different feeds mentioned as there is in that from dry hay and grass fresh in June. As far as my experience goes, I agree with Mr. Stewart, and my experience covers a period of over 25 years, having had a dairy during the whole time.

Broome County, N. Y.

Pomological.

A NEW SEEDLING APPLE.

I SEND the R. N.-Y. a box containing two apples, seedlings from this county. The original tree grew from seed planted in a fence row, 65 years ago, and is still in good bearing, although showing much age. The specimens I send were taken from younger trees grafted from the parent. Its age proves its longevity and hardiness—it is surely an iron-clad. Its bearing qualities are first-class. The fruit does not scab or drop. The tree is an upright, strong grower, bears its fruit evenly on the tree and is a constant bearer. Our local nurseryman from whom I procured the samples sent, says that the fruit is to-day the best in western Indiana as to quality. While mellow in October, it will keep till March. This apple should be brought before the public. A. C. B.

Park County, Ind.

R. N.-Y.—This apple (but one specimen was received) is, in shape, oblate-ovate, with a deep cavity, a short stem, shallow basin and calyx. It is about the color of King (Tompkins County) obscurely striped and lined with yellowish-red. The flesh is yellowish-white, tender, fine-grained, slightly sub-acid, aromatic. It is an apple of excellent quality and in so far as can be judged by the one specimen, it is well worthy of introduction.

Sheep Husbandry.

WINTER FEEDING OF SHEEP.

Hard to restore good condition once lost; extra feeding must be begun slowly; salt indispensable; how to feed it; separating the different classes; all poor animals should be culled out; regular feeding of paramount importance.

A NORTHERN MICHIGAN THRASHING SCENE. FROM A PHOTOGRAPH. SEE FIRST PAGE. FIG. 270.

IT must be remembered that sheep are not to be allowed to get thin during winter with the idea that their condition can at any time be readily raised by better feed, as in the case of the horse or ox. It is always difficult, and, unless properly managed, expensive and hazardous to attempt to raise the condition of a poor flock in the winter, especially if they have reached that point where they manifest weakness. If the feeding of a liberal allowance of grain be suddenly commenced, fatal diarrhea will often supervene. All extra feeding, therefore, must be begun very gradually; and it does not appear in any case to produce proportionate results. Roots, such as ruta-bagas, Irish potatoes and the like, make a substitute for grain or serve as extra feed for grown sheep. The ruta-baga is preferable to the potato in its equivalents of nutriment. No root, however, is as good

for lambs and yearlings as an equivalent of grain. Sheep may be taught to eat nearly all the cultivated roots. This is done by withholding salt from them and then feeding chopped roots a few times, rubbed with just sufficient salt to induce them to eat the roots to obtain it; but not enough to satisfy their appetite for salt before they have acquired a taste for the roots.

Sheep undoubtedly require salt in winter. Some salt their hay when it is stored in the barn or stack. This is objectionable since the appetite of the sheep is much the safest guide in the premises. The salt may be left accessible to them in the salt-box, as in summer; or an occasional feed of brined hay or straw may be given them in the warm, thawing weather, when their appetite is poor. This last is an excellent plan, and serves a double purpose. With a wisp of straw, sprinkle a thin layer of straw with brine, then make another layer of straw and give another sprinkling and so on. Let this lie until the next day, for the brine to be absorbed by the straw, and then feed it to all the grazing animals on the farm, which need salt.

If flocks be shut up in small inclosures during winter, it will be necessary to divide them into flocks of about 100 each, consisting of sheep of about the same size and strength; otherwise the stronger will rob the weaker, and the latter will rapidly decline. This is not so important where the sheep roam at large; but even in that case, some division and classification are best. It is best, indeed, even in summer. The poorer and feebler can in this way receive better pasture, or a little more grain and better shelter in winter. By those who grow wool to any extent breeding ewes, lambs, and wethers are invariably kept in separate flocks in winter, and it is best to keep yearling sheep by themselves with a few of the smallest two-year-olds and any old sheep which are kept for their excellence as breeders but which cannot maintain themselves in the flock of breeding ewes.

Old and feeble or wounded sheep, late-born lambs, etc,, should be placed by themselves, even if the number be small, as they require better feed, warmer shelter and more attention. Unless the sheep are of a peculiarly valuable variety, however, it is better to sell them off in the fall at any price, or to give them to some poor neighbor who has time to nurse them and who may thus commence a flock. If any one principle in sheep husbandry deserves careful attention more than others, it is that the utmost regularity must be preserved in feeding. D. W. T.

Homeworth, Ohio.

Farm Economy.

MORE ABOUT

Marketing Crops.

CONNECTICUT.

HARTFORD County, October 14.—My principal crop is leaf tobacco, and it is the only crop raised in this section the product of which exceeds the local demand. Dairy products are next in importance. I also sell some hay, potatoes, beef, poultry, eggs and fruit. Tobacco is sold to buyers who come through the country looking for it, and the price depends more on the quality of the leaf than on the figures in the market. Prices last season ranged from 10 to 25 cents per pound. As an almost invariable rule, early sales are the best, and the season to buy begins as soon as the tobacco is grown, while it is in the field, and continues till the next May. As to keeping posted on prices, sales of tobacco and the prices received are reported in the local newspapers. I never hold if I can get a fair price; but it sometimes happens that the buyers get afraid of the crop and will not buy except at a very low figure; then it is advisable to hold, as there is little to lose and possibly something to gain. I sell my cream to the creamery company of which I am a stockholder, and at present I am selling the skim-milk for one cent per quart to a peddler who sells it in a neighboring village. Other products are also sold in the same village at the market prices at the time of selling, which is whenever I have time to carry them to market. E. P.

DELAWARE.

CLAYTON, Kent County, October 19.—My chief crops are peaches, grapes, strawberries, raspberries, currants and gooseberries and I have to sell each crop in its season. To post myself on the markets, I take the R. N.-Y. and a number of other papers and during the fruit season I received daily telegrams this year. The crops were light and poor in quality and prices were low. A. S. R.

SMYRNA, Kent County, October 19.—My chief crops are peaches, pears and, until the last three years, grapes. Black rot has destroyed the grape crops of these last three years. In marketing I am governed by the ripening of the fruit and ship to commission-men or sell to any one offering satisfactory terms. Like my neighbors, I am informed by telegraph of the condition of various markets by commission-men, so we are very much at their mercy. I like the plan suggested in a late R. N.-Y. of auctioning the fruit and think some such plan must soon be adopted.

Of corn I grow "Sheep's-tooth" or "Southern White" and sell to a local agent who allows 10 cents per bushel above market quotations for yellow. I keep posted on the markets by reading the papers and am somewhat influenced by suggestions on the market, as given by the R. N.-Y. This year I tried two acres of potatoes planted according to the RURAL Trench System and raised 488 bushels. I gave a light dressing of manure broadcast and 500 pounds of special fertilizer per acre in the trench. This yield is one of the best, and as far as I know, the best in this section, the yield generally being 100 to 150 bushels per acre. I want to do better next year on the same plan, but with more fertilizers. W. P. C.

INDIANA.

CARMEL, Hamilton County, October 21.—Our chief crops are hogs and wheat. The former we are almost compelled to sell when they are ready; but we are governed somewhat by the reports of the market in the daily papers. Generally we hold our wheat till late fall or winter on account of the better price after the rush that follows thrashing. J. R. C.

MARYLAND.

CAMBRIDGE, Dorchester County, October 18.—My chief crops are wheat and corn. The sale of these is a lottery. I have tried shipping at all seasons and have come to the conclusion that an early shipment is, in the majority of cases, the best. I aim to post myself as far as possible on the state of the market by the daily papers and the R. N.-Y. I have been holding my grain this season on account of the supposed shortage in Europe and the decrease of our surplus: but I shall now sell. J. C.

TRAPPE, Talbot County, October 21.—For some years I sold my crops just as soon as I could get them in order—the earlier the better—but for the last two years (since prices have declined to an almost unprofitable extent) I have studied the crop reports of the R. N.-Y. and those of the Agricultural Department as to home and foreign supplies. If the Western or European crops are short I hold, otherwise I ship. I held my wheat till June of this year owing to reports of short crops and missed it. WM. C.

MICHIGAN.

ELMIR, Sanilac County, October 18.—We sell our chief crops in October and November. Clover seed is sold in February. I keep myself posted on the markets by studying the reports in the R. N.-Y. and the Toledo Blade—the two best papers in the world. I sell because I want cash. If wheat is low, I hold it till May and June. When wheat is scarce, the market is high. C. L. M.

OHIO.

ANDOVER, Ashtabula County, October 19.—How to get the most money out of what we have to sell is a matter deserving the careful attention of every farmer. It takes money to lubricate the wheels of domestic life, so that it does not matter so much how many tons of surplus farm products we have to offer for sale as it does how much cash we can drop into the bank to be credited to our account. Some farmers of my acquaintance act under the iron-clad rule of selling everything "as soon as it is ready for market." I do not consider this a wise course to follow. There are always thousands and tens of thousands of farmers who are so "hard up" that they are forced to sell anything that will bring them a little money. As a rule, they fill the market immediately after harvest with their wheat, corn or potatoes, and the farmers who hold off for a while until the "glut" upon the market caused in this way has been worked off are, as a rule, the men who obtain the top prices. I would not be understood as advising farmers always to hold their crops for higher prices. It very often happens that the earliest in market take the cream of the prices. I usually try to know what the future prices are likely to be. My commission-men keep me informed as to prices and supply and demand by sending me their weekly quotations. The State and National Agricultural Departments furnish full information in regard to the yield of various farm crops. If the yield of a certain perishable crop—like potatoes—is below the average, as reports this year indicate, the probabilities are that the price of that particular farm product will advance. If we take the subject of grain under consideration, the crop of a single year is not all we have to consider We must inquire further and learn how much surplus carried over from former years we have to add to the amount produced. We must know something of the demands of the world for our wheat, corn, oats or barley and inquire if other nations have a deficiency, how much of our surplus will be demanded to feed their inhabitants. I often obtain valuable hints from the doings of the gamblers in the grain markets of New York and Chicago. The members of the Board are pretty well informed upon this subject. If their bids upon wheat for delivery three or four months hence indicate a considerable advance or decline, I take the hint, or, as the boys express it, "catch on." In short, I avail myself of all the information within my reach and then act upon my own judgment. C. T. L.

BELLAIRE, Belmont County, October 18.—So far as selling is concerned we have to depend entirely on our local market. Our cereals, berries, garden produce and fat stock are sold in Bellaire. We raise fruits of almost all kinds and find a ready, if not a very remunerative market for them in the same place. In an apple year, we sell our apples to a dealer who ships them to other markets, and we can tell about what he makes by reading the agricultural and other papers that give market reports, and I find that our local markets are about as good as those at any other point. I have been taking the Ohio Farmer for many years, and am taking the R. N.-Y. this year, and I find in them about all the information that one needs about the markets, and in fact sometimes more than will give satisfaction—when, for instance, apples are bringing a good round price, and a man has none to sell. Last year they were a drug on the market; this year there are none. Farmers who have any are selling them for $1 to shippers and for $1.25 to $1.50 in our local market. This is because a shipper makes a clean sweep of all and the farmer gets his money in a lump; whereas if he hauls them to town, he loses a day, and expenses besides. So he doesn't gain much by the higher price. I was looking for potatoes to command a better price, but have failed to find the expected figures. Reports seemed to indicate a shortage that might cause a brisk demand and better prices, but they are as low as last year (40 cents) and there are no signs of any advance. I. H. D.

PENNSYLVANIA.

BROOKLAND, Potter County, October 23.—We have a local market for our produce in the lumber district just south of us here. Our principal crops are hay, oats and buckwheat, in the order given. Prices are regulated by the Buffalo or Western prices in car-lots delivered at the nearest railroad shipping points, plus cartage into the country, for there is generally a deficiency in this section. For the last two or three years, however, we have raised rather more hay and buckwheat than we used, and those nearest the railroads have shipped some to city markets; but we do not raise more than half the oats, and almost none of the corn used for ground feed. Prices at present are about as follows; hay, $10 to $12, loose, per ton; oats, 33 to 35 cents per bushel; buckwheat flour, $2.50 per 100 pounds. Prices vary a little, according to expense of delivery. W. D.

BADEN, Beaver County, October 16.—A few years ago we left a farm in Ohio, which was five miles from a railroad. Here we are 21 miles from Pittsburgh and five to nine miles from other and smaller manufacturing towns, and a railroad runs through the farm. It has taken me a few years and perhaps more than a few blunders to learn several things. One should not try to garden and farm at the same time unless he has plenty of help, as one or both occupations are likely to be neglected. Better lay out only enough work for a wet season; then if you are favored with a dry season in which to do the stint, all right. But if you lay out work for a dry season (as I did this year), and get a wet one (like the spring and summer of 1889, for instance), take care. My aim now is to feed all the hay, oats, corn and fodder I can raise on the farm. The straw I use for bedding. If we have more wheat than we can use, I have it ground at a good roller mill and sell the flour to families in some of the neighboring towns, keeping the bran and middlings to feed to my cows or hogs. Hogs I try to have ready for the butcher early. Our first markets in the fall for hogs appear to be as good as any. My hogs run in the orchard through the summer where they are kept in good condition, and do not require much corn to get fat if the fattening is done early, before severe weather begins. If potatoes or apples bring fair to good prices in the fall, I think it better to sell them then than to hold them over-winter and run the risk of their freezing or rotting and of bad roads for hauling them away, and possibly lower prices. I learned a few things about selling butter here. Each store-keeper appeared to have his own price which was sometimes as much as six cents per pound more or less than that offered by the next one, perhaps only a few rods away and very easily overstocked. I now have regular customers for my butter, and am trying to make more of it. Calves I generally sell for veal when they are four to six weeks old. J. W. D.

KNOX, Clarion County, October 12.—First I sell my chief crops as soon as I get them ready for market, if the price suits, and the price always suits on a rise. I do not try to get the highest market possible, but I avoid the lowest, which often follows holding too long. One "step I take," to keep posted is to subscribe for the RURAL NEW-YORKER; further I study the condition of the markets of the world, as given through reliable sources. I "determine" as to "selling or holding," as the girl did about getting married. She said: "I read in the Bible that they that get married do well; while they who remain single do better; but I am satisfied to do well" so am I with regard to selling my crops. Hereabout we raise our chief crops from a deep sandy soil known as the "third sand," which on my farm lies at a depth of about 1,100 feet, and is richest at the bottom. We use a plow-point weighing about 3,500 pounds reaching to the bottom of the soil from the surface, but we never turn up this deep soil; nor do we ever sow; though we do sometimes plant a torpedo in it. We experience no difficulty in cultivating our deep soil. We raise the crop by means of a sort of bean pole, known here as a sucker rod. I need hardly add that mine is an oil farm. M. E. H

VERMONT.

I DO not sell a great deal. I have a small farm of about 75 acres. I keep from three to five cows and one horse. I make butter and have eggs and pork which I sell here at home or I exchange for flour and sugar and other things that are wanted in the family. I sell all the maple sugar that I can make amongst my neighbors. Potatoes are very good this year; corn too is sound and good. J. Q. A.

Cavendish.

Most of our produce is sold to local buyers, although quite a number of our dairymen are sending their butter to commission-men in Boston and other cities in Massachusetts. The ruling price here the past season for good butter has been 14 cents per pound; while those that have shipped their butter have received from 16 to 18 cents. All the grain we raise is fed on our farms and a large amount of Western corn is yearly bought and fed. Farmers here are feeling the effects of low prices for their produce while paying high prices for farm labor: $20 per month is the price paid this season and the chief question asked among farmers is how are we going to pay our family bills, our taxes, our help and the interest on our mortgaged farms, and the question is a serious one. Here are the prices now offered for what we have to sell: wool, 25 cents; butter, 15 cents: potaoes, 35 cents; oats, 35 cents; hogs, fat, four cents per pound; beef cattle, $3 per 100 pounds: store cattle, calves, $4; yearlings, $8; 2-year-olds, $12; cows $15. How are these for prices in old Vermont?

Lowell. F. H. S.

Everywhere.

RURAL SPECIAL REPORTS.

Illinois.

SENECA, Lasalle County, October 25.—Potatoes are a large crop; price 25 cents per bushel. Several car-loads have been sent from here to Eastern New York. I raise the Potentate for my main crop and think it is the best potato I have ever planted. D. L. C.

Indiana.

ANGOLA, Steuben County, October 20.—Clover seed is two-thirds of a crop—from two to five bushels to the acre. Crops in general were good. We have a good supply of hay of which there was three-fourths of a crop. Corn and oats yielded about the same, and there was an increased crop of potatoes and apples, especially of the latter. Over 100,000 barrels have been already shipped out of this county and more than as many more are still to be shipped. We have two large cider presses and evaporators in this town in addition to others through the county all doing a big business. Hog cholera is very bad in the western part of the county. One man lost all he had except one pig—180 head. Another lost over 200, but notwithstanding all that, business is very lively and everything is on the boom. We are located in the northeast part of the State and this is the highest county but one in it. We have beautiful spring water and 72 lakes well stocked with all kinds of fish, besides many beautiful resorts and a fertile soil, so that I can see no reason why we should not be a prosperous community. I am the originator of the Dutter Seedling Strawberry and it is with me the best I have yet found, and I have 43 varieties. I am a reader of the RURAL NEW-YORKER and it is the best of its kind in the land. We have had a very dry fall. Early-sown wheat looks well, especially on gravelly or loamy soil; but later-sown wheat looks bad on clay soil. J. D.

Michigan.

HOWELL, Livingston County, October, 21—The large kind of clover seed is turning out very well as reported by thrashers—about 20 per cent. above the average. On account of the drought, pure clover seed is a short crop, yielding only about 25 per cent. of an average. Wheat averaged a fraction over 17 bushels per acre, and was very badly shrunken. Oats yield is placed at 37 bushels per acre; though some claim to have raised 65 bushels. The potato crop was badly injured by the drought. The yield is about 65 per cent. of an average—no rot. Winter apples yielded better than farmers thought when they first commenced to pick—about 80 per cent. of an average. From this town up to October 17 9,000 barrels of winter apples were shipped, besides over 6,000 bushels of cider apples, the latter being shipped to New York State. One firm bought 1,200 bushels of cider apples in one day. Corn is about 40 per cent. of an average and the ears are very short. The prospect does not look very favorable for wheat next year. Little of it has come up yet, though it has been sown five and six weeks. Some farmers have not sown any wheat, the ground having been too dry. The drought still continues, and is the worst ever experienced in these parts. We have not had any rain to help plowing since June 27. C. P. J.

HART, Oceana County, October 20.—The weather is very dry and cold at night. Potatoes are about all dug. They were marketed first at 30 cents, then the price dropped to 25; and now it is only 20, though the quality of the crop is the best—no rot. Corn is a rather poor crop. I. H. F.

New York.

RUSHFORD, Allegany County, October 24.—Farmers are feeling a little blue in this section. There is no fruit of any kind. Potatoes are about one-half a crop on an average; but of good quality. There was a fair yield on dry soil; but on river flats and mucky land the crop was very poor in quality and yield. Hay a good crop. Oats gave a light yield. Winter wheat was a failure on account of the spring frosts. Prices for all kinds of cattle are very low. The price of cheese has averaged low, and it has taken more milk than usual to make a pound of cheese. A. L. L.

Pennsylvania.

EVANS CITY, Butler County, October 24.—In this part of the State we raise mixed crops. Wheat was a full crop; rye a good one. Oats were not extra; they rusted. Corn is not half a crop; the weather was so wet from planting time till harvest that the land could not be worked. Potatoes are not half a crop; they blighted and rotted very badly; there are fields not worth digging. Some don't get more than the seed. Hay was a good crop and it was secured in pretty good order. There is a great deal for sale. Not much wheat has been sold yet; the farmers don't thrash till the beginning of winter. It sells at 85 and 90 cents per bushel. Oats 30 cents; corn 50 cents; potatoes 50 cents; hay sells for $8 to $9 per ton delivered at the railroad. We can sell all of our marketing at home as this is in the oil country where a great deal of produce is consumed. J. O. C.

FLOURTOWN, Montgomery County, October 28.—Wheat is a full crop. Corn, about being husked, will generally be good except where injured by excessive rains. Oats are good in quantity, but very light in weight. Potatoes with us have generally been a failure on account of too much rain. Hay has been an unusally good crop. A great amount of it is hauled loose on wagons to Philadelphia. It is now selling at from 60 to 85 cents per 100 pounds according to quality. Most of the farmers in our locality sell milk, shipping it on cars to Philadelphia. The price per quart is three to 3½ cents in summer and four in winter. Much of it also is sold to dealers who serve it through the suburbs of the city. Some few farmers serve their own milk to the families. This pays best when it can be rightly managed. Some farmers thrash their grain soon after harvest. I generally do my thrashing during the winter as it is necessary for me to keep hired help by the month. I feed during winter oat-chaff together with cut corn-fodder and clover hay made wet and mixed with corn meal, bran and linseed-cake-meal. This gives very satisfactory results. S. Y.

Wisconsin.

DELAVAN, Walworth County.—Dry here; cisterns, wells and streams all low. This is our third dry season in succession. To counterbalance this will the floods come next year? Among farmers there are bitter complaints of low prices for farm produce. T. K. P.

A PLUM ORCHARD.

F. L. A., East Pepperell, Mass.—I wish to set a plum orchard of 200 trees; what varieties for market and home use shall I set? The land is level; soil a moist sandy loam. I am told that for such soil the Lombard is best, and that in market it is as much a standard among plums as the Baldwin is among apples; is that correct? Would a heavy mulching composed of equal parts of mulch and good stable manure, well mixed, and allowed to stand over winter, be good to apply to trees set last spring and next spring; or would it be better to apply it only to those set last spring?

ANSWERED BY T. H. HOSKINS.

The Lombard is generally regarded as the best market plum for Southern and Middle New England, and is successfully grown up to the Canada line (45 degrees north) in the Champlain Valley. It is of medium size and quality, and the tree bears heavily. It grows and bears well on medium light soils, if they are not too sandy and infertile. In such a soil manuring and mulching are needed. Ashes and chemical fertilizers, such as ground bone and potash salts, are well suited to plums and other stone fruits. Boston is an excellent market for plums, if the seller can keep clear of the middlemen, who in that city (and most others) want about all the profit there is in what passes through their hands. As for the substance of the mulch, if the manure is used I should prefer it to be pretty strawy, but it is better to work the fertilizing material into the soil between the rows, and put the mulch around the trees, over a circle eight or 10 feet in diameter. The roots of the trees soon fill all the ground between the rows, and therefore whatever fertilizer is used ought to be applied evenly, and worked well into the soil. The fall is the best season to do this, but an application should be made in spring rather than none.

SCRATCHES OR GREASE-HEEL.

O. B., Sodus, Mich.—My six-year-old mare has been suffering from scratches or grease-heel for the last eight months, and no treatment given has done any good, though I employed a skillful veterinarian. During the summer the legs appeared now and then to be nearly healed, but the trouble would break out again. The legs swell over the hocks at night, but the swelling goes down when the animal is worked. She eats well, is full of life, and always seems to feel well. She is with foal. Is there any remedy?

ANSWERED BY DR. F. L. KILBORNE.

I do not know that I can give a *sure* remedy for grease-heel or scratches, but I can advise a course of treatment that almost always effects at least a temporary cure: Individual cases of all chronic diseases of this kind often require special treatment, and two or more trials may be made before hitting upon the remedy that is adapted to that particular case. Because a remedy has proved a *sure cure* in one case, it is not certain that it will do so in another. For the local treatment, rub benzoated oxide of zinc well into the cracks once daily until the crusts have been all softened and removed, leaving a clean, healthy-looking surface. Then apply daily an ointment of equal parts of spermaceti and almond oil. *Do not wash* the limbs to clean them, but simply rub or brush dry. Keep the animal out of the wet and mud as much as possible, and whenever she comes into the stable with wet limbs, rub them dry. Internally, give two table-spoonfuls of the following powders in the feed night and morning: sulphate of soda, 16 ounces, powdered gentian, eight ounces, iodide of potash, eight ounces, powdered nux vomica, four ounces: mix.

ANGORA GOATS.

E. D. A., Buffalo, N. Y.—Will the same care and feed given to sheep do for Angora goats? Is our climate too severe for them, and should they have better shelter than that which will do for sheep? Are they subject to any particular disease which can be guarded against? About how many pounds of "hair" do they shear, and what is the best market and how much per pound does the hair fetch?

ANSWERED BY MILLER & SIBLEY.

Angora goats do not thrive well upon marshy ground. They should have shelter to which they can run in every rain storm, as there is no oil in their fleece, and they instinctively seek shelter from storms. They do best on hilly land and will live on twigs, sprouts, etc., where sheep would starve to death. Our flock, numbering about 200 head, does more towards keeping down sprouts on newly cleared land, (as we are informed by our man in charge) than would a force of six men constantly employed. If running on wet land, they are liable to get sore feet, which, however, are easily cured up by a little attention. Our best billy sheared nine and one-half pounds. The weight of the fleece varies greatly with age. We should say that five pounds would be a large average fleece for animals in their prime. At one time the price was one dollar per pound and upwards, but at present we understand it is considerably less; we think 35 cents.

ABOUT POTATOES.

W. G. S., Benedict, N. Y.—1. Why have we no potato balls now? Is it on account of the Colorado Beetle? 2. How do potatoes "mix" in the hill?

ANS.—1. It seems to be a law of nature that as we change plants to our needs or "*improve*" them as we may, they deteriorate in other ways. Thus double flowers are produced at the cost of stamens and pistils. Many fruits—apples, pears, oranges, for example—as they are increased in size become seedless. We grow potatoes for the tubers and the plants having been propagated by tubers through generations, their nature is changed. We produce larger tubers and more of them. The energy of the plant which, generations ago, was divided between tubers and seed-balls, is now directed towards tubers entirely. 2. Potatoes do not "mix" in the hill. It is impossible. Any variation in potatoes, that appears in the product of the same seed potato, is owing to *bud* variation—just the same as any green-leaved plant is liable to produce a colored-leaved shoot. These are called "sports" for want of a better word. It seems to the R. N.-Y. probable, as it has before stated, that "sports" are really the cropping out of foreign blood or hybridization, the effects of which, though dormant for years, finally become potent through peculiar conditions.

NASAL DISCHARGE IN A HORSE.

E. P. R., Midland, Mich.—My seven-year-old mare has a slight discharge from the nose, looking like thick, sour milk. It is only noticeable when she snorts or blows her nose. She has no cough and is in fair condition. She has been in pasture nearly all summer during part of each day. This discharge has continued all summer. What can I do to cure it?

ANS.—Feed a hot bran mash daily at night, and add two table-spoonfuls of the following powders: sulphate of iron four ounces, Barbadoes aloes four ounces, nitrate of potash 16 ounces, powdered gentian eight ounces. Rub the whole region of the throat externally and daily with the following liniment until the skin is slightly blistered: white Castile soap and camphor gum, each two ounces, spirit one pint, aqua ammonia and sweet oil, each one-fourth of a pint. Mix. Shake well before using.

ABOUT FRUIT TREES.

G. S., Brooklyn, N. Y.—1. If a young fruit tree is planted in an old orchard, say about four feet away from where the old stump was taken out, will it thrive? I have been told it would not grow. 2. Is it true that nothing in the shape of a fruit tree will grow within 30 feet of a walnut tree?

ANS.—1. The roots of old trees extend in all directions further than the branches. The soil becomes more or less exhausted unless the orchard has been well supplied with plant food. It is for this reason that young trees make a feeble growth in such places. The best thing to do is to enrich the land. 2. This is an old story. Thirty feet from the walnut is too close to plant a fruit tree. Aside from the obstruction offered by wide-reaching tops and roots of the walnut, fruit trees will grow in its vicinity as well as in the vicinity of other trees.

FUNGOID ON RASPBERRY CANES.

E. H., Jonesville, Vt.—I send to the R. N.-Y. samples of the Turner Raspberry canes for examination. What is the disease that affects them? What is its cause and is there a remedy?

ANS.—There is no known remedy. It is caused by a fungus which attacks the canes of the current season, first attacking the bark, then extending deeper until the cane is killed. The berries wither. This dread disease is so rampant at the Rural Grounds and in many other places that the culture of raspberries is practically impossible. Unless some remedy be found raspberry culture will be a thing of the past.

Miscellaneous.

E. W., Salem, Indiana.—W. Atlee Burpee, of Philadelphia, Pa., sells Scotch Terrier dogs.

A Subscriber, Sussex County, N. J.—Our seedsmen know nothing of any corn by the name Rocky Mountain. It was probably a local name for the old white flint.

H. R., Waterbury, Conn.—What is the best way of advertising for a situation for a first-class butter-maker?

ANS.—By stating his qualifications in the advertising columns of the R. N.-Y.

Subscriber, Union County, N. J.—What is a reliable mining paper—not so much for the stock quotations, but for general information concerning mining interests?

ANS.—Send for samples of Mining Review, Chicago, Ill.; Mining and Scientific Press, San Francisco, California; and Engineering and Mining Journal, New York.

E. A. F., Hancock, Vt.—What is the name of the inclosed variety of buckwheat?

ANS.—Our seedsmen here know nothing of the variety, and the catalogues make no mention of it. The grains inclosed have very much the appearance of the common gray buckwheat, but have a deep suture down the center of each face. Do any of our readers know anything of it or its value?

D. P. R., Downieville, Cal.—Does the peach yellows affect seedling trees that stand where the pits were planted?

ANS.—The disease called the yellows appears to be as likely to attack untrans-

planted seedling peach trees as trees that have been transplanted. It seems likely, however, that seedlings of improved varieties will be more liable to attack than others, because they are more "delicate and refined."

E. F., Portland, Oregon.—1. What would be a proper rent to ask for a 100-acre cultivated farm which yields an annual income of $1,000 to $1,400, teams and tools to go with the land? 2. What organ would be best for children who want to learn to play, tone, price and durability being taken into consideration?

ANS.—1. We cannot say. So much depends upon the condition of the farm, its location and other conditions that we know nothing about. 2. The Cornish organ is cheap and durable—worth its price.

B. S. V., Marlboro, Ohio.—My Jersey cow dropped a calf about six weeks ago, and for the last two weeks one quarter of the udder has been gradually swelling and hardening. The milk comes slowly from that quarter, though little if any soreness appears to be present. The skin there seems to be twice as thick as it ought to be. The milk appears good; what should be the treatment?

ANS.—Bathe with hot water two or three times daily and rub thoroughly dry each time. Then apply belladonna ointment, rubbing it well in. Give one table-spoonful each of glauber salts and nitrate of potash once or twice daily in feed.

C. E. M., Perrineville, N. J.—Our cattle here are afflicted by a disease with the following symptoms. Their milk shrinks; the teats swell and become sore; the dung is hard, and the urine red. They stop eating and either lie down or keep walking from one part of the field to another. The end of the nose is red. What is the trouble?

ANS.—We cannot give a satisfactory diagnosis from the description. We suspect, however, the disease may be Texas fever; but in the absence of the history and extent of the outbreak we cannot say positively. If our suspicions be correct the disease will disappear after frost. Treatment is not satisfactory.

P. G., Oswego Falls, N. Y.—1. Will pine shavings used as a mulch for strawberries have any injurious effect on a light, sandy soil? 2. What causes newly cut capons to bloat up between the skin and the body? When the bloated part is pierced with a penknife the air rushes out as if coming from a punctured balloon. 3. If a testicle, after being detached from a bird, is left in the body, will it have any effect on the health of the bird? 4. Does my third question answer my second?

ANS.—1. Not if partially rotted. We would not advise a heavy application, if fresh 2. The trouble is caused by the respiration of the bird, when the skin is not closed over the incision; puncturing the bloated part was the correct treatment; but one should not make any larger opening than possible. 3. No good effect. It would probably act like any other foreign matter, and might lead to inflammation. 4. No.

E. O., Carroll, Iowa.—1. Which is the best hand cream separator? Where can it be obtained and at what price? 2. What are the best books and papers on the general management of poultry? 3. What are the best markets for potatoes from this place? 4. Who are reliable commission merchants in New York and Philadelphia?

ANS.—1. The De Laval is a good separator. Write to P. M. Sharpless, West Chester, Pa., for circulars and prices. 2. The Poultry Keeper, published by the Poultry Keeper Publishing Co., Parkesburg, Pa., is among the practical poultry papers published. The same firm publish several cheap books relating to the several branches of poultry culture. I. K. Felch, Natick, Mass. also has a very good book on breeding. The Orange Judd Co., 751 Broadway, New York, also publish several books on poultry. 3. Prices are higher in the Eastern markets, but of course freight rates will partially balance the extra price. Compare prices in the different cities, and then by learning the freight rates from your place, you can determine which place offers you the best market. 4. E. & O. Ward, 279 Washington Street, and S. H. & E. H. Frost, 100 Park Place, New York, and Warren, Harper & Bro., Philadelphia are reliable commission merchants.

Discussion.

SOME ITEMS OF THE COST OF LIVING IN COLORADO.

O. H., GREELEY, COL.—I herewith send a table which gives the number of our family and the yearly cost of sugar, coal, bread, etc:

17 YEARS—1872—1888.

	No. of Adults	No. of Child'n	Equivalent to No. of Adults	Yearly Cost of Sugar & Mol's.	Cost for Each Adult.	Breadstuffs of All Kinds.	Coal & Wood.
1872	3	1	3	$39.90	$10.97	$82 80	$58 65
1873	3½	2	4	44 16	11.04	57 64	60 65
1874	4	2	5	47.28	9 46	69.65	64.60
1875	4	3	5½	41.00	7.45	68.23	54.20
1876	5	4	7	42.27	6 04	78 76	52 65
1877	5	4	7	60.48	8 64	76.84	47.29
1878	5	4	7	86-76	12.39	76.67	53 55
1879	6	4	8	67,07	8.38	61 91	55.35
1880	5	5	7	68.37	9.58	78.92	65.00
1881	2½	5	4½	43 47	7.66	71 75	54.85
1882	2½	5	5½	69.25	12.59	64.22	53.48
1883	2½	6	5½	66 95	12 17	62.77	43 75
1884	3	7	6½	77 50	11 92	68 45	49 00
1885	4	7	7½	54.20	6.22	59.10	40.70
1886	3	7	6½	56 00	8.61	59.30	27 38
1887	5	5	8⅓	46 40	5 48	69.65	26 00
1888	7	4	9	56.80	6 31	84.80	46.65

No account can be rendered of fruits, vegetables, butter, milk, cream, meat, fowls, eggs, etc., since these are raised on the place, at least in part. During the last 10 years we have generally bought flour, coal and sugar in wholesale quantities, thereby making a material saving. It would be impossible to compute the exact yearly cost of any article for each adult, because the supply of one year sometimes ran over and was used during the following one. The present computation extends over a period of 17 years—from 1872 to 1888 inclusive. For 1872 the cost of coal, with only one stove in use was $58.65, or $16.22 for each of the three adults composing the family. In 1888 the whole cost of coal was $46.65 with two stoves in use, or an average of $5.18 for each of the nine adults in the family. The per capita cost of sugar in 1872 was $10.63, and $6.31 in 1888: breadstuffs, including yeast, baking powder and saleratus, cost, in 1872, $27.60 per capita against $9.42 in 1888. The family expended per adult for coffee, tea, chocolate, cocoa, $1.96 and $1.20 respectively for the years under consideration. The family kerosene cost $4.90 in 1872, and $9.80 in 1888. As regards coal, it may be said that in the early days it cost $7.00 per ton, while it can now be had at $4.50 and $5.00 per ton. When Denver was nothing but a little village, and the Greeley flouring mills had just been built and the first products of irrigation were coming into market, wheat was worth from $1.50 to $2.00 per bushel, and we paid $7 for a 98-pound sack of flour. This will explain why it cost $27.60 for the bread of each adult in 1872, and only $9.42 in 1888, when we laid in our wholesale supply at a trifle over two dollars per sack.

It may be noticed that the cost of coal fell in 1886 and '87 to $27 and $26 respectively—much below the average. This was because in those years we tried the experiment of burning the low-priced nut-coal which is in reality the best of coal chipped out by the miners before blasting down the lump coal.

I remember when a boy hearing my father often make the remark: "If it cost only twice as much to shoe my girls as it does to shoe my boys, I would make no complaint." I thought then, and I still think, the remark was unjust to the girls, and I resolved that I would test the matter and know the exact cost of shoeing man and woman. By the way, what an improvement there has been in shoes for women's wear, especially in the thickness and width. Well, for 17 years and more I have stuck to my whim regarding the relative cost of men's and women's foot gear and clothing, and now for the first time the secret shall be divulged.

Common observation would seem to teach that it would not cost as much to walk on carpets and level floors as to wade through streams and tramp up and down on the rough earth through slush and among stumps; but some men do not see it in that light. Now, as a matter of fact, I paid $21.85 for my "understandings" in 1872, and my lighter and better half paid $5.65 for hers. She was in the house while I was breaking snow-drifts or walking many miles a day. To be sure that was an exceptional year. But in 17 years the average cost of my own shoes has been $13.94, and that of my wife's $6.32. and among the girls and boys of my family the case is even more against the male side of the house. As to the matter of clothing, women are charged with extravagance. Wife and I are plain, common people, always dressing humbly as those blessed with large families should, of course. Wife makes a good deal of her own clothing, and mends a good deal of mine which is largely bought ready-made. The average annual cost of my clothing is $39.98, and of hers $26; that is, those are the amounts of cash paid out.

DWARF LIMA BEANS.

PROFESSOR J. L. BUDD, AMES, IOWA.—I have read with much interest the reports of careful growers and observers on the relative merits and value of the so-called dwarf Lima beans. In connection with this discussion my experience in cutting back the runners for eight years in succession may have some interest. A few years ago the large Lima bean was used almost daily during its season in the college boarding department. We soon found that the poling of a full half-acre of Limas was expensive, and sometimes the vines wanted to go everywhere except up the poles, unless time was given to their training. This led to a trial of cutting back the climbing tendrils with a smooth Dutch sickle as often as needed, each time cutting a little higher. When the pods were large enough to begin picking, we found that we had quite stiff, bushy plants from two to three feet in hight well loaded with large, perfectly filled pods. I was so pleased with the experiment that it was continued for eight years, seed from selected pods growing near the ground being planted each year. Each year the tendency to running decreased and in the eighth year only a few runners started, but not to an extent requiring cutting back. At this time the vegetable garden for the use of the boarding hall was put in charge of the steward and the growing of Lima beans was dropped and the seed was lost. In addition I was told that a Lima-bean grower near Santa Barbara, Cal., had developed a tall bush variety by continued cutting back for six years.

AN IOWA MAN ON DWARF LIMAS.

F. S. W., DES MOINES, IOWA.—I had more than 30 varieties of beans under test this season. As to Lima beans for my family use, I have no use whatever for the bush sorts. True, I have only tested the Henderson Bush Lima which I have found to be no earlier than Extra Early Jersey, while it is hardly worth calling a Lima. In my catalogue for next season I shall recommend the planting of these beans only where people are too lazy to prepare anything better; for I regard them as better than no Lima at all. The Extra Early Jersey is the only Lima that can be relied upon here for a sure crop: every season I have raised some very fine crops of Dreer's and King of the Garden. The past season I had fine crops of the Dreer's, Early Jersey and King of the Garden, and have harvested, for the first time, a good supply of ripe beans. Under critical tests, the Dreer's was decidedly the best in quality, the Early Jersey being second, while the King of the Garden was the largest and most showy in appearance, and it sells well in the green state. I do not think preparing poles, and poling beans is such a tremendous or such an unprofitable job, as some do. In fact, I always feel well paid for raising pole beans It has been a fact well established in my family from father to son, that there is no variety of bush beans that will compare to any close degree in quality with our pole varieties. Here I have no trouble in securing good poles. I get good oak ones, from two to four inches in diameter at the but end and eight feet long, at a cost of a cent and a-half to two cents each. These will last four or five years, for I take them up every fall and put them away so that they are in the ground but little over four months. In spring I get my land well prepared, then mark out four feet, and with a shovel-plow make deep furrows, running the tool twice in the same furrow. A man follows the plow with a spade, and, every four feet, chops a loose place in the bottom of the furrow The poles are sharpened at the lower ends and are sunk as deep in these holes as a man can press them down by hand, and then with a nine-inch diamond plow I fill up the furrows around the poles and with a hoe make nice hills around the poles and plant my beans—always at least two good stands. This arrangement is for Limas: for other pole beans I do not make such careful preparations, neither do I use such large poles, as good brush will do for one season for a good crop of most other varieties of pole beans.

EXPERIMENTS WITH CORN.

O. K. L., INDIANOLA, ILL.—A neighbor used a subsoil corn-planter this year. It has two mold-boards, turns the furrows to the right and left and opens a trench from three to seven inches deep. Between the mold-boards is a tooth something like a cultivator tooth, that digs the bottom of the furrow. The corn is dropped in this loose soil. The ridges between the rows are 10 inches high. As the corn grows, cultivation levels these ridges; hence the seed and roots are deep and drought-proof. This is very essential on loose prairie soil if well drained. To carry this theory to an extreme: when growing corn began to start spur-roots from the joints, I put around a hill of corn a curb a foot high and filled it with soil and wet it occasionally. Spur-roots started from the buried joints, so I banked four feet high—nearly up to the ear. The three stalks made a powerful growth, pushed by the extra roots. If the soil is loose and deep try a few deeply-planted hills next year. Again, to study the smut question: I saved the smut from corn last year and put a handful in the hill at planting time. Every hill so treated showed symptoms of smut. I believe seed corn should be soaked or washed in copperas water. Dusting smut on the silk of growing corn afforded proof that the pest is reproduced in this way. Every hill so treated produced smut. Two-thirds of the cows and mares in this vicinity last year lost their fetuses, most likely from eating smutty or ergotted corn fodder. The book accounts of several stallions were worth only 10 cents on the dollar. There were so many "slinks," and the farmers lost the season or the use of the mares. Infected seed corn must be washed, and the land infested by ergot or smut must be put under some other crop. The trouble due to this matter hereabouts is getting serious.

MR. COLCORD SPEAKS.

S. M. C., DOVER, MASS.—I thank the R. N.-Y. very much for its recent editorial notice of my system of ensilage and find no fault with it for not being able to see the system in a stronger light. It says: "The high heating is considered beneficial, it being asserted that after a certain degree of heat is reached the product cools down, the ferment germs being destroyed." Reflection for a moment will discover that the heat and fermentation must, and do, commence at or near the center of the silo, and that the silage does not heat up near the walls for quite a while, so that this continual fermentation and heat continue until the silage is spoiled, and the loss is in quantity as well as quality: the fire cannot be put out. The editor is also in error in his closing sentence in which he says: "It is evident that counting the cost of the governor and the labor required in adjusting the pipes, and working the screws, the patent silage will cost more per ton than the common product." This I am happy to state is not the case. It will cost more in time and money to weight the silage than to press it with jack-screws, and for the amount of corn used in both systems one can take out more tons of perfect forage when mine is employed than he can of imperfect silage from the silo. I cannot compare the cost per ton where the same corn and the same pressure are employed, because I don't make the common sort of silage; but I have no doubt that the cost of the patent silage, ton for ton and pressure for pressure, is considerably less than that of the other kind, aside from its superior quality. Full reliance can be placed on the statements in my book about the economy, convenience and safety in the use of jack-screws.

N. M. H., ROSE, N. Y.—Do not afflict the community at large by deciding that the Blanchard is the best churn, for, unless worked by power, it is a man-killer. I prefer the dash; but the Davis is the churn for me. We keep 10 cows this summer and the churning is no trouble.

What Others Say.

MORE ABOUT ENSILAGE.

DR. MILES takes the sound view, as Prof. E. M. Shelton believes, that a number of small silos are better than one large one of equivalent capacity. The large silo exposes a large surface of silage during the time that it is being fed out; and, unless the amount fed out daily is large, considerable loss from molding and decay is likely to result. Prof. Shelton greatly prefers removing the silage by beginning at the top, taking it off an inch or more each day as the wants of the herd suggest, and shoveling the silage through a small shaft, located next the silo wall, to the ground. In calculating the capacity of the silo, Dr. Miles uses as a basis of computation the current

facts regarding the weight and daily consumption of silage by cattle, placing the weight of the cubic foot of silage at 40, and the daily consumption of silage per cow at 50 pounds. Of course there is silage and silage, and the Kansas College experiments of last year made with very great care gave figures considerably lower than these. The corn silage last year weighed exactly 34 pounds to the cubic foot, and the average daily consumption of silage by each of 60 head of cattle, one year old and upwards, fed exactly four months, was 34 pounds. The largest and most greedy cows were unable to consume much more than 50 pounds of silage daily, a slight increase on this amount being almost invariably followed by purging and like unfavorable symptoms.

Dr. Miles discourages the thick seeding of corn designed for the silo because of the feeble, immature, and watery character of the plants thus grown. It is doubtless generally true, as Dr. Miles remarks that "Indian corn will yield a greater aggregate of valuable cattle food per acre under good farm management than any other crop." although Prof. Shelton is inclined to think that, for Kansas, sorghum is a serious rival of the great staple for the purposes of the silo.

A GOOD STORY, which illustrates some modern business methods, is told by the Butchers' Live Stock Gazette:

Mr. Jones sold a bullock to Mr. Lazarus for $16, to be taken and paid for when fat. When Mr. Lazarus came for the animal Jones said he would like to have a forequarter for his own use. Mr. Lazarus willingly accepted the order and, after,the bullock was slaughtered, delivered the meat. A few days later Jones went to town, called on Lazarus, and, as a preliminary to a settlement, asked for his bill. "Dot's all right, Mr. Jones I haf the bill already made out. Here you are" Mr. Jones read.

MR. JONES, DR, TO JACOB LAZARUS—

To one quarter of beef, 185 lbs. at 10 cts.	$18.50
By credit one bullock	16.00
Balance due	$ 2.50

"Good heavens, Lazarus, you get three quarters of the beef, the hide, tallow, and offal, and bring me in debt $2.50. How's that, old man?"

"Ah, Mr. Jones, that beef vas sheap at 10 cents a pound."

"But, Lazarus, you only gave me $16 for the whole bullock."

"Ah, but, Jones, dot's pizness, pizness, do you see?"

"Well, Lazarus, next time I have a fat bullock I'll kill it myself, use one quarter and throw away the rest, and then I will save $2.50. You see?"

"Ah! ah! but dot's not pizness; farmers should not be butchers—dot's bad."

SAMPLES.

SECKEL PEARS are small and poor this year, as judged by those in the New York market.....

THE LAWRENCE is a late autumn and early winter pear, of fine quality, though not equal to the best and only partially melting; but it has the good quality of never becoming scabby; is always fair, and the tree holds its foliage late in autumn until the fruit is well matured. It is a good market variety. Thus speaks the veteran pomologist, J. J. Thomas in the Country Gentleman.....

THE SHELDON, Mr. Thomas says, when well grown under good cultivation is scarcely equaled for delicious flavor and for its excellent melting quality. Its rounded form and dull russet skin do not make it particularly attractive to one unaccustomed to its delicious character. The tree is not so reliable a bearer as some other varieties, and it is more subject to the blight. If the fruit is not well grown and well ripened it is poor enough.....

MOORE'S ARCTIC PLUM is rapidly growing in popularity along the northern border of plum culture, says Dr. Hoskins, in Orchard and Garden. Its vigorous growth, precocity in fruiting, hardiness, and resistance to the curculio, all commend it to growers; while as a market fruit it has many merits, and finds a ready sale. Farther south, some complaint is heard of its dropping, but nothing of this is seen northward. It bears very young, and tends to overbear, even to suicide. It is not strictly iron-clad, yet is plainly the hardiest among the varieties of European origin, barring the Russians, of which we as yet know but little, though that little is encouraging.....

H. M. ENGLE & SON send us fine Paragon Chestnuts as large as any of the seedling Japans we have seen raised in this country. An engraving of one of them will appear later. The quality of the Paragon is nearly as good as that of our largest American chestnuts, without the astringent skin of the average Japan. The R. N.-Y.'s oldest Paragon is two years from the nursery. It has made a short growth as, we fear, the soil and situation are not congenial.....

A WRITER in the London Garden mentions several rose authorities that pronounce Marshall P. Wilder and Alfred Colomb the same in every respect. The R. N.-Y. has had a good chance to compare these roses for three years past as a specimen of each has been growing side by side. The result is that except the Wilder has borne a few more roses and a little later, we cannot tell the one from the other.....

AMONG all the introduced climbing flowering shrubs says Garden & Forest, few have proved more satisfactory than Lonicera Japonica, var. Hallii. It differs from the typical L. Japonica chiefly in being practically ever-blooming, and from June until after severe autumn frosts its fragrant white and yellow flowers are continuously produced. It is becoming well-known and commonly planted. The well-known and very fragrant Dutch Monthly Honey-suckle (Lonicera Periclymenum) also has a few flowers at this season, but they are very apt to be unpleasantly infested by aphides. This is a decided objection to it. At the Rural Grounds not less than six frosts have occurred that froze water from an-eighth to a-quarter of an inch deep. The foliage of Hall's Honeysuckle is as green and fresh as ever and flowers are still in bloom here and there. If we could have but one climbing shrub it would be Hall's Honeysuckle.....

DON'T you know what to plant? Consult the American Pomological reports. Consult your nearest neighbor that is posted as to fruits. Consult the nearest honest nurseryman. If, without more definite information you care to make selections try, among strawberries, Parker Earle, Downing, Cumberland, Crescent. Among apples try Baldwin, Yellow Transparent, Gravenstein. Among grapes try Moore's Early, Eaton, Brighton, Niagara, Colerain, Berckmans, Ulster, Antoinette, Worden. Among plums try Reine Claude, Bradshaw, Imperial Gage. Among currants try Fay and White Grape. Among gooseberries try Downing, Houghton. Among cherries try Black Tartarian, Coe's Transparent, Gov. Wood, May Duke. Among raspberries try Cuthbert, Golden Queen (a yellow Cuthbert), Turner, Hilborn, Springfield. Among blackberries, Minnewaski, Kittatinny, Snyder. Among pears try Idaho, Tyson, Howell, Sheldon, Anjou, Bosc, Bartlett and Seckel. Among peaches try Good, Lovett's White for late, Troth, Crawford's Early, Salway, Stump.....

THERE is a widely prevalent idea that even a very ignorant person can make a success of farming. This opinion says student J. W. White in the Speculum, a monthly published by the students of the Michigan Agricultural College, is held not only by many town people, but by a large class of our farmers, especially those who have become wealthy without the aid of an education.

By looking over the history of our own country we may better understand why this idea has gained so strong a foothold. There never was a nation better supplied with cheap and fertile lands than ours. In addition to crops produced, these lands have increased in value to such an extent that large profits are realized from money invested in them. Many ignorant farmers have through these advantages reached their ideal success—wealth; hence their notion that an education is of no practical importance to the farmer seems fully demonstrated to those that hold wealth in like esteem.....

THE above journal for October presents a photo-engraving of the new professor of agriculture, Eugene Davenport, well known to R. N.-Y. readers as a frequent contributor to its columns. The sketch of his life is interesting. One cannot read it without feeling that Prof. Davenport is in every way well fitted for the position and that a more judicious selection could scarcely have been made.....

"AS A thoroughly practical man," the sketch concludes, "Prof. Davenport will demonstrate in the field what he teaches in the class room. As a hard student he will give the pupils under his charge solid meat. As a courteous, genial gentleman he will attract all students to him. As one "apt to teach" he will prove that the subject of agriculture can be made interesting in the class room. At least this is what his friends expect, and confidently predict. It is a happy omen that he comes with the hearty support of all who know him and love the institution."

IN the autumn of 1879 Dr. Beal buried bottles of seed of 21 kinds of plants. The seeds were mixed with sand taken from three feet below the surface, loosely placed in bottles and buried about 20 inches below the surface. During the past summer the seeds with the sand were removed to the botanical laboratory and kept moist for some time, when some of the seeds of Pigweed, Black Mustard, Shepherd's Purse, Pepper-grass, Mayweed, Evening Primrose, Smartweed, Purslane, Pigeon-grass and Chickweed produced good seedlings. Nearly four years ago he buried some black walnuts and acorns in well-drained sand, at depths varying from a few inches to about three feet. At the end of two years some of the acorns and walnuts planted near the surface were found to have come up the summer after being planted, while those buried from eight inches to two feet below the surface had all decayed. All the walnuts deeply planted had decayed, but some of the acorns buried from two to three feet were alive.....

WORD FOR WORD.

——VERMONT WATCHMAN: "Farming needs the whole man."

——HOARD'S DAIRYMAN: "There has been a greater per cent. of growth in the use of cream, in our cities, within the past two years, than in the consumption of any other product of the dairy. We predict its use will increase; for there are many finding out that cream is better and cheaper than milk."

——"AFTER a while, if the butter extractor succeeds, and supersedes, largely, present methods of making butter, the telling of how to treat cream and churn, will be as 'stale, flat, and unprofitable,' as to describe the old match and flint-lock guns of a past age."

——FARM & FIRESIDE: "Catalogue makers have gone about as far as they can possibly go. The painter's colors and the vocabulary of the English language have been drawn on until there is nothing left with which they can go further. It will be a good thing to see simple, truthful statements and natural illustrations and colors in common use."

——POULTRY MONTHLY: "In 'breeding for fancy points,' the 'points' are made of more importance than the poultry."

——WESTERN RURAL: "The estimate of the value of Montana differs with different visitors. If anybody desires to know what the country is, better go and see it and take nobody's word for it."

——CORRESPONDENT OHIO FARMER: "Should the churn swing or revolve? Both churns are operated to produce concussion upon cream. The one secures it by revolving, and the cream falling down upon the heads of the churn, is thrown into 'temporary confusion.' The other, by a quick swing and return, brings the cream into the end of churn and causes it to recoil back upon itself, and practically results in the same kind of agitation. In both churns the cream needs to be quite thin to get the best working. In the swing churn the washing and granulation of the butter can be carried on without a fastening on of the cover at each point of change. Both churns have their friends. If there is any point gained, it is in the salting process, the revolving churn giving the butter a little greater drop, may thus come a little nearer doing perfect work. So far as I can see all else is equal. I have both, so am not supposed to be partial."

——N. Y. TIMES: "A dairyman whose stupidity and obstinacy alone deserve the punishment is now in jail—refusing to pay a fine—for selling milk below the legal standard of quality—viz., 12 per cent. of total solids on the ground that the milk sold was precisely as it came from the cow. There are poor cows which none but an ignorant or a stupid man would keep, and it is a beneficent law which compels dairymen to get rid of the unprofitable beasts or inflicts a fine as a punishment for keeping them. It is as dishonest to keep a cow for the purpose of selling her milk whose milk is known not to be up to a reasonable standard equivalent to the price paid for it as to put water in better milk and reduce it below the standard. The imprisoned dairyman thinks he is a martyr, but he is simply a fool."

——CHAS. A. GREEN: "While there are many honorable real estate men in the West, there are many who are human sharks, seeking whom they may devour. Their plans are often well laid to deceive the most wary. No one should go West on the representations of strangers, and above all, should never engage to buy land that he has not seen. I was shown lands in California, Oregon and Montana, that had been advertised and sold as the best fruit lands in the world, that were not worth one cent per township, on account of location or barrenness."

——"While I might criticise the business men of the West as having too much enthusiasm, I own that Eastern men have not enough. Instead of Eastern men going West why do they not make more of their opportunities in the East? The East has advantages that the West has not. Why not make more of them? Why not make a plunge for success here? The answer is, it is so much easier to plunge where all are plunging. It is hard work stirring up the dead. As a Western friend remarked: 'Eastern people are asleep and they don't want to be waked up. All a live Eastern man can do is to come West where he will be appreciated.'"

——POPULAR GARDENING: "Dead-set against filling the cellar under the dwelling with vegetables and fruits—that's what I am."

——ALBANY CULTIVATOR: "An experienced commission merchant remarked that if the Anjou Pear only had a fine red cheek, it would be the best of all market varieties."

——CREDIT LOST:

"When usury presents a note,
On which your autograph you wrote,
Your heart within you rattles:
You struggle in the days of grace
To raise the value of its face,
Or get the sheriff on your place,
Then—good-by goods and chattels."

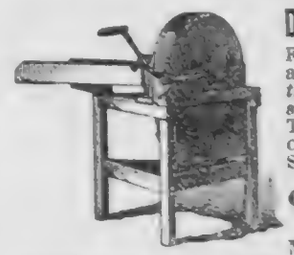
Hood's Sarsaparilla 100 Doses One Dollar

Do You Feel all tired out, nervous, irritable and without appetite? Hood's Sarsaparilla will overcome that tired feeling, tone your nervous system, purify your blood, sharpen your appetite, cure indigestion and sick-headache, and make you cheerful and happy. Be sure to get Hood's Sarsaparilla

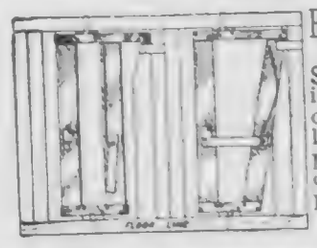
NOTHING ON EARTH WILL MAKE HENS LAY LIKE SHERIDAN'S CONDITION POWDER

Highly concentrated. Dose small. In quantity costs less than one-tenth cent a day per hen. Prevents and cures all diseases. If you can't get it, we send by mail post-paid, One pack. 25c. Five $1. 2 1-4 lb. can $1.20; 5 cans $5. Express paid. Testimonials free. Send stamps or cash. Farmers' Poultry Guide (price 25c.) free with $1.00 orders or more. I. S. JOHNSON & CO., Boston, Mass.



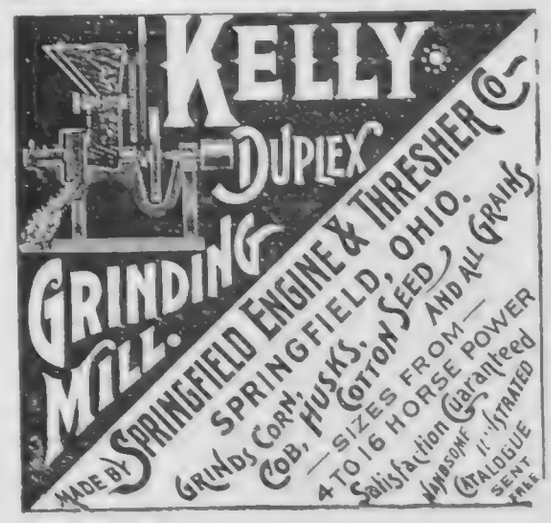
DICK'S FEED CUTTER

For Hay, Straw and Ensilage. *The only machine that cuts and splits corn stalks.* We also sell the TRIUMPH STEAM GENERATOR, and GRIFFING'S CORN SHELLER AND SEPARATOR. Write us at once **H. B Griffing, Sons & Co., 70 Cortlandt St., New York City. N. Y.**



BOON to DAIRYMEN

Perfect Swinging Cow Stanchion. Self-locking by entrance of cow's head. Free delivery at principal points. Send for circular. Mention this paper. **Scott & Locke, Orford, N. H.**



THE
RURAL NEW-YORKER,
(34 PARK ROW, NEW YORK),

A National Journal for Country and Suburban Homes.

Conducted by
ELBERT S. CARMAN.

SATURDAY, NOVEMBER 9, 1889.

NOTICE.

THE RURAL NEW-YORKER is invariably discontinued at the end of the term subscribed for. Any copies sent to non-subscribers are sent without charge as specimens merely.

THE judges have divided the list of prizes offered to the prize-takers in the R. N.-Y's. Women's National Potato Contest into 200 souvenirs. The amount of work involved in deciding as to whom the prizes shall be awarded is considerable and it will be several weeks before conclusions will be arrived at and the results published. A considerable number who have produced large yields have failed to append the necessary corroborative certificates.

OVER one thousand R. N.-Y. readers sent in their names as contestants in the Women's National Potato Contest, and 550 have sent in their reports.

A CABBAGE-GROWER near this city who has made a reputation for supplying extra good red cabbage, was asked for the secret of his success. He stated that the seed was of less importance than the location and environment of the plant. He said he always sows red beets all about his cabbages, and it is this that gives them their beautiful color. "That beats Jacob's cattle experiment all hollow," was the comment of a seedsman who heard this theory expounded.

ALMOST every week the daily papers contain advertisements of "sore" horses for sale. Last week a friend of the R. N.-Y. followed up one of these advertisements. He found 10 horses at the stable of the United States Express Company in Jersey City. They were all young animals of good color and breeding—easily worth $250 each if entirely sound. He was offered the entire lot for about $1,100. So far as he could judge, the horses were hoof-sore—there seemed to be nothing the matter with their legs. There was a good chance that a few months on bare ground, without shoes, would cure them of most of their lameness. Some farmers like to speculate with these "sore" horses, but unless a man is an excellent judge of a horse and something of a veterinary surgeon, there is a good deal of risk about the business. Buying from the express companies is much safer than buying from the horse railroads, because it is well known that the express people never buy poor horses.

THERE seems to be a great deal of nonsense connected with the business of testing milk. During the past week a milk-dealer of this city was tried before a jury for selling milk containing a lower per cent. of fat than was required by the regulations of the Board of Health. The chemist employed by the Health Board analyzed a sample taken from a certain can in a delivery wagon, by what he calls the Wanklin-Waller method, and found that it contained only 2.64 per cent. of fat, while the regulations say that milk must contain at least three per cent. The driver of the wagon testified that he took a sample of milk from the same can, which was examined by a chemist who had been employed by the United States Government and by the State Dairy Commissioner, and who testified that he analyzed it by the Adams method and found that it contained 3.08 per cent. of fat. He also stated that the State Dairy Commissioner had rejected the Wanklin-Waller method, and preferred the Adams as more accurate. There was no evidence to show that the milk had been adulterated or watered, but the assumption was that it had been skimmed. The accused was acquitted, and it is difficult to see how any other result could have been reached. Such trials as this may be needed to agitate the subject, but such contradictory results will tend to bring distrust upon all methods of analyses in the eyes of practical farmers.

EVEN if such a combination as that proposed at the Mississippi Valley Wheat Growers' Convention, could temporarily succeed in controlling the price and supply of wheat, long-headed farmers may ask would it not be likely to end in disaster to the American farmer? Wouldn't its chief beneficiaries be a handful of gamblers who are speculating for an artificial rise in prices in the bread market? The first effect of such a speculative combination would undoubtedly be to draw all the reserves of wheat out of the granaries of Russia, India, Australasia, Chili, Canada and other surplus-producing countries, and it is not at all unlikely that the manipulators of the scheme would soon discover that the stock of wheat in the world is considerably larger than they had imagined. The next effect of an attempt arbitrarily to raise the price of bread in this country would certainly be to extend the area of wheat production in other quarters of the globe, and by largely increasing the world's supply permanently lessen the dependence of consumers upon the American markets. There is no doubt that the present low prices of wheat are due, partly at least, to the impetus given to foreign production during recent years by the cornering operations of a few unscrupulous speculators in our markets. If the effects of the operations of a handful of middlemen have proved so injurious, what disasters may not be expected from similar operations practiced by a combination of a multitude of producers? It is well to think calmly and deliberately over the questions briefly suggested here, especially when discontent at low prices and strange projects for artificially bettering them are in the agricultural air.

$10.

THE R. N.-Y. offers a prize of 10 dollars for the best column of "Notes on a Back Number." Contestants may select any number of the R. N.-Y. for 1889. They are to write short notes in approval or criticism of the various topics discussed in that number. The articles must not be over one column in length. The prize is to be given to the column showing the most sense, and in which the greatest number of topics are discussed. It is proposed to publish all the essays in the form of a "Discussion" symposium.

GRAIN FOOD AND BUTTER.

CAN you add anything to the discussion of grain feeds for butter on page 739? This is a very interesting subject and is well worthy the attention of every dairyman. There appears to be a universal belief that corn-meal is the best grain food that can be given butter cows. During the past year the R. N.-Y. has tried quite a variety of grains, such as wheat and rye brans, "horse feed" oats and corn-meal. Our test for quality of butter is the opinion of the "dairymaid" who makes the butter without knowing what the cow has eaten. Nothing has been found to equal good corn-meal for making hard, firm, yellow butter. The difference between corn-meal butter and bran butter is to be seen at once. In our opinion, the better the cow the wider the difference and the quicker it is to be noticed. The point is raised in the discussion that corn-meal is not so good when fed while the cows are at pasture. The R. N.-Y., from its own experience, considers this point sound. While the cows have plenty of good, sweet grass, we would feed less corn-meal and more bran. As our readers know, the R. N.-Y. has been feeding a good deal of cabbage to dairy cows; with this cabbage we feed corn-meal just as we would feed it with clover hay. Mr. Newton's idea that the hay of the butter ration has a marked effect on the quality of the butter is well worth thinking over. "*A good hay feed combined with a poor grain feed will make a better quality of butter than a good grain feed combined with poor hay.*"

We believe that most dairymen will agree with this statement. It is most respectfully referred to the consideration of the farmers who think that corn-stalks and corn-meal are a perfect ration for dairy cows.

A VAST SCHEME AND ITS DRIFT.

A CONVENTION of over 200 delegates representing the wheat-growers of 17 States and Territories in the Mississippi Valley, began its sessions in St. Louis on October 23 under the auspices of the Farmers' Federation of Topeka, Kansas. The announced object of the meeting was to devise ways and means to obtain better prices for the wheat, and ultimately, doubtless, for the other products of the farmers of the vast valley extending from the Alleghanies to the Rocky Mountains and from the Canadian line to the Gulf. Those present disclaimed "any purpose of denouncing trusts or combines," or of forming one themselves. They simply sought to remedy existing conditions which force wheat-growers almost to give their crops away. They denied any wish to charge exorbitant prices for the cereal; they merely desired to regulate the supply to such an extent that the demand will not be so exceeded as to result in disastrous competition. "A good price for the products of the farm," exclaimed President Allen very truthfully, "means good times, the revival of business, more employment for labor and better pay, the improvement of railroads, fewer failures and the liquidation of mortgages."

"Realizing the individual feebleness" of farmers and "the great importance of unity of action as a class," the President urged farmers to delegate to a power of their own creation the exclusive right to market their products. The Farmers' Federation, with a projected capital of $20,000,000, three-fourths of which it is proposed shall rest forever in the care of trustees to secure farmers in control, offers itself as the embodiment of this power. It claims that before reaching the consumer the products of the farms of the Mississippi Valley are charged $10,000,000 paid annually as commissions to middlemen, and it proposes to do the whole business through a system of salaried agencies for $1,000,000 a year! Meanwhile the convention determined to "fix the minimum price that wheat shall be sold for in the Chicago market" during the current season. Farmers are urged not to sell for less; but, instead, to "corner the surplus of 120,000,000 bushels in their granaries and farms and to notify Mark Lane that it will not be sent forward until a price is offered that will justify exportation. This would," we are assured, "bring up the price of wheat in the home markets in all exporting countries."

Among the fine resolutions passed by the Convention one urged the making of "such reciprocity treaties with those foreign nations to which we ship our farm products as will cause" them to remove the customs duties from American agricultural imports, "thereby causing us to receive a higher price for our foreign farm surplus, and thereby fixing higher prices upon all we sell at home." Another resolution urged the repeal of all our duties on farm implements and on the raw materials used in making them.

Judging from the reports of the proceedings of the convention, that have reached us, the conclusion is inevitable that had it been packed by the concoctors of trusts in general and the advocates of unrestricted free trade, its action could hardly have been more favorable to the objects both of these classes have most at heart. The proposed scheme is, in reality, a gigantic trust, designed, like other trusts, to restrict production and raise the price of one or more products to consumers at home and abroad. Farmers are now the greatest sufferers from trusts and their most influential opponents; surely those engaged in a trust for controlling the prices of the necessaries of life throughout the world would be hardly in a position to make war upon minor trusts controlling matters of minor importance within a comparatively circumscribed area.

Again, farmers are the loudest and most influential opponents of the repeal or diminution of duties on raw materials, because their wool, sugar, etc., are in the shape of raw materials when they market them. With what face could they demand the abolition of duties on one or two particular kinds of raw materials for their own special pecuniary advantage while insisting on the imposition of heavy duties on other kinds of raw materials to the pecuniary disadvantage of the rest of the community? Again, the United Kingdom takes more than twice as much of our exported agricultural products than all other countries combined, and the United Kingdom imposes no import duty on any of them except on tobacco and intoxicants. In return for the abolition of taxes on the small imports of these few luxuries, are we to throw open all our ports to free trade in the multitudinous products of that vast workshop?

There is no intention whatever of raising here any question as to the wisdom of the policy advocated by the convention; we merely desire to state it and briefly suggest the drift of it in plain language so that every farmer in the country can clearly understand the matter. It may be time for farmers to change the policy most of them have hitherto followed with regard to trusts and the tariff; if so, no doubt this new scheme will receive a generous support.

BREVITIES.

READ what Prof. Budd says about dwarfing Lima beans, on page 742.

THE indications are that the pickle crop will be very light this year. The crop of cucumber seed is also light.

"I CALL a potato small when it comes under the size of a Plymouth Rock hen egg."
Clyde, Kan. A. G. W.

THE latest Government report places the average condition of potatoes as, with three exceptions, the lowest ever reported.

THE R. N.-Y. has a symposium coming on the best methods of growing, curing and handling the clover-seed crop, that will prove very interesting.

"I SAVED the smut from corn last year and put a handful in the hill at planting time. Every hill so treated showed symptoms of smut." See O. K. L., page 742.

THAT is an interesting article on the cost of living in Colorado, see page 742. How does it compare with the cost in your own family? If you have the figures, please let us know how they compare with these.

AN Iowa subscriber who enters for the "Notes on a Back Number Prize," writes: "Whether I receive the $10 or not, I feel that it is worth that much for a Granger to write essays on such diversified material as your paper contains."

FOXINESS in a grape is a quality that need hardly be considered nowadays in so far as market demands are concerned. The Niagara is, as generally grown, one of the foxiest of grapes and yet it meets with a readier sale than any other native white grape today.

THE R.N.-Y. is informed that cabbages are sent from Belgium to the London market at a cheaper rate than the English railroads charge for carrying the vegetable 50 miles. Cheap and rapid transit makes the Danish and Norwegian dairymen and the French gardener formidable rivals of the English farmer.

"I WOULD like to buy some of your State of Maine Potatoes because they look very much like the Rural New-Yorker No. 2" said a potato-grower not long since. "Brownell's Winner will suit me because it looks so much like the Early Rose that I can sell it for that potato," said a farmer. So it goes. How are you going to know that you are getting pure seed of desired varieties? This is bad business, folks.

"COME, boys, let's take a drink to begin the day on!" This remark came from a group of young men who followed the writer up the street from the ferry. The group soon disappeared inside a saloon. "I should not care to have that young fellow in my employ," was the remark made by a business man. "When a man gets into such a state that he must leave his work to get a drink, he ought to be watched—he's not trustworthy."

OF all the out-door games that the R. N.-Y. knows of, it would commend lawn-tennis to its readers, both male and female. The exertion required in a four-hand game is not necessarily laborious or violent, while it may be increased or lessened to suit the temperature whether it be warm or frosty. There is no tedious waiting, the turns coming in rapid succession. Again, it is not a game of chance; the most skillful couple will win in any extended series of games. It is an innocent, inspiring, social, healthful amusement.

Miscellaneous.

EXPERIENCES AND REFLECTIONS.

FRED. GRUNDY.

WE began using our celery the last week in August and have had it on the table every day since, and there is enough yet standing in the garden to last till the middle of January. Next week I shall prepare a trench eight inches wide and 14 inches deep, and when the first freezing cold spell comes along all that remains will go into it in a jiffy. When lifting the roots to be set in the trench I sink a pointed shovel about three inches from the plant, grasp it with one hand and bear down on the handle of the shovel with the other and out they come. A gentle rap of the root against the handle removes all superfluous earth and it is ready for the trench. In the trench it is packed moderately close, a little soil is thrown on it, the trench is covered with boards and straw, and it keeps finely.

In setting out my celery this season I tried a new plan. I wanted to set out something over 500 plants and all the ground then available was a strip 54 feet long by nine wide, so I set the plants six inches apart in rows two feet apart. The soil was already rich, but when the plants were set out I gave it a good dressing of well-rotted manure. The plants made a vigorous growth from the start, and as soon as they were large enough I began to blanch some of them by setting three-inch drain tiles over them. Twenty-five tiles were used, and when a plant was cut for use the tile was set over another, the outside stalks being broken off at the time. In this way we have kept the table steadily supplied without difficulty. I blanched part of one row with boards 12 inches wide, setting them on edge on either side of it and fastening them together with strips of lath. They were placed four inches apart at the bottom and two at the top and the celery between them blanched very nicely—better if anything than that in the tiles.

Next year I shall set my celery exactly as I did this year and on a spot especially enriched and prepared for it. That intended for early use I shall blanch with boards 12 feet long and 14 inches wide, setting the lower edges four inches apart and the upper 1½, and firmly fastening them together with short cross-pieces. When the sun shines hot, as it often does in the early fall, tiles get pretty warm and sometimes toast the celery inside, and for this reason boards are better at this time than tiles. When the weather gets cooler I shall use four-inch tile, because it is easier handled than boards. Celery blanched with boards or tile is much cleaner and nicer than that banked with earth. If I had to grow celery in rows four or five feet apart I should set out very little, and if I had laboriously to build a levee on either side of it to blanch it, I'd go without.

PLYMOUTH ROCKS are the leading breed of fowls in this section. They seem to fill the bill for an all-purpose fowl better than any other. Buyers of market poultry also appear to prefer them to any other breed and quickly snap them up, if fat, at the top prices. I notice that fanciers or breeders are assiduously cultivating the comb and wattles of this breed, and professional judges make a practice of awarding the premiums and prizes to cocks having combs sticking two or more inches above their heads and weighing half a pound or so. Now I have raised poultry quite a number of years, and I have learned that the less comb and wattles there are on them the better. My poultry house is much warmer than the average, and yet some of my fowls get their combs and wattles frozen every severe winter. A cock or hen that has its comb or wattles frozen is utterly worthless until the injury is entirely healed. The healing of a frozen comb requires from six weeks to two months, so if the freezing is done in February—as it most frequently is—any person possessed of a grain of common sense can see how the keeper of tall-combed fowls is handicapped. Farmers—especially those living in the Northern States—buying cocks for breeding purposes should not accept one having a comb over half an inch high. For each additional half-inch they should compel the breeder to deduct 20 per cent. from his regular price; if clipped 50 per cent. None but cranks of the most pronounced type would expect farmers to build hot-houses for their poultry merely for the purpose of protecting an utterly useless appendage from frost. At the St. Louis Fair I noticed that a professional judge had awarded the first premium to a Plymouth Rock with a comb like a section of a cross-cut saw, and wattles like a pair of saddle-bags. Off with such trumpery!

In the matter of refurnishing the interior of poultry houses for the winter, I would suggest that the old perches be brought down from their high estate and placed not over 18 inches above the floor. A fowl can roost just as comfortably on a low perch as on a high one, while it is very much easier to climb upon. The man who places the perches even with his nose or higher should be compelled to go to bed *via* the roof and chimney route until he learns better.

Christian County, Ill.

Woman's Work.

CONDUCTED BY EMILY LOUISE TAPLIN.

CHAT BY THE WAY.

BEAUTIFUL indeed are the furs for the coming winter. Long furs seem likely to hold sway; chiefly, no doubt, because the framing of soft hair is so becoming to a woman's face. The most fashionable will be sable, but this is only within reach of a wealthy purse. Black monkey, stone marten, lynx and bear are favorites; cinnamon bear is a very pretty and becoming fur. Apparently the long boas will again be worn, and there are many pretty cravats and collars. Flaring Medici collars of fur are seen on many new coats, and are eminently becoming. Another pretty thing is the rounded Russian collar, coming in a point to the waist. Fur capes, coming to the waist, have been worn more than ever this autumn, and they are very pretty and comfortable. The newer ones are not so much raised on the shoulders as they were. Black astrachan is very much worn in these capes, sometimes in combination with other fur.

* * *

WRAPS, as well as gowns, may be dated by their sleeves. Last year, you may remember, the long coats of the newest mode had either bell sleeves or a tight undersleeve with a flowing angel sleeve over it. This season the newest long coats seen are as tight as tight may be, like a redingote having a puffed sleeve, either the mousquetaire, which is a very wrinkly leg of mutton with the fullness pushed toward the top, or else they are made with one large puff coming below the elbow, finished by a deep velvet cuff. It certainly looks as if tight sleeves were entirely in the background, like the bustle. All the new gowns have just one short reed about 12 inches below the band, just to keep the skirt from hanging too heavily, and a little thin pad at the top is permissible, but this is all; the dress is expected to slope gradually without any protuberance. With the disappearance of heavy draperies, tight sleeves, and high heels, it does look as if fashion were becoming more sensible.

* * *

JUST think what a woman's paradise the wind-swept State of Kansas must be! The women have put Prohibition in the constitution; they have full municipal and school ballot, and co-education in the State University. Women are school commissioners, and treasurers of school boards, superintendents of schools, registers of deeds, and police justices. The Assistant Attorney General is a woman, and there are more woman preachers, doctors, lawyers, bankers, farmers, editors and merchants than in any other State. Truly woman's sphere must be in the State of Kansas.

* * *

Apropos of the Kansas women, the Atchison Globe speaks of the numerous decorations worn by the Atchison girl. It says that she wears a yellow ribbon because she is a suffragist, purple for the King's Daughters, blue for prohibition, and white for the White Cross Legion. Societies for all sorts of improvement, mental, moral and physical, seem greatly to occupy feminine attention in Kansas.

* * *

ONE is often at a loss in mending a much-prized piece of china when it is broken into several pieces which will not stay in position while drying. A writer in Harper's Bazar gives a very clever expedient for such difficulties. The idea originated with the possessor of a set of quaint little butter dishes, one of which was broken into five pieces. Every attempt to keep the pieces together until the cement hardened proved a failure. At last a bright idea struck the puzzled housekeeper. She took a large saucer, greased it with lard, and then mixing plaster-of-Paris and water to a thick cream she nearly filled the saucer with it. Soon it hardened to the consistency of putty. She then greased the convex side of an unbroken butter plate with lard, and pressed it into the plaster even with the upper rim of the plate. When the plaster had hardened still more she removed the plate, and there was an exact mould of it. Both saucer and plate were greased so that the plaster should not adhere. She then put cement on the pieces of the broken plate and fitted them into the mould, which held them firmly in place. The cement hardened, making a very creditable job. This idea will be found very useful in mending badly-broken pieces of china.

"WANTED: A YOUNG WOMAN OF GOOD ADDRESS."

BESIDES being an unappropriated blessing, I am a young woman of good address, to whom the advertisement quoted above might be supposed to apply. Like a traditional beau sabreur, all the world is mine oyster—but, alas! I've only a feeble pen to open it. Many struggles with the metaphorical but refractory oyster give the impression that an agreeable personality only is the feeblest tool one can possess, and yet it is the only one with which many women are furnished. We who belong to the great untrained are ready enough to do *something*—but what? Country girls of all classes—I am one of them myself, pushing along with pen and needle, both excellent tools for mediocrity to starve by. A well-trained woman with a specialty has little reason to fear starvation, unless the three grim spinners bear a grudge against her. The army of unfortunates is made up of the foolish virgins, who drift carelessly through school, acquiring a varied fund of useless information, and then dance through the first years of long skirts in daily expectation of the fairy prince.

Of course, we all feel sure mentally that we shall marry; we may have to struggle along for a few years, but some man of keen discrimination *must* finally realize our feminine perfections. In the mean time we must work, and herein lies the burden of our woes.

Most of us are ambitious, like the woman who recently wrote of her struggles to provide flounced petticoats and evening gowns on an income of nothing certain a year; though, to tell the truth, one has a haunting suspicion that if Thackeray had met this ingenious dame he would have given her a chapter to herself—in the "Book of Snobs." As a natural outcome of our ambitions, we don't want to drag on a restricted existence, subject to the rich man's contumely and the rich woman's unattainable bonnets. So we must go to a wider field—wider, indeed, in that it gives us more scope for drudgery.

The average young woman who possesses a home, but whose pocket-money must be represented by a minus sign, is always on the lookout for some means of adding to her income. So she eagerly scans the papers for advertisements of work to be done at home. She may find plenty of them—embroidery, knitting, crochet-work, and they all come to the same thing in the end—so much to be paid for "instructions," and so little for work, with sundry deductions for error. The advertiser is usually a man, who knows as much of crochet-work as he does of cuneiform hieroglyphics, but his spider-web is always well stocked with silly flies. Of course there are some legitimate concerns, where a woman without other means of support—God help her!—may make as much as the sewing women who do shop work.

An advertisement for "a young woman of good address; previous business knowledge unnecessary," usually means a canvasser of some sort. It may be for some article of women's or children's gear, or the latest invention to revolutionize kitchen work, or it may be some entirely superfluous publication. In any case the experience is similar. The palpitating young woman climbs a lofty range of stairs suggesting Avernus by their difficulty of ascent. She enters the office, where she is abstractedly welcomed by its presiding genius, whose flow of language suggests that he is a reformed book agent in disguise. If induced by this oratory to make a trial of the work, the applicant pays a moderate deposit on the samples she takes, and listens with high hopes to the ex-agent's stories of successful canvassers. He tells how Miss Blank makes 40 dollars a week and Mrs. Dash twice as much, and how Mesdames Blank and Dash regard the canvasser's life as the happiest lot on earth. The young woman who has good address but no business knowledge tries the work; if she is a born canvasser she sticks to it, and comes in time to regard it with the tolerant semi-liking we usually extend to our perfunctory breadwinning. If not, she takes a few rebuffs, and then returns her samples to the ex-agent, who is not nearly so entertaining on the second interview, and whose courtesy is distinctly strained when a request is made for the deposit. Doubtless there are women who make a good living as canvassers, but these fortunate sisters have the ability to make a living at anything they undertake.

Having tried these little outlets, the would-be breadwinner—no, not breadwinner—the foolish virgin settles down in her nest and spins cobwebs, like Mademoiselle Arachne. Her cobwebs may take the comparatively harmless form of art embroidery, but there is always danger of the literary fever. Every one writes nowadays, and aimless girls with no technical education and a certain amount of bookishness are very apt to drop into literature, much as Silas Wegg dropped into poetry. With most of them literature means poetry—or rather verse. The humble person who now addresses you speaks with feeling here. My first literary venture took the form of verse, and when that ill-freighted argosy returned, "declined with thanks," I thought that heartless editor was a lineal descendant of the reviewer who murdered Keats. Now I should like to publicly thank that noble man, in that he refrained from crucifying me in print as the writer of such ineffably feeble verselets. But we don't all look at it from this high moral standpoint. The return of a pet manuscript accompanied by that cold-blooded printed slip we all know so well, is usually the cause of heart-rending pangs, unless we are hardened to the point where we simply re-write the unappreciated infant of our fancy, and send it to try the soul of some other editor. Rejected manuscripts form a common ground whereon all writers meet; it is a professional incident falling on the just and unjust alike.

Since every one who knows anything, and many who do not, inform us that the writer's lot is not a happy one, it is hardly likely that a young woman who has failed at occupations less exacting should acquire ease by her pen. A good many of us have tried it, but as the Dowager Mrs. Gowan says, "it never does." A few little stories, perhaps, in those literary periodicals which talk superbly about encouraging budding genius, but which, viewed from a vulgar material standpoint, are exceedingly "poor pay"; a few "Hints to Mothers" or 'Talks to Graduates" in some domestic publications, and the slenderly-armed aspirant is finished.

To come down to common sense, a girl who is no more equipped for bread-winning than a soft-shelled crab, is entirely out of place in this competitive period. She has no means of livelihood except marrying—fortunately for us, and unfortunately for them, a great many men regard helplessness as true womanliness, so the incapables have quite as good a matrimonial opportunity as their more helpful sisters. But this does not obviate the absolute necessity for every woman to master a trade or profession, even where circumstances seem to render it needless.

Perhaps the industrial millennium would arrive sooner if we did not all seek so anxiously for "genteel" employments. Some of us certainly would be better off if we gave up poor clerical work, and feeble scribbling, and ineffective teaching to cook and sweep and sew. We might do good work in such capacities, but such is the inconsistency of human nature that we don't want to. Besant is right in thinking that few women care to work except for love. But sooner or later everything must find its level—even the women who advertise for "any employment not menial."

What do you expect to do, most patient reader, when this social revolution comes? This didactic writer may wield broom and duster as my lady's chambermaid—perchance may wear cap and apron, as the custodian of well-fed olive branches in Bryant Park or Madison Square. COTTAGE MAID.

HOME DRESS-MAKING.

OLIVE E. DANA.

IT is the season once more for changes and remodellings, and, let the impecunious rejoice, it is the season of seasons for home dress-making. Was there ever a time when Dame Fashion allowed such large latitude in the choice of fabric, style and ornamentation? Was there ever a time when the prevailing modes were so simple and so easily followed, and the effects so charming?

This is the time surely for one to make over one's old dresses, to combine old with new, and old with old into dainty gowns that shall delight both the wearer and the beholder. It is a comfort to most women, especially to home-keeping people, to have pretty and becoming dresses for home-wear. And they can be gotten up this year with little outlay.

Two or even three materials may be used, they tell us, in the same gown, and almost any sort of garniture one happens to have. These house-dresses admit, too, of almost unlimited piecing. There is such a variety of trimming used that it is very easy to conceal a seam. And even if it cannot be hidden, it shows very little on a woolen dress, if neatly sewed and pressed. Old basques or polonaises may be cut off at the belt to serve for plain waists. The draping may be re-adjusted in plaits or gathers at the back with little trouble. Shirring the front breadth of the skirt enables one to use short lengths, and plaitings, especially the fan-plaitings, allo v of narrow pieces.

Or an extra breadth or two, added to the old draperies, will usually make one of the full, plain, gathered or plaited skirts. A flannel thus planned, with a full, plain, broad-hemmed skirt, plaited into a binding and a plain or plaited waist with a broad belt is comfortable and convenient for house-wear in winter-time. Braid is a pretty garniture, if one chooses, on such a dress. The wide black braid formerly in vogue, is very suitable for use on dark-blue, green or gray flannel. Or such a dress is almost equally tasteful if only collar and cuffs, of the same or contrasting color, and perhaps fashioned from some laid-by bits of velvet, are added. Cashmere takes kindly to much shirring and smocking, and these serviceable accomplishments in needlework —which are not hard to acquire—give new freshness to old material.

For a street-gown one could not of course combine and piece so freely, and one would have to be more critical about the condition of the old goods. But there is much liberty as to mode and trimming as well as in the choice of goods. It is good news to women with light purses that dark colors will be most popular the coming season, and that cashmere is among the leading fabrics. Velvet, surah, and watered silk seem to be the favorite goods for trimming.

A pretty fall street suit lately noted was of dark-gray flannel, with plaited draperies and small round basque. Its chief garniture was formed of rows of narrow velvet ribbon, garnet, or, more accurately, cardinal in hue, which crossed cuffs, collar, and the simulated square neck in front. For cold days a jacket of the same material with the dress was worn. It had no trimming and fitted as everything does, tightly.

Stripes combine well with plain goods. To a navy-blue serge was lately added goods of the same color with a broad stripe of darkly-shaded gray running through it. The latter material forms the fan-plaited front of the skirt, the plastron,—which is loose at the top and laid in fine plaits lower down, —the sleeve-puffs, etc. The effect is most harmonious. Later it will be worn with a jacket of dark-blue beaver, with collar and sleeve trimmings of gray fur.

Home dress-making, whether of garments cut and fitted elsewhere, or wholly planned by the maker, demands painstaking attention to details.

It is very annoying to find one's basque one-sided—a defect almost hopeless—or the neck too high or too low, or the sleeves of unequal length after the dress was completed. All these matters require care, accuracy and patience, and to insure the best results, the experience which comes only by some practice. I think some good women do too little of such work, either because of lack of time, strength or inclination or perhaps because it seems a folly and a waste of time to "make over" very often. So some of us come to wear, at home at least, garments that are out of date and, quite likely, ugly, when a little application and ingenuity would quite transform them and us. And I cannot think time so spent is wasted.

What we appear to be has some subtle, re-acting influence upon what we are. To be, even in looks, some distance in the rear of the prevailing fashion, sorely weighs one who strives to be in more essential things abreast of the current.

And a woman is not womanly who does not wish and try to be attractive and comely, and capable, in her own way, of giving pleasure.

And she makes a mistake who dresses unfashionably or unbecomingly, who will not give due attention to little matters of toilet and etiquette, and relinquishes, thus, one prerogative of her womanhood, a mistake only less great and disastrous than hers who makes these things her supreme aim.

CLEANING GLOVES.

WE are indebted to the Detroit Free Press for some suggestions on this subject.

Gloves are an important consideration to women. Even those women who possess wealth sometimes find themselves so placed as to necessitate the cleaning of their gloves. To women who are compelled to economize the matter is of very considerable importance. Georgia Cayvan, the well-known actress, has gathered a treasury of useful knowledge in this direction, and in a recent conversation with a friend she did thus impart:

"You see, one needs so many gloves. There are not only those I wear on the street, but there is hardly a part I play that does not call for at least two or three pairs on the stage; but I have got hold of a recipe, given to me by a little old French lady, and now I clean them myself over and over again and make one or two pairs last me through one of those long runs of a play. I go to a chemist's shop and ask for a quart of deodorized benzine, one dram of sulphuric ether, one dram of chloroform, two drams of alcohol, and enough lavender water to make it delicately perfumed and pleasant. The clerk mixes that up for me properly, and when I get it home I pour about a cupful of it into the basin and wash the gloves in it. If I have been wearing them a long time and they are very black, I have ready prepared two bowls in both of which is some spirits of wine slightly perfumed with the lavender water. Through this I give them two rinsings, but if they are not very much soiled one rinsing will be sufficient. Then I lay them on a table, and with a piece of soft white flannel I rub them smooth, so that all the wrinkles from the washing disappear, and they become partially dry; after which I stretch a cord across the corner of my dressing-room, in the light, but out of the sun and wind, and on this I hang them and let them dry for 24 hours. If the gloves are very thin and not of the first quality I dry them on my hands, slipping them on and buttoning them, and then scrubbing them briskly with a dry flannel to quicken the process of drying them. But I don't think that pays; it takes too much time, and. no matter how careful one is, a cheap glove never looks well after it is cleaned. I think, on the whole, it is cheaper to throw them away, or rather, never to buy them."

GOLDEN GRAINS.

"GEORGE ELIOT" says that she wonders whether the subtle measuring of forces will ever come to measuring the force there would be in one beautiful woman whose mind was as noble as her face was beautiful—who made a man's passion for her rush in one current with all the great aims of his life.....

THE RURAL CALIFORNIAN says that we are apt to underrate the amount of executive ability and organizing capacity of the woman who thoroughly keeps a house, without making life a burden to all its other inmates. The well-ordered home, where cleanliness is the rule, and thrift and thoroughness are still united with liberty, always seems to exist of its own accord. Such a housekeeper as holds the helm there, however, is as rare as that perfect actor whose finished work conceals his art, and makes the play seem real.....

THE lack of order is the principal defect in every imperfectly kept home. System is the first important requisite. Necessity, comfort, luxury; these in their order should be considered and provided for. The same general style should prevail all throughout the house; not beginning with elegance in the parlor, to wind up with meager bareness in the boys' room.....

Domestic Economy

CONDUCTED BY MRS. AGNES E. M. CARMAN.

THE GOURD AS AN ARTICLE OF UTILITY AND GRACE.

THE gourd is a climber of remarkable growth and dense luxuriant foliage. Aside from these admirable qualities its fruit is useful as well as ornamental. Indeed, it can be made a thing of wondrous beauty and "a joy forever."

The varieties best adapted for decorative purposes are the Pear-shaped, Bottle-shaped, Orange and Dipper-shaped, and the Hercules Club. There are many other varieties of fanciful form, but these are the most practical. The variety known as "Chinese Loofa" must not be omitted for it is certainly worthy of mention. The interior of this gourd, when ripe, is a tough, fibrous mass which makes the best of bathing cloths. For this purpose it cannot be excelled. It is neither as rough as a brush nor as soft as a sponge. It is, to a limited extent, already an article of commerce.

The gourd, preparatory to decorating, must be fully matured before being picked. Better leave the fruit on the vine until the frost has turned the foliage. Then pick, and the only precaution to be observed is that they are carefully dried. This is most effectively done by laying and standing the gourds in a shallow pan of coarse sand,

Gothic Design in Red and Blue Oil Paint. Fig. 271.

which has been heated in the oven or in the sunlight. Turn them frequently that they may dry evenly. This drying process loosens the seeds and inner tissue which is shaken out of a hole cut where the stem was attached. With the aid of a little water all matter will readily come out.

Powder-Horn with Etched Scroll and Oiled. Fig. 272.

The gourd is now ready to be ornamented.

This is a vast field for ingenious taste and artistic fancy. The gourd may be painted black, coated with gum-copal varnish, and ornamented with a sprig of golden-rod or a cluster of black-eyed yellow daisies. A Grecian design in bronze and gilt is very effective on the black. Another way is to etch a scroll with a sharp-pointed knife, and finish by simply oiling. An antique or Japanese design is pretty painted in oil. The simplest decoration is to varnish, and before being allowed to dry sprinkle thoroughly with metal powder or diamond dust. Something really artistic is this: Paint a gourd a dull blue and decorate with a gothic design in Pompeyan red. This will prove rather intricate and tedious, but the result will amply repay the artist.

As to the use of the gourd: In southern countries it is quite general. They are converted into powder-horns, dippers, ladles, water-flasks, wine bottles, vinegar cruets, and even cups.

When intended for powder or a liquid a

Painted Black and Decorated in Bronze and Silver. Fig. 273.

wooden stopper is supplied. Filled with cologne or toilet water they are charming gifts.

The orange or pear-shaped gourd makes a dainty rose-jar. Cut through its widest part, and glue a strip of heavy paper to the edge of the under cup to prevent the upper from slipping off. Fill with spiced rose-leaves; or, if these are not to be had, fill with cotton heavily scented with sachet powder. This shape is also nice for a casket for small jewelry or buttons. The illustrations given explain themselves.

ANNA HINRICHS.

MAKING AND REMAKING DRESSES.

SHE is indeed a most fortunate woman who possesses the gift of invention and the habits of thrift and economy. Should she be in straightened circumstances these virtues are the fairy wand by whose aid she can manage to keep herself and her family well-dressed, self-respecting and entirely comfortable. Nowhere are system and order more essential than in domestic management. There are so many things pertaining thereto, which seem of little importance but which require to be constantly under the watchful eye of the mistress lest work accumulate and clog the wheels of its intricate machinery.

Many a woman of delicate health accomplishes an extraordinary amount of labor by being rigidly systematic and a thorough economizer of time. Our home journals have recently shown a most commendable purpose to give information in regard to the prevailing fashions in dress. This is well, yet every woman who attempts the making or the remaking of her own or her children's clothes should subscribe for a magazine devoted wholly to that work. Formerly these were mostly reprints of elaborate Paris fashions entirely unfitted to practical every-day life; but this is no longer so. There are now some which not only illustrate and describe all grades of dress but also give explicit information on all subjects pertaining to dress. Fashion, instead of being the mistress it too often is, can be made a most accommodating and efficient ally.

Miscellaneous Advertising.

When Baby was sick, we gave her Castoria,
When she was a Child, she cried for Castoria,
When she became Miss, she clung to Castoria,
When she had Children, she gave them Castoria

That woman is well-dressed, who is dressed appropriately for the time and place, as well as for her own circumstances in life. Even a strong, self-reliant woman feels more at her ease, and can better do herself justice when she knows her dress is not attracting attention by its *outre* appearance. How much more, then, is this felt by the timid, shrinking woman, who requires the most favorable environment to bring out the luster of her character. And this principle applies with equal force to children. I know the great tendency is to overdress our girls, yet I also know some excellent mothers who go to the other extreme and endeavor to impress upon their children's minds the idea that the old-fashioned theory—long ago exploded—"that it matters not how one looks," is true, and so are doing their susceptible, oversensitive children an irreparable wrong.

An instance recently came under my immediate observation, where a boy of 16 years of age, though a strong, sturdy, self-reliant and independent fellow, yet proved to be as sensitive at heart as a timid girl. His father had insisted, against his wishes, as a matter of economy, in purchasing him a frock coat for school, and when the child could endure it no longer, he confided, with apologies and blushes to the little mother that the sneers and jeers of his companions when he rose in the high school to answer the questions asked of him, were so cutting and confusing that he could not do himself justice in his studies. The world will soon enough knock off these sensitive corners without our assistance.

To the woman compelled to study economy and dress herself and her family on a small allowance, the purchasing of materials becomes of first importance. Almost without an exception, it will be found most satisfactory to buy the best materials possible. It costs no more for lining and making a good, all-wool dress that will do excellent service for two seasons, and which can then be cut over for a child, than for a half-cotton one which will be faded and vulgar-looking before one season is half over. Very many goods which are needed annually or semi-annually in a family, such as standard cotton goods and all such as comes under the head of "notions," can be very advantageously bought at wholesale of a jobbing house, and all materials should be purchased of large dealers. Shopping by mail is now so easy that the dweller in the most remote country town need never be compelled to pay country merchants such exorbitant prices as they usually ask on all but standard goods. Illustrated catalogues and samples of all kinds of goods are freely sent out, and one can thus deliberately compare the different kinds of goods and select exactly what she wants and be sure that the order will be carefully filled.

There are also great opportunities for saving in buying goods after the hight of the season is over, as our merchants are fast learning that to dispose of their surplus stock cheaply is far preferable to letting the goods accumulate. For a trifling sum many a remnant of fine goods can be secured, which, in the form of collar, cuffs, vest and panel, will liven up many an old dress and make it really handsome. It used to be often advisable to have a dress nicely fitted by a professional maker, when making it yourself; but patterns can now be obtained which are so reliable as to fit any style, and so definitely explained, as to cut and make, that this is seldom now resorted to. In the hands of an ingenious woman, one of these patterns is capable of an almost unlimited amount of changing, so that several suits can oftentimes be made with but one pattern. Care should always be used in placing the patterns properly on the goods: all are plainly marked in this respect, and nothing stamps your work as unprofessional and bungling sooner than lack of careful attention to this point.

It is good economy to get a yard more than is needed for a dress, as one almost invariably wishes to remodel it. But if you ever have fears about the quantity of cloth for a garment, lay it down and carefully place each part of the pattern as it must go, before putting your shears to the cloth. A fine and firm quality of silesia is preferable to a coarse, heavy one for waist and sleeve linings, and the former should be cut cross-wise of the goods, as this will prevent any stretching—and cause the garment to retain its shape much better.

Do not be tempted with making a sham skirt for any new dress, unless it is a heavy cloth one, and should be very careful that by no possibility will it show. Many a costume which looked well when draped indoors, has, when subjected to out-of-door breezes, had its beauty totally spoiled by the sight of a contrasting "sham."

A skirt form for draping over is one of the most efficient aids to home dress-making, as it relieves one person, and often two, of a hard, nervous strain. Sensible women of abundant means consider it wiser to have but few dresses at one time, and to wear them out while in style, thus often having fewer in number than many a village maiden thinks essential for her wardrobe.

Because ultra fashionable people who have both the time and means for such wasteful extravagance, are again endeavoring to make trains stylish for the street, do not be enticed into making your one garment with such an appendage. Neither make an ample train on your simple tea gown, which must be worn on going into the kitchen, "up stairs and down stairs and in my ladies' chamber," because your wealthy friend K-s was beautiful in a dress of that style. Though old and trite the advice, I must reiterate it—a nice quality of black silk is preferable to anything else for the *one* nice dress; for by the aid of trimmings and lingerie it can be made to do duty as full dress, semi-dress, or elegant simplicity.

In the remaking of dresses careful attention to details is, if possible, more essential to success than when making new ones. All garments should be carefully ripped apart and the stitches be taken out; then each must be either sponged or washed—and smoothly ironed. Sometimes, however the material is perfectly good, and requires only to be larger or smaller, longer or shorter and so on. A sleeve too tight at the shoulder may be made comfortable by inserting a V-shaped gore, either plain or puffed, of similar or of contrasting material, and covering the seam with cord—gimp, etc. Sleeves that are short may be lengthened by piecing out the lining, and covering it with a plain or fancy cuff, or a puff of silk above a narrow wrist-band. A sleeve that is worn only at the elbow can be cut apart an inch or two and the worn-piece taken out and a bias puff inserted of similar or contrasting material. Skirts may be lengthened from the top and covered by draperies; if the breadths are gored, each must be ripped apart, pieced down separately and then trimmed off and the different parts sewed together again. Children's skirts can often be lengthened by the addition of a flounce at the bottom or by setting in a band of insertion. A rent or a soil in a skirt can often be effectually covered by changing the style of the drapery somewhat or by covering with ribbons, braids, gimp, etc., etc.

Waists can often be made larger by inserting a V-shaped piece in the center of the back, after piecing out the lining, and a garment of wash goods is handsome made of all over embroidery. The same thing may be done in the front by piecing out the lining and then covering with a fancy vest of the desired width. The odd effect produced by trimming the fronts of a basque unlike are not only stylish but sometimes a convenience in cutting out.

It is even more essential when cutting over an old dress than with new goods that one should carefully make her plans before commencing operations. By the exercise of ingenuity and good taste, two old dresses can often be combined in one new one with great success and at a very trifling cost. The domestic dyes are easily and successfully used and will freshen up many a faded garment so as to look almost new.

Nearly all colors will dye some shade of brown, and the different shades of blue make handsome greens when dipped in a yellow dye; drabs and light grays make handsome dark shades of red. In short, a great amount of satisfaction can be obtained both in the dyeing and remaking of dresses, painstaking attention to details being the price of success.

KATHERINE B. J.

A QUESTION.

MISS S— and I were discussing Mrs. C—'s little girl, a pretty creature of three years, and Miss S— said:

"I don't think her mother is doing right. She is always saying: 'Speak lower, Cora,' and she never allows her to laugh or shout aloud at her play. I don't think it is good for a child's lungs never to use them in making loud noises." Now, the little girl is a delicate child who takes cold very easily, though her careful mother dresses her sensibly. Will some one who knows, tell us who prize a low voice, whether we are injuring our little one's health to secure it?

MRS. LEVI NILES.

NOT PLEASED WITH CHARITY; CLEANING A SEWING MACHINE.

I AM glad that some one has protested against Charity Sweetheart's tirades. I rather enjoyed reading her letters at first, though I did not necessarily believe that all those experiences happened to one person, and that that person would make them public. But afterwards I wondered at the R. N.-Y. for publishing such nonsense. I would not expect much kindness from my brother if I should make his faults public in that fashion, and he would be pretty apt to remind me that I had faults as well as he. It naturally makes us all a little indignant to have any one who pretends to have such refined tastes forget the common rule of doing as we would be done by to those who have the first claim for consideration from us.

I would like to tell the RURAL readers how I clean my sewing machine. I have a wide-mouthed bottle in which I keep kerosene and a mucilage brush to apply it with. Of course all know that the kerosene must be wiped off after it has been thoroughly run in, and sperm oil applied. But the idea is that by keeping the bottle and brush for that very purpose, it is so much handier than going to the can and getting a little in a dish every time the machine needs cleaning.

EMMA L. BLISS.

CLARA'S ORANGE PUDDING.

TAKE four good-sized oranges, peel, seed and cut into small pieces. Sprinkle a cup of sugar over the pieces and let stand. Into a quart of nearly boiling milk stir two table-spoonfuls of cornstarch mixed with a little water and the beaten yelks of three eggs. Let cook for a few minutes, careful not to burn. When cool (you must beat it up from time to time) pour over the oranges. Make a frosting of the whites of eggs beaten and a half cup of sugar, and spread over the top of the pudding. Place in the oven for a few minutes to brown.

AUNT ELIZA'S JUMBLES.

FIVE EGGS, two cups of sugar, one and a-half cup of butter. Prepared flour to make a soft dough. Flavor with lemon or vanilla.

MRS. KATIE HOPPER.

VERY OFTEN

Life has been saved by a bottle of

AYER'S Cherry Pectoral

The best emergency medicine, it should be within reach of every one, young and old.

"Several years ago, on a passage home from California, by water, I contracted so severe a cold that for some days I was confined to my state-room, and a physician on board considered my life in danger. Happening to have a bottle of Ayer's Cherry Pectoral, I used it freely, and my lungs were soon restored to a sound and healthy condition. Since then I have invariably used and recommended this preparation, and always with beneficial results."—J. B. Chandler, Junction, Va.

Prepared by Dr. J. C. Ayer & Co., Lowell, Mass. Price $1. Six bottles, $5. Worth $5 a bottle.

W. R. & CO'S IMPROVED BUTTER COLOR

IF YOU REALLY WISH to use the very best Butter Color ever made; one that never turns rancid, always gives a bright, natural color, and will not color the buttermilk, ask for *Wells, Richardson & Co's*, and take no other. Sold everywhere. More of it Used than of all other makes combined. Send for our valuable circulars. WELLS, RICHARDSON & Co., Burlington, Vt.

Ice Cream at Home.

Made cheaply and quickly by using a Triple Motion.

White Mountain Freezer.

Will freeze in half the time of any other Freezer and produce Cream of the finest quality.

White Mountain Freezer Co., 134 Hollis St., Nashua, N.H.

SALESMEN WANTED AT ONCE.—A few good men to sell our goods by sample to the wholesale and retail trade. We are the largest manufacturers in our line in the world. Liberal salary paid. Permanent position. Money advanced for wages, advertising, etc. For full terms address Centennial Mfg. Co., Chicago, Ill., or Cincinnati, O.

I WISH the address of ladies afflicted with SUPERFLUOUS HAIR. Two-cent stamp. Mrs. Dr. M. E. Freeman, 99 Stanford Street Boston Mass.

Cook your POTATOES with the **PROFIT FARM BOILER**

With Dumping Caldron, empties its kettle in one minute. The simplest and best arrangement for cooking food for stock. Also make **Dairy and Laundry Stoves, Water and Steam Jacket Kettles, Hog Scalders, Caldrons, Etc.** Send for circulars. D. R. SPERRY & CO. BATAVIA, ILL.

AGENTS LOOK HERE and **Farmers** with no experience make **$2.50 an hour** during spare time. A. D. BATES, 164 W. Robbins Ave., Covington, Ky., made **$21 one day, $81 one week.** So can you. **Proofs and catalogue free.** J. E. SHEPARD & Co., Cincinnati, O.

Who (if your druggist does not keep them) will mail Beecham's Pills on receipt of price—*but inquire first.* (Please mention this paper.)

News of the Week.

HOME NEWS.

SATURDAY, November 2, 1889.

THE Weldon extradition treaty with Canada will not be promulgated until the United States Senate shall have acted on the extradition treaty made some time ago between the United States and England.... ....Gen. Raum, the new Pension Commissioner appears hitherto to have caused no complaints anywhere—he has done nothing.....
It is feared that Judge Cooley will be unable ever to resume his work as chairman of the Interstate Commerce Commission. His trouble is from paralysis, whose symptoms have continued to increase since he reached home. It will be hard to find as good a man for the place.....
The destitution in North and South Dakota on account of the failure of crops is reported to be wide-spread. It is estimated by some that 20,000 families are in want, and the relief committee are doing their best to meet the needs of the sufferers, but so far the contributions received are inadequate. The distress is greatest in Ramsey and Niloo Counties. The story about 100,000 starving settlers is declared to be an exaggeration, however.....
The rifle news from the South is rather scant just now. True, in Harlan County, Ky., the feud between the Howards and Turners is still raging fiercely. Yesterday came a report that the law-and-order party, under Judge Lewis, had just killed six of the Howards; but both parties were receiving reinforcements and the struggle was still doubtful. Harlan County is strongly Republican and the Democratic State government is said to be slow in interfering in hopes that both factions may wipe each other out.....Gen. F. E. Spinner, instead of dying of cancer, is now in fair health, and writing a book at the age of 88.....An English syndicate is to build a bridge over the St. Lawrence River at Quebec, and also a railroad from Quebec to Belle Isle.....
Postmaster-General Wanamaker has just promulgated the rates the Government will pay for telegraph service during the current year. It averages 33 per cent. less than the old rates, and the Western Union hasn't yet decided what to do in the matter.....
The "Cronin" trial drags slowly along at Chicago; things look bad for the accused, however, so far.....As regards the World's Fair, New York has already raised over $2,000,000 of the $5,000,000 Guarantee Fund voted for by the Finance Committee, and contributions are coming in at the rate of about $250,000 a day. There's a great deal of grumbling yet at the possibility of a part of Central Park being taken and some refuse to contribute till all intention of doing so is disclaimed. Some of the owners of the land wanted for the site are asking extortionate terms, and matters are not at all in a splendid shape. Chicago has her Fair matters in precisely that condition, having already a Guarantee Fund of $8,000,000. She is still working intelligently unanimously and enthusiastically to secure Congressional support in her favor. St. Louis is, as usual, quiet and a trifle lethargic. Washington, always powerful in social influences on Congressmen, has just projected a gorgeous banquet in support of her claims and will henceforth act energetically—for Washington.....
Secretary Noble has notified the cattle syndicate who have leased the Cherokee Strip that they must vacate the whole territory by June 1. If the Cherokees refuse the Government's offer of $7,200,000 for the 6,000,000 acres in the land, they can get nothing henceforth from outsiders. Intending settlers are reported to have set fire to the grass, and the cattle on hundreds of miles of blackened pastures are starving..... .....The price of oysters has reached the highest figure ever known in most of the seaboard markets—storms and a "combine".....This is an "off" year in politics through most of the country; but, Gracious! how hotly they're whooping things up in Virginia. Both sides are quite sure of victory; and all sorts of roorbacks are as thick as leaves in Vallambrosa. Politics in Ohio, too, are sizzling.....
Clement Garrett Morgan, colored, ex-barber, ex-school-teacher and ex-hotel-waiter, was elected to the unique honor of class orator at Harvard University the other day by a majority of one in a total vote of 250. He appears to be a very intelligent, well-educated, gentlemanly man, who has struggled nobly to secure an education. Of course, the kid-gloved Bloods and Swells who have hitherto run the annual elections are considerably disgruntled.....Ex-President Rutherford B. Hayes has been re-elected Commander-in-Chief of the Royal Legion which convened at Philadelphia the other day.....Senator Vest has fully recovered from his recent illness.... ...Senator Randall is again in fair health.....
The Pan-American junketers are having a truly halcyon and hilarious time of it, and have telegraphed Secretary Blaine that they've not tired of their trip as reported, but want lots more of it. The Pacific coast claims that it ought to be visited, as it is nearer to all the South American Pacific States than any other part of the country.....Canada is to have a sub-Atlantic cable of its own, which is to be laid next year by a company with a capital of $1,600,000. It will cost less than any cable hitherto laid, 'tis said, though it will have all "the latest improvements."
The Sandwich Islands appear to be anxious to have their relations with the United States more intimate than they are at present, and hence ask for closer commercial relations, promising not to negotiate treaties with any other country without the knowledge of the Government of the United States.....The mine-owners of Victoria, British Columbia, want to be annexed to the United States.....Alabama State four-per-cent. bonds sold the other day at a premium. A few years ago her eight-per-cent. bonds found slow sale at 70 cents on the dollar. Good for Alabama! .....Mexico has just shown its anxiety for reciprocity by imposing prohibitory duties on imports of live cattle and dressed meat. This is following the example of the United States, however, and imitation is surely a compliment.....
The land rings in New Mexico are jubilant at the recent removal of their implacable foe, the Hon. ex-Congressman, Geo. W. Julian, of Indiana, who for four years has been Surveyor General of New Mexico..... .....English capitalists are said to be negotiating with many of the most important cheese factories to form a Cheese Trust.....Buffalo and other "border" towns complain that Canadian workmen cross the line every day and work at "cut" rates.....
Contracts will be given out by the Government in a few weeks for the construction of 30 twin-screw sea-going torpedo boats, and a company of New York, New Haven and Philadelphia capitalists, with a capital of $6,000,000, has been formed to build them. They'll be quite formidable in size, speed and equipment.....An English syndicate has at last gobbled up all the St. Louis breweries, except one, for $12,350,000!.....
In 1840 William Parger sold a pair of mules for 28 acres of land on the Missouri near Kansas City. Changes in the river bed since then have increased the tract to 260 acres, worth $200,000, and the title to the increase has just been affirmed by the courts in favor of Parger's widow.....That Cadwell-Murat marriage was declared "off" last Friday. The cool-headed-and-hearted American girl offered $10,000 a year for the princely great-grandson of the old French inn-keeper; but he thought himself worth more, especially as his son's rich wife offered him the same sum for not marrying at all, as she didn't want a ranking lady in the family.....C. P. Huntington's adopted daughter, Miss Prentice, niece of the multi-millionaire's wife, has clinched the bargain with the German Prince Hardzfeldt, having married him last Monday. Cash consideration not yet mentioned.
A Snell-murderer Tascott has been discovered simultaneously in Philadelphia and Colorado during the week, and neither has proved to be the eagerly sought Simon Pure, to the $50,000 disappointment of their captors who hoped to get the big reward.. .....The Westinghouse Electric Company, which uses several million pounds of copper yearly in its electric works, will mine its own copper in future, having bought valuable mines in Arizona.....A letter written to the N. Y. World dated Florence, Italy, October 12, states that the reason Mr. Blaine declined to be a candidate for President last year in his famous Florence letter was that he had a stroke of paralysis at Milan, and subsequently was dangerously ill with paresis at Florence for several weeks. His sickness was followed by melancholia. It is generally believed there's truth in the report, and as the Plumed Knight is now all right he may enter the lists at the next Presidential tourney.....
The Mennonite colonists are doing remarkably well in the Canadian Northwest, where many of them have been settled for 14 years, and are now worth $10,000 to $20,000 each. Fresh immigration is expected. In this country, too, Mennonites are prospering wherever they have settled, as they are extremely frugal, industrious and economical.....
President Harrison has appointed November 28 as Thanksgiving Day.....Survivors of the wrecked steamer Earnmoor say that the boat's crew sustained life by cannibalism.....Major E. A. Burke, ex-Controller of the State of Louisiana, instead of returning at once to "vindicate" himself from the charges of having misappropriated hundreds of thousands of dollars entrusted to his care, has fled from England to Belgium to avoid extradition, as a number of indictments for forgery, etc., have been found against him in New Orleans. No man in the country had a higher reputation for honesty, honor and executive business ability than had Burke a few years ago.....

FOREIGN NEWS.

SATURDAY, November 2, 1889.

THE EMPEROR WILLIAM escorted by the German and English fleets, after his sister's wedding, steamed from Athens to Constantinople, on a visit to the Sultan. His reception has been grand. Bismarck is anxious to form, supplementary to the Triple Alliance, another "Alliance of Peace," embracing England, Turkey and perhaps Spain, and the Emperor's visit to the Porte will no doubt tend to secure Turkey's adhesion. Meanwhile Russia is unusually quiet, waiting perhaps to see how Bismarck will carry out his recent arrangements with the Czar. Peace appears assured until spring at any rate.....
In England the Parnell Commission has again begun its sessions, but little or no interest is now felt in its action. That it will make some sort of a report adverse to the accused is a foregone conclusion, but it will fall flat on the public attention..... ....Russia is just now on extraordinarily friendly terms with the Pope and has conceded all his demands with regard to the appointment of Catholic bishops and the government of the Catholic churches in Holy Russia. No doubt Italy's adhesion to the Triple Alliance makes Russia all the more cordial with the Vatican.....
Latest reports from two independent sources in Africa say that Stanley and Emin Pasha will soon arrive at Mpwapa, 150 miles inland from Zanzibar.....
The Prince of Wales is reported to be suffering incurably from Bright's disease. Two years is the longest span the doctors are said to give him. The London papers are requested not to discuss the topic.....
It is reported that the Czarevitch has been betrothed to Princess Marie of Greece, and Prince Ferdinand of Bulgaria to Princess Louise of Alencon belonging to the Orleans family.....
The marriage of Princess Sophie, sister of the Emperor of Germany, and the Duke of Sparta, Crown Prince of Greece, celebrated at Athens, last Sunday, was the most brilliant wedding that has probably ever occurred. No fewer than 99 "royalties" or members of royal families, were present, including the Emperor, Empress and Dowager Empress of Germany, the King and Queen of Denmark, and of course those of Greece, and the Queen and Crown Prince of Italy, the Crown Prince of Russia, the Prince and Princess of Wales, and "any number" of German princes and Grand Dukes and other "royal" notabilities. Owing to the remarkably good fortune of the royal family of Denmark, close relationship exists between several of the most powerful royal houses of Europe. One daughter is Empress of Russia, another Princess of Wales, and another a member of the Orleans family, while a son is now King of Greece, and another would probably have been Prince of Bulgaria were it not for the political complications to which such an election would have given rise. The presents to the "happy couple" were numerous, rich and gorgeous.....
Official statistics show that 32,000 Irish laborers migrate to England every summer to take part in the harvest work, returning home before winter. Five-sixths of them are supplied by Connaught....The straight-out Boulangerists assure the General of the fidelity of the party to his cause and of their confidence in his ultimate success. It is said that he will suddenly enter France and demand a new trial. If he does he'll be probably imprisoned to serve out the penalty imposed at the last.....Owing to an increase of the German forces on the Northern frontier of France, the French government will send 100,000 more troops in that direction. Every move of one power on the military chess-board of Europe, is certain to cause a counter-move by another.....

AGRICULTURAL NEWS.

SATURDAY, November 2, 1889.

THE Western Economic Association having headquarters at St. Louis, has adopted resolutions calling upon the Secretary of the Interior, and upon Congress to take the proper action to include in the next census statistics showing what percentage of the people in this country occupy their own farms and homes and what proportion are tenants; also as to what proportion of those who own their own farms have their property free from debt, and what percentage of the value is mortgaged. The act authorizing the census did not authorize the collecting of these and similar data, and a special act will be necessary to enable these very important items to be included. There is no doubt but farm property is greatly overtaxed, as well as heavily mortgaged, and one long step in the matter of securing relief is to have the facts collected and published to the world. Let the light shine!.....
The Vermont Dairymen's Association will hold its 20th annual meeting at the Town Hall, Rutland, Vermont, January 15, 16 and 17, 1890. The much-talked-about butter extractor will be exhibited. Speakers of National reputation on dairy matters will give addresses. Premiums to the amount of $200 will be paid on butter and cheese. A programme will be issued in December. E. L. Bass, secretary, West Randolph.....
There will be an auction sale of Jersey and Holstein cattle at the American Horse Exchange, Thursday, November 14. The animals offered are from several noted herds. .....It is reported that a man pretending to represent Philadelphia commission merchants has been swindling the cranberry growers about Barnegat, N. J. His game was to negotiate for the crop, and then borrow small sums of money on the strength of the deal.....
Reports show a lack of pasturage in many of the Western States, on account of the drought, Illinois, Wisconsin and Minnesota suffering most.....Nebraskan farmers have decided to organize a beef-packing house at West Lincoln, for the purpose of supplying the home market. They are confident of being able to cope successfully with the Beef Trust.....Judge Arthur T. Reeve, formerly of Iowa, Chief of the Seed Division of the Department of Agriculture, died in Washington on Friday of last week.....The squaw men are reported to have settled on all the land for miles around Fort Pierre, S. D., and trouble is anticipated from intending settlers who claim that the Government has decided squaw men no better than other whites....
The Secretary of Agriculture issued the following order to managers and agents of railroad transportation companies which took effect November 1: The order of July 3, 1889, prescribing regulations for the transportation of Texas and other Southern cattle and for the isolation, cleaning and disinfection of pens which had been occupied by such cattle is hereby revoked. It is believed that the danger from splenetic or Texas fever has passed for the present year.
.....A meeting of the hay-dealers of Quebec, Canada, who have claims against the United States Government for the refunding of duties, is called for St. John, November 5. It is said that the claims amount to over $800,000.....Growers and shippers of California grapes claim great things for the irrigated vineyards. They yield better of larger, sweeter, better flavored and more highly and uniformly colored clusters. The shippers say that the fruit grown upon irrigated land also carries better than any other.....
Farmers' institutes will be held in New York State the coming fall and winter as follows:

Crops & Markets.

SATURDAY, November 2, 1889.

WE are constantly in receipt of inquiries from friends asking our advice as to the advisability of selling or holding certain products, and as to prospective prices. While the R. N.-Y. is willing and anxious to furnish all the information obtainable, it must be excused from giving advice relative to the disposal of produce. Left to the unobstructed working of the natural laws of supply and demand, it would be comparatively easy to foretell the approximate prices of staple farm products. Knowing the usual consumptive demand, the amount on hand, and the probable supply, it becomes a very simple problem. But there are many things to disturb the equilibrium of trade, to which we have before referred in these columns, such as the operations of the gamblers in produce, the supply of certain products from unusual and unexpected quarters, the unreliability of furnished reports, and, sometimes the occurrence of destructive calamity, like the potato blight, untimely frosts, or a watery deluge. These and other similar conditions make it extremely problematical as to the wisest course to pursue in regard to holding or marketing crops. For example, one subscriber writes us that he has a car-load of potatoes, that he can sell them for 35 cents at his railroad station, but he thinks it is not enough. He asks whether he had better sell, ship them himself, or store them until spring. Let us do a little figuring. New York State and Western potatoes are quoted to-day at from $1.25 to $1.75 according to variety and quality, Rose and Hebron bringing higher prices, and Burbanks and Stars, lower. Supposing our friend ships his potatoes to a commission merchant in this city; he must pay five cents per barrel cartage; five per cent. commission for selling, besides transportation charges, and the chance is that his potatoes which he thinks the finest ever grown will be graded perhaps about medium, and sell accordingly. Then there is some risk from shrinkage, etc. But, suppose our inquirer concludes to store his potatoes until spring. We think no one who has had experience in handling potatoes will deny that under ordinary conditions, 35 cents per bushel in the fall right from the field, is as good as, or better than 50 cents in the spring. Is there a probability of the price being enough higher to warrant storing them? The day is past when excessively high prices may be expected in spring. The new crops from Bermuda and the South are put down here so early and so cheaply, and foreign potatoes are brought here at freight rates that will barely pay the cost of handling, whenever the price is likely to be moderately high, that only fair prices can be counted on. These remarks will also apply to many other products. Our own impression is that the man who has good potatoes or onions, and has facilities for storing them safely, will not lose anything by so doing. The Government crop report for October places the potato crop about eight or nine points lower than one year ago. We believe that potatoes will be worth considerably more money at some time between now and spring than they are now, but this is simply an opinion, and must be taken at its face value.

THE CUBAN crop of sugar promises well, and stocks on hand are nearly 20 per cent. heavier than last year.

BUTTER of the best grades is active, and in good demand. Lower grades are dull, and the market is overstocked.

BEANS have probably reached about the top notch in price. New lots arriving are of poor quality, and large arrivals of foreign will prevent any extravagant prices.

EGGS are advancing for strictly fresh, prime, clean stock. Limed, held, and ice-house show little improvement.

FRUITS show little change, except that choice grapes are somewhat higher. The auction sales of California and Eastern fruits continue, and several lots of Florida oranges have been disposed of at satisfactory prices. Mr. Goodsell has obtained for California fruit the highest prices ever realized in the United States. As high as $6 was received for a single crate of 20 pounds of Morocco Grapes, while a car-load averaged 15 cents per pound. Concord Grapes shipped by the Chautauqua Grape Growers' Association sold for 31 and 32 cents per nine-pound basket, and the manager of this association says that this method has brought them more money than any other, and they have shipped 100 cars. He says: "We begin to think that this is the proper way to sell grapes." The R. N.-Y. was the first to publish a full account of this system of selling fruits, and the confidence then expressed in the system has been strengthened by the results of recent sales

LATEST WHOLESALE PRICES

Literary.

MAGAZINE REVIEWS.

HARPERS contains a very bright, readable article from that indefatigable student of nature, W. Hamilton Gibson, entitled "Bird Notes." It is wonderful how many and what varied notes the trained ear distinguishes in the songs of birds where the unobserving hear nothing but a meaningless chatter. Mr. Gibson gives a long list of birds which he is able to identify by their songs, which he can hear in a June morning. Here is how he describes the flight of a familiar bird: "Why this brief vision of golden filigree that seems suddenly flung across my fancy? What is the talisman? 'I've cheated ye, per chick o pee, per chick o pee!' What but the tiny goldfinch that has passed overhead in its looping flight, festooning the ether in glancing drapery of black and gold, each embroidered loop pinned with a wisp of song." Isn't that a beautiful picture? And how many of the notes here given carry us back to rural scenes and country fields and we seem to hear repeated the well-remembered notes of the bobolink, the meadow lark, the robin and many other familiar friends of our younger days. Thomas A. Janvier gives an illustrated article, "The Mexican Army," which describes the organization of the military forces and explains how President Diaz has created "an orderly, well-disciplined, trustworthy" military force loyal to the nation out of a mass of scattered commands faithful only to their respective generals. He considers this development as full of significance for the future of Mexico. Another article of peculiar interest at this time when representatives of the South American Republics are traveling in our country is "The Republic of Columbia," by Hon. Ricardo Becerra. The resources of the country are wonderful in the way of valuable woods, minerals, etc. Owing to certain causes these have been but little developed. The foreign commerce amounts to $30,000,000 annually, of which about one-third is the product of her trade with the United States. Her imports from this country are about $5,000,000: chiefly flour, lard and other articles of food; hardware, machinery, oil, cotton fabrics, etc. There are no large fortunes, and in some parts of the republic every laborer owns his house and plot of ground, together with several head of cattle and mules. "At Grande Anse" gives some vivid impressions of the sights on the island of Martinique. "A Century of Hamlet" by Laurence Hutton, gives a history of the presentation of this character in New York, from the first appearance of the younger Lewis Hallam, November 26, 1761, to the time when Edwin Booth assumed the same part, November 26, 1861. Portraits and notices are given of the different noted actors who have played this part during the intervening time. There are other interesting articles, poems, the usual editorial departments, etc. Harper & Brothers, New York.

THE BUSINESS WOMAN'S JOURNAL contains a sketch and portrait of Mary E. H. G. Dow, ex-president of the Dover, N. H., Horse Railroad. Something over a year ago, Mrs. Dow owned a small amount of stock in the road, which was not a paying investment. Patrons of the road found fault with it also, as the accommodations were very meager and the fares high. In this condition of affairs a Boston syndicate proposed to buy the road at a very low figure. Mrs. Dow concluded that if there was any money in the road, she might as well try her hand at it. She went quietly to work and when the next meeting of directors was held, every one was very much surprised to find that she had acquired more than half the stock, and was therefore master of the situation. Several gentlemen who wished to be on the board of directors refused to vote for a woman for president; they said it was preposterous, and meant bankruptcy. But as she owned the majority of the stock, she held the key to the situation, and by voting for her, they could be directors, otherwise not. They succumbed. Her first move as manager was to double the insurance; then to pay cash for everything, thus getting a large discount on all bills; she raised the wages of employees and reduced the fares. In short, by the application of sound business principles, she managed the road to the satisfaction of the public, paid a portion of the old debt, and declared an 11-per cent. dividend as against five per cent. in former years. Then, to cap the climax, she secured from the legislature an amendment to her charter allowing the use of electricity, thus enabling her to dispose of the road at a large profit. In addition to her business ability, Mrs. Dow is a most estimable wife and mother, a skillful housekeeper and cook, an expert gardener, an amateur veterinary surgeon, is a good shot, a fine swimmer, and possesses all the graces belonging to lovely woman. One such example as hers will do more to secure for woman the concessions she seeks than thousands of loud-mouthed lecturers who prate about what woman would do if she only had the chance. Mrs. Dow had the chance and she improved it. Her first chance was when a young girl, her father being in poor health, the management of the farm fell upon her shoulders. There is much more of interest to women, notably the article in relation to the reappointment of the two women who have done such faithful work as school commissioners in this city, and who have the whole force of the political machine against their reappointment. The price of the magazine has been reduced to 55 cents per year, or 10 cents per single copy. Bi-monthly; Mary F. Seymour, 38 Park Row, New York.

ST. NICHOLAS begins its 17th volume with the November issue, and it has become quite a lusty, vigorous youth. It celebrates its birthday by appearing in a new dress—of larger type—and by adding to its always generous number of pages, so that more than the usual amount of matter is given. Two contributors describe different methods of rabbit-hunting in the West. One, entitled "Coursing with Greyhounds in Southern California," by C. F. Holder, gives the method employed by the white sportsman in that State. The other, "A Pueblo Rabbit Hunt" by C. F. Lummis, gives the primitive method employed by the Pueblo Indians of New Mexico. They kill the game by means of a curved club, a sort of boomerang, which they throw with great skill. "The Poet of the Hempstead Centennial" is a story which will please the boys. A bright boy of 14, shy and sensitive, who had manifestly little business ability, having of necessity to choose some trade, chose that of printer because it was in some way connected with the illustrated papers which had so interested him. During the third year of his apprenticeship, the town in which he lived, decided to hold a bi-centennial celebration and advertised a generous prize for an ode suitable for the occasion. After much hard study, after anxious days, and sleepless nights, the committee at a crowded meeting announced its decision, and to the astonishment of everybody, our hero included, the dazed boy received the prize. Harry A. Doty tells "Why Corn Pops." "Jokers of the Menagerie" is an amusing account of the pranks of some of the animals in the zoological garden at Central Park. A very amusing little comedy in verse is "Sir Rat," with characteristic illustrations. There are several other articles both entertaining and instructive, and all of a high order of merit. It is a good number. The Century Co., New York.

THE CENTURY gives the first installment of the autobiography of Joseph Jefferson. He was almost born in a theater; at all events, his earliest recollections are entirely connected with one. Behind the scenes in a rickety old frame building in Washington was his first play-house. He gives reminiscences of his early and later life and of the many noted men with whom he has been associated. An adventure at the home of Lincoln is related in which he was befriended by the latter, then a young lawyer. Numerous illustrations of noted actors are given. "The Problems of Modern Society" is the first of a series of "Present-day Papers." The author is Dr. Langdon, who with Bishop Potter, Drs. Munger and Dike, Professors Shields and Ely, and Seth Low, have formed themselves into a "Group" for the purpose of discussing certain sociological questions of consequence to the well-being of the community. George Kernan gives a chapter of "Adventures in Eastern Siberia." The Lincoln History treats of "The Second Inaugural," "Five Forks," and "Appomattox." Mark Twain contributes an article "A Connecticut Yankee in King Arthur's Court," which consists of extracts from his forthcoming book having the same title. Judge Ernest H. Crosby makes his appearance as a story writer, in "The Case of John Van Arsdale." Mrs. Carter describes "Street Life in Madrid." "Friend Olivia" by Amelia E. Barr, and "The Merry Chanter" by Frank R. Stockton, are serials begun in this number. "The Grolier Club" is an account of the history, purposes and methods of this new club. There are numerous poems, open letters, short articles, etc. The Century Co., New York.

THAT FAVORITE old fashion periodical, Peterson's Magazine, is being constantly improved to keep abreast with the times. For 1890 it promises a new cover, new type, and eight new serial stories, besides other attractions. Its Thanksgiving number has three short stories and a poem for the season, portions of interesting serials by Alice Maud Ewell and Frank Lee Benedict, a finely illustrated article about butterflies, "Talks by a Trained Nurse," a short talk about bulbs and other matter in the regular literary department. The fashion department gives practical and very stylish designs, with a pattern for a walking-jacket, while the fancy-work department has several holiday designs. A lovely design of peacock's feathers, and a colored design for embroidery deserve special mention. The cut-paper patterns are a very excellent feature, being worth more than the cost of the magazine, in hard cash, to the home dress-maker. The magazine will be furnished to new subscribers till the close of 1890 for $1.75. Regular price $2. Peterson Magazine Co., Philadelphia.

BOOK REVIEWS.

THREE DELIGHTFUL holiday trifles from Lee & Shepard, that lie on our table are a Christmas and a New Year souvenir, and a calendar for 1890. Each is in the form of a booklet of artistic cards, gilt-edged, and printed in delicate colorings and quaint type, tied with ribbon, and arranged with silver rings and chain for suspending wherever they may appear most charming. The price of these pretty gifts is 75 cents each, put up in separate boxes. But the very sweetest and most bewitching of all the dainty devices of the bookmakers, to our mind, is Our Baby's Book. In style of get-up, it is quite similar to the preceding, but the cards are much larger, about 10 by 11 inches, and the type is all illuminated. There is a page for Baby's birth, with an appropriate verse; another for its weight, at different periods from birth till two years old; one for name, lock of hair and first tooth; one for christening, with the names of sponsors; one also for Baby's first picture, etc., so that the twelve pages form a complete and tangible record of Baby's little life, even of "Baby's Own Wise Sayings and Doings!" What adoring mother or family circle could ask for more? Lee & Shepard, Boston.

A NEW NOVEL by Lucia True Ames purports to be the "Memoirs of a Millionaire." In spite of its doleful title and tragical ending, the book is pleasant and very interesting reading. It contains much needed information as to the condition of the children of toil, and is full of new schemes for improving that condition. One of these consists in establishing libraries and reading rooms in the frontier townships that are starving for such privileges, as an aid in shaping the future of young towns and of the children of the pioneers. The book will bear careful reading by the thoughtful and will induce thought in those who are careless. The author takes the ground that the young man who has been born with the heritage of American citizenship, and who does not spend himself in trying to pass its privileges on to those less favored, is more to blame than the anarchist. Five by seven inches; price $1.25; Houghton, Mifflin & Co., New York and Boston.

"A RAMBLER'S LEASE," is a very pleasantly written story by Bradford Torrey, giving an account of a naturalist's rambles in the woods and fields of New England. The author has found so much pleasure in other men's woods and fields that he has come to look upon himself as in some sort the owner of them. His private opinion is that the world belongs to those who enjoy it, and he thinks that some of his more prosperous neighbors would do well, in legal phrase, to perfect their titles. In this book he has tried to be of service to them in this direction. He has succeeded in making that rare combination, an entertaining narrative, joined with much instruction. A great deal of natural history is woven into this tale of the woods and fields, which cannot fail to receive a warm welcome. Cloth, five by seven inches, 222 pages; $1.25. Houghton, Mifflin & Co., Boston.

SUN AND SHADE. This is the unique title of a monthly magazine published by the Photo-Gravure Company 3d Ave. and 10th. Street, Brooklyn, N. Y. The magazine is well named. Each number is a collection of remarkably beautiful photo-engravings printed from the finest photographs that can be obtained. The engraving, the press-work and the mounting are all perfect. This is doubtless the most artistic periodical published in this country. The price is $4.00 per year or 40 cents for each number.

MASON & HAMLIN

The Cabinet Organ was introduced in its present form by Mason & Hamlin in 1861. Other makers followed in the manufacture of these instruments, but the Mason & Hamlin Organs have always maintained their supremacy as the best in the world.

Mason & Hamlin offer, as demonstration of the unequalled excellence of their organs, the fact that at all of the great World's Exhibitions, since and including that of Paris, 1867, in competition with best makers, of all countries, they have invariably taken the highest honors. Illustrated ORGANS $22 to $900 catalogues free.

Mason & Hamlin do not hesitate to make the extraordinary claim for their Pianos, that they are superior to all others. They recognize the high excellence achieved by other leading makers in the art of piano building, but still claim superiority. This they attribute solely to the remarkable improvement introduced by them in the year 1882, and now known as the "MASON & HAMLIN PIANO STRINGER," by the use of which greatest possible purity and refinement of tone, together with greatly increased capacity PIANOS GRAND & UPRIGHT, for standing in tune and other important advantages.

A circular, containing testimonials from three hundred purchasers, musicians, and tuners, sent, together with descriptive catalogue, to any applicant.

Pianos and Organs sold for cash or easy payments; also rented.

BOGUS BUTTER BUYERS

A BRACE OF CLEVER ROGUES.

The following correspondence will practically explain itself:

DEAR RURAL:

I HEREWITH send you two letters which I suspect point to a subject for your "Eye-Opener." Letter No. 1 was handed to me by a neighbor and I answered that I would like to supply the firm with butter, but could not send any till I became satisfied that it was "all right." This brought letter No. 2 written by Webb (?), and I began to think I might get a paying thing; but wishing to be sure of my ground I went and examined Dun's Mercantile Reporter, and not finding the firm name of Webb & Warren in the Philadelphia lists, I began to think that some one was trying to get 300 pounds of my good butter for nothing. Now if you think it in the line of duty or charity to investigate this case I, for one, would be very glad to learn the result of your investigations. J. W. W.

Belmont, N. Y.

NO. I.

We would like to make arrangements with some one in your section to supply us with 300 pounds of sweet, dairy butter per month, put up in six packages for our own use and a few friends. We have been getting our butter from York State for years and the party who supplied us is now living in New York City; and we will have to look for some one else to deal with. The butter must be strictly pure and there must be no coloring in it, and it must be shipped by express. We distribute it, and send you the amount of the bill on the 1st or 15th of each month. Please favor us with an early reply, and if you don't handle butter, pass this to some good party for reply. WEBB & WARREN.

150 Vine Street, Philadelphia.

NO. II.

"Your favor of the 30th of September is duly noted. For the last 11 years Mr. James E. Wood of St. Lawrence County, now living in New York City, has supplied us with butter of his own make and it was done in a perfectly satisfactory manner. After he had moved to the city we had to look up some one else. We have had several replies to eight or 10 letters we put out. Some say they can buy for us; others are inclined to look upon us with some suspicion. Well we will explain to you why we get our butter from the producer. First, we can get it cheaper, and, secondly, we get a more even grade of the article. We can pay this month 30 cents f. o. b., that is about 31 cents here according to the express rate and when we go to market we have to pay 45 and 50 cents for a good article, and you know that it is impossible to buy an even grade of butter in that way; besides, the cost is much more sometimes, reaching 75 cents in the winter time. We don't mean to create an impression that we are stingy, but business is business and a few dollars saved per month are the interest on a few hundreds and while Mr. Warren and myself are getting along in years we still adhere to the maxim: "Take care of the cents and the dollars will look out for themselves." We would like you to send us 300 pounds at once and we will send you a bank draft on the 15th for your bill. We are out of good butter and have been since the 15th of last month. There are six families and we take a 50-pound package each per month. If you can't supply us with all we need this winter, we should think you could manage to buy some of your neighbors. Now a word about ourselves. We don't know what difficulty you folks have in dealing with people, but presume you have your ins and outs the same as every one does. If we were in to fleece you, don't you think we would bait you for a little more than 300 pounds? Well, we have been handling mortgages, stocks and real estate for 30 years and can refer you to any mercantile agency or any house in the city. If you will ship us the butter on receipt of this, we will be likely to deal with you some time. Please either ship at once or let us know, as we have another farmer situated about as you are who seems to want our trade. If you can put the butter down lower than 30 cents we expect you to do so. This is rather a long-winded epistle, but we want you to understand the matter fully. WEBB & WARREN.

The first letter is a poorly printed typewriter circular, evidently printed by an ordinary press. The name and address are in clearer type, evidently put in later. The matter was placed in the hands of a very trustworthy correspondent in Philadelphia who reports as follows:

"We have your inquiry of the 19th, in regard to Webb & Warren, 150 Vine St. We sent a man down to this address and he found it was a cigar store, kept by some one of a different name from that given. He went in and found two men and a woman throwing dice; he asked if they knew of the firm and after a significant look at each other, they said they did not, but they thought the concern had moved away from there about a week ago and had gone to Baltimore. This is all the information he was able to obtain. They are not given in the directory or the mercantile report, and we think it is safe to say that they are a 'snide' concern of some kind."

This is an old trick. It is always safe enough to bear in mind that a city man who is really anxious to obtain good butter will be willing to pay for it C. O. D. or give references that can be readily hunted up.

CATALOGUES, ETC., RECEIVED.

MORTGAGE INDEBTEDNESS ON THE FARMS AND HOMES OF THE COUNTRY.—This is the heading of a circular sent out by the Western Economic Association of St. Louis, Mo. The substance of the circular is that the times demand an investigation into the state of American mortgages. Accurate statistics showing the actual facts regarding such mortgages would be of great value in determining some of the many problems of political economy which are now being forced upon us. Various strong statements are being made regarding the distribution of wealth in this country as well as the tendency of such wealth towards a small proportion of our population. An accurate statement of debts and mortgages would throw new light on these questions. It appears that the required statistics can only be secured through the agency of the National Census Bureau. As matters now stand there must be a special appropriation and special authority from Congress before the Bureau can undertake the work. The object of the circular is to urge farmers to write to Secretary Noble at Washington and also to the Congressmen from their respective districts urging the necessity of such special appropriation and authority. Granges, farmers' clubs and institutes are strongly urged to pass strong resolutions in favor of the project and forward them to their representatives. This is a matter of considerable importance, and we hope our readers will help the cause along.

AMERICAN POMOLOGICAL SOCIETY.—The proceedings of the 22d session of this society are sent by the Secretary, A. A. Crozier, Ames, Iowa. As our readers know, this session was held at Ocala, Florida. The R. N.-Y. gave a full report of the proceedings. The publications of the American Pomological Society are accepted as the highest authority on pomological matters. It is enough to say that this volume fully sustains the high reputation for solid value won by previous ones.

PEACH ROT AND PEACH BLIGHT.—We are informed in an "editorial bulletin" from the Department of Agriculture that Dr. Erwin Smith has treated this subject in the September issue of the Journal of Mycology. The disease is due to a parasitic fungus.

"Dr. Smith finds that this fungus causes a very characteristic blight of the twigs and branches. In rainy seasons this is quite apt to occur, especially if the rotting fruits are allowed to remain upon the tree. He also finds that the fungus lives over-winter in decayed fruits, and in this way is re-produced year after year. In the spring these dry, wrinkled fruits, which have been left upon the earth or still cling to the branches, swell and soften under the influence of repeated rains, and produce a new crop of spores exactly like those of the previous season. The practical importance of this discovery is very great. Could the blighted twigs and rotted fruits of one season be entirely destroyed the fungus would disappear and the rot with it. The more nearly complete this removal of infectious material can be made the safer will be the succeeding crop. During the growing season the fungus produces innumerable spores and spreads its infection very quickly. For this reason, all rotting peaches should be removed from the trees and buried or burned, as soon as discovered. This can be done during the picking season without much additional expense; but it may frequently be necessary to do it before the fruit is ripe, if the grower would save any portion of it in a marketable condition. Finally, not a single rotted fruit should be allowed to winter over. All must be destroyed. If fruit-growers would unite and follow this method systematically for a series of years, the losses from peach rot would be reduced to inconsiderable proportions. These remarks apply also to the rot of plums and cherries, which is caused by the same fungus, known technically as Monilia fructigena."

ADVANCE SHEETS of the Bureau of Statistics for the month of September give a very favorable showing for the exports of agricultural products, as compared with the same month of 1888. The following table shows the total exports in four of the leading branches of trade:

	September.	
	1889.	1888.
Animals.....	$2,850,248.	$1,087,050.
Breadstuffs.....	9,874,788.	12,758,169.
Cotton.....	17,907,778.	8,999,288.
Provisions.....	8,709,549.	6,718,522.
Totals....	39,342,363,	29,563,029.

The figures show that the total exports for 1889 exceed those of 1888 by about one-third. The increase in cattle is about 175 per cent., in provisions nearly 30 per cent., while cotton has about doubled. The heavy increase in the latter is attributed partially at least to the corner in Liverpool. The only item showing a decrease is breadstuffs, which declined more than 20 per cent. The shrinkage was in the amount of wheat, the amount of corn having largely increased. The shrinkage in wheat exports is largely due to the unsettled condition of the markets, and the constant fluctuations in prices caused by the operations of the grain gamblers. The farmers of this country can raise enough to feed the world, if the markets can be arranged to handle the products.

THE MAPES COMPLETE MANURES.

—PREPARED SPECIALLY FOR—

Potatoes, Early Truck, Corn, Orchards and Vineyards (also for Improvement of Quality of Fruit), Grain Crops, Grass Top-Dressing, Small Fruits, Tobacco, Orange and Truck Growing in Florida, Pineapples and other Tropical Fruits, Etc.

These Fertilizers are True Manures, Not Stimulants.

The official State Agricultural Station Reports show the Mapes Manures to be

THE HIGHEST GRADE MADE AND THE CHEAPEST TO THE FARMER.

They Contain the Largest Quantity of Soluble Plant Food as Compared with Cost.

PROF. GEORGE H. COOK, of the New Jersey Experiment Station, reports, in a late bulletin, upon what the R. N.-Y. has so persistently endeavored to impress upon its readers.

As a rule, he says, the fertilizer which contains the greatest amounts of nitrogen, phosphoric acid and potash is the cheapest; for the cost of manufacture, freightage and rate of commission are the same for high-grade as for low-grade fertilizers, and *the labor on the part of the farmer is increased as the grade of the goods decreases.*

The R. N.-Y. confidently anticipates the time when there will be no demand whatever for low-grade fertilizers.—*Rural New-Yorker, Aug. 24th* 1889.

Farms Growing Steadily Richer, and Profits Increasing from the Long-Continued Use of the Mapes Manures.
NO EXHAUSTION IN ANY CASE.

"Jersey Farms That Pay."

THE RURAL NEW-YORKER, June 22d, 1889, states: "And while on this subject the R. N.-Y. is led to refer to a farming community it has just visited. This community is in New Jersey, within 50 miles of New York. The cheap lands of the West will so flood Eastern markets with staple products that New Jersey farmers will have to become gardeners or truckers! Farming cannot be done without the use of stable manure as a basis; chemical fertilizers will "burn up" the soil! At certain seasons of the year we hear these statements repeated over and over again. How ridiculous they appear after a visit to the community we speak of. Here we have a class of farmers growing rich at producing hay, potatoes, corn and wheat. Yes, actually growing rich at producing Western products within 50 miles of New York. And it is done practically *without stable manure; a farm having less than 10 head of cattle sells from* $1,000 to $1,200 *worth of hay and absolutely grows stronger and more productive each year.* Under such a system of agriculture the boys stay at home, farm life is robbed of its worst features and becomes a very ideal life of comfort and happiness. We saw this life realized—saw the crops, the tools, the men. We were so interested in it that we propose to tell R. N.-Y. readers just what we saw. We hope our report will lead to some hard thinking. It will be nothing but a report as honestly written as possible."

The reports on these farms may be found in the RURAL NEW-YORKER, on pages 441 and 442, July 6th, and on pages 459 and 460, July 13th, 1889, under heading "New Jersey Farms that Pay." On these farms (D. C. Lewis and others) the Mapes Manures have been used almost exclusively from ten to fifteen years successively, and the crops *average fully* double those grown in former years under the systems then practiced. Poor lands are now purchased at current low rates with confidence by farmers who know from experience that they can bring up these lands into good, profitable grass-growing condition, and make money from the start.

Some Leading Authorities on the Mapes Manures.

"Our own experiences with various commercial fertilizers have convinced us that with judicious use of the Mapes Manures worn-out lands can be **Restored to Fertility Quicker and with less expense**, than in any other way."—*American Agriculturist.*

"The remarkable success which has attended the Mapes Fertilizers has given them an enviable reputation and standing, not only in the United States and Provinces, but in Great Britain and other European countries."—*American Agriculturist.*

"Mr. Mapes has studied industriously and has worked conscientiously to help the farmers. I believe he has tried as hard to serve the farmers' true interests as any one in this room. He knows how to make good fertilizers adapted to their needs, and he is making as good ones as he knows how to make. *They are* RELIABLE *and* MAY BE DEPENDED UPON. *You may be sure of getting* WHAT YOU BUY—*getting what is guaranteed. I am glad to stand here and authoritatively make these statements.*"—PROF. GEORGE H. COOK, DIRECTOR OF THE NEW JERSEY STATE AGRICULTURAL STATION, at a meeting of the State Board of Agriculture, at Trenton, N. J.

"The Mapes Fertilizers, though higher in price than some others, are scientifically, carefully and honestly made. In the use of them we are always pretty sure of good results. We use them every year and have not been disappointed in their action (May, 1888). They seem to go *right to the spot* and *stay there better* than any other sort we have used. We get *most excellent results* in both corn and potatoes."—(Nov. 1888.)—*Wilmer Atkinson, Farm Journal*

"Under average conditions, and in far the greater number of cases, we do not hesitate to name the Mapes Potato Manure as the **Best** and **Most Profitable** fertilizer for Potatoes."—*American Agriculturist.*

"The Mapes Potato Manure is certainly as good a fertilizer for the crops as we can expect to find."—*J. T. Lovett, Orchard and Garden.*

"Its action **approaches certainty**, or as near it as any manure can be expected to do."—*E. S. Carman, Rural New-Yorker*

Send postal for descriptive pamphlets, (farm crops, trucks, grapes, fruits, etc.) The Mapes Fertilizers, owing to their high concentration are particularly well adapted for long shipment, and make a saving of fully one-half in freight as compared with ordinary Commercial Super-Phosphates.

THE MAPES FORMULA & PERUVIAN GUANO CO., 158 Front St., N. Y

Humorous.

The RURAL NEW-YORKER *is prepared to offer very liberal terms to good, responsible* PERMANENT *agents. Correspondence solicited.*

TED was invited out to tea with his mother one day, and among other dainties a saucer of orange gelatine was set before him. It was a new dish to the little fellow and he eyed it disparagingly a minute, then said, very politely: "If you please, ma'am, thank you. I rather guess you can have it back—it keeps wagging so."—*Cincinnati Gazette.*

NOT many days ago a gentleman had taken affectionate leave of his wife and daughter, for a three months' trip abroad. The child, a lovely little girl of two and a-half years, stood by a chair with her thumb in her mouth—a favorite pastime, and, to her, a panacea for all her childish ills. She watched her mother for a few moments, saw the tears filling the lovely eyes and dropping one by one from her cheeks, then went to her side, and with a comforting tone, looking pityingly up to her face, said "Mamma, suck 'oo fum!"—*Texas Siftings.*

A JOURNAL FOR THE SUBURBAN AND COUNTRY HOME

VOL. XLVIII. NO. 2077. NEW YORK, NOVEMBER 16, 1889. PRICE, FIVE CENTS. $2.00 PER YEAR.

Entered According to Act of Congress in the Year 1889, by the Rural New-Yorker, in the Office of the Librarian of Congress, at Washington, D. C.

Horseman.

FANNY FERN.

HATTIE B. COLBY.

HAVING from a child loved horses, I have been much interested in the portraits of the horses in the R. N.-Y. since it has been received regularly in our home for several years. I have through circumstances taken an interest in the farm, and since the feebleness of age made it necessary for father to give the care of it, in part, to me I have tried to understand the business, and to make it successful and to become a good farmer.

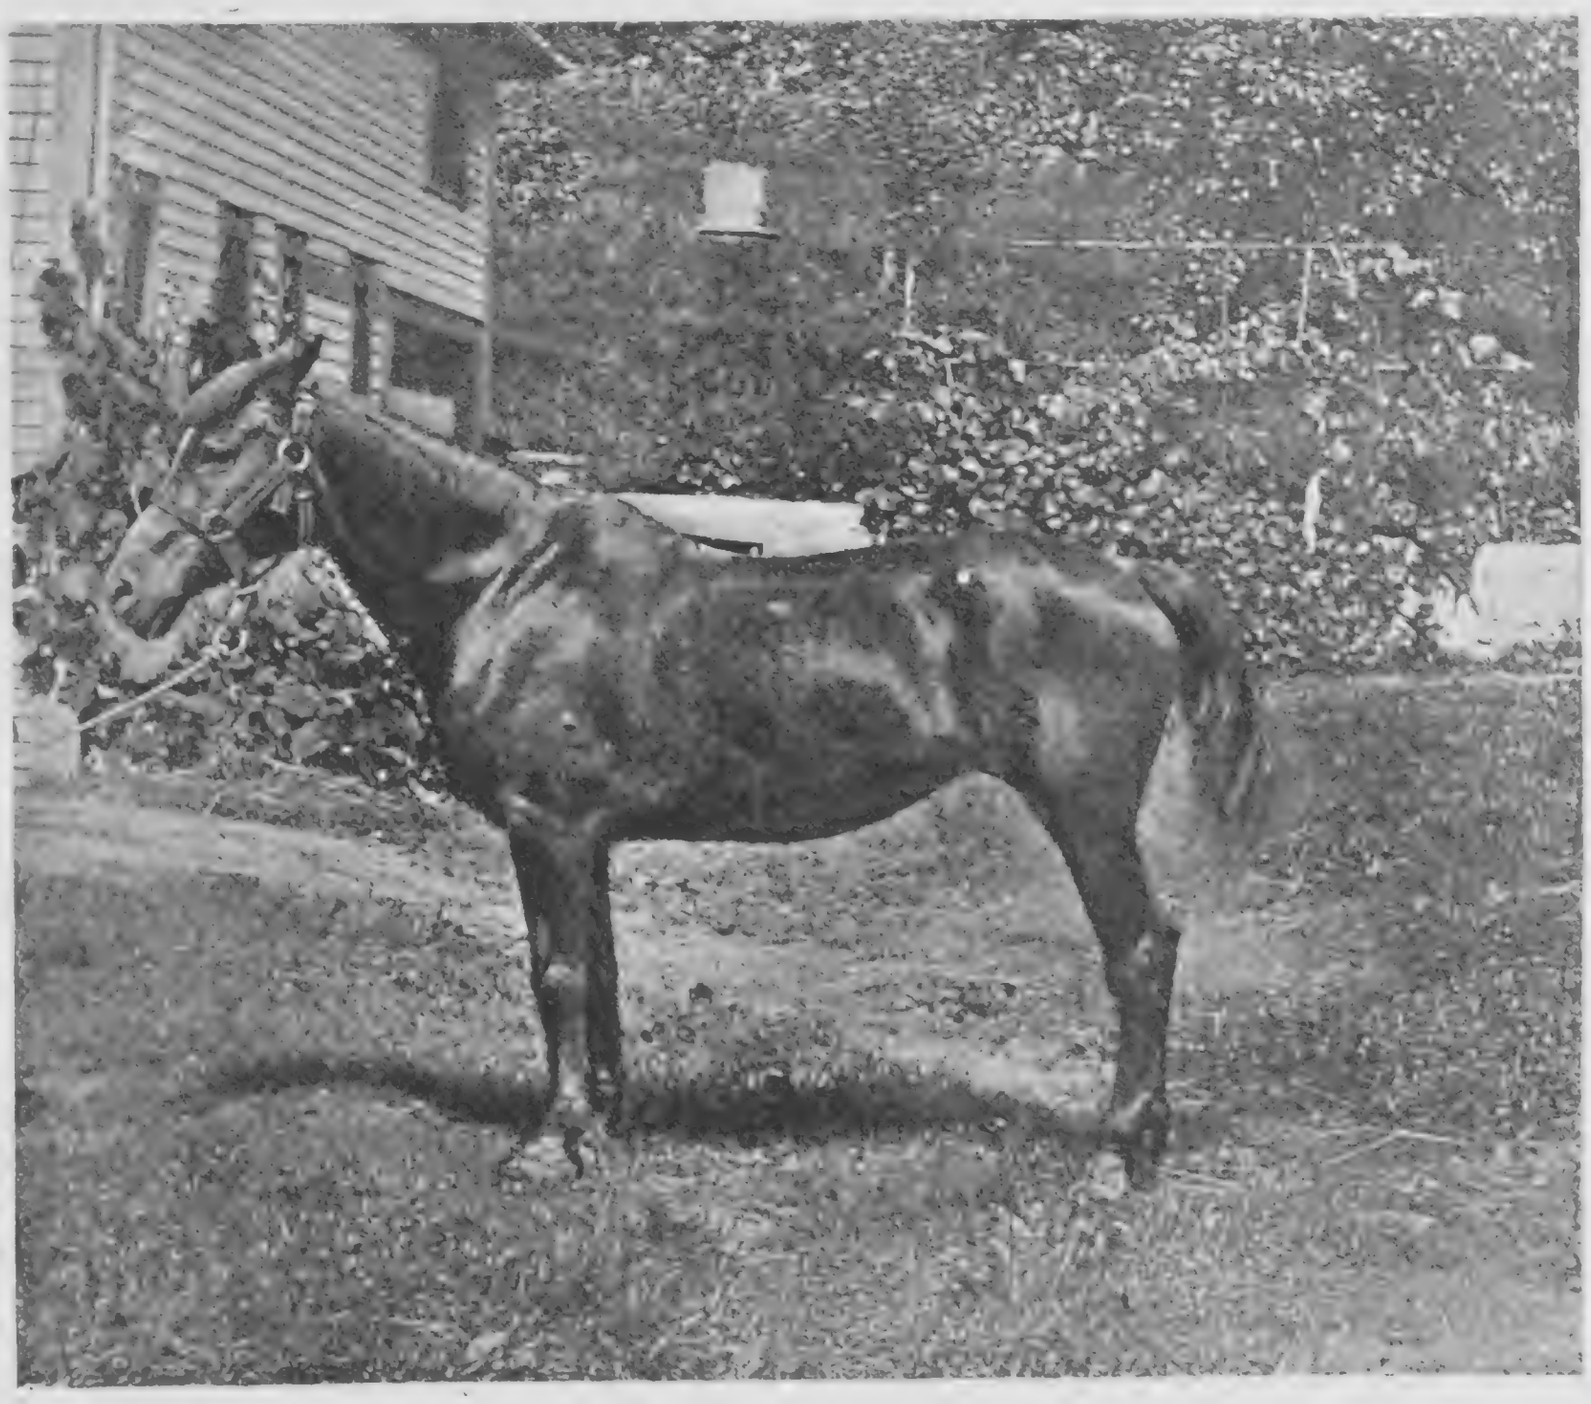
The very handsomest farm animal to my mind, is the horse, and as I see the horses as they pass by at the fairs I quietly observe them, and like to read of them, and it has struck me as a wrong move when, in rocky, hilly New Hampshire the heavy draft horses, and the delicate trotters were introduced. Either class as a true farm animal is entirely out of place here. The type of horses which is fast running out was by far superior for this place. At Fig. 274 a fine specimen of the race—the old Morgan blood—is shown in "Fanny Fern." She was foaled in June, 1854. The picture was taken in July, 1889. She was raised by Johnson Colby in Sutton, N. H. Her sire was Flying Morgan and his sire was the celebrated old horse Justin Morgan. Her dam was Kate of Crown Point, sired by old Engineer. Her dam was Black Bess, a French-Canadian mare. Engineer was a race-horse of considerable note in his day for long distances upon the ice of Lake Champlain. He was owned at Ticonderoga, N. Y., and my uncle said, the white horse was ahead fully his share while Bess trotted nearly as fast as he would run. So the combination of speed and endurance was hers upon her dam's side, while the beauty and goodness of the Morgan family are well known.

Fanny Fern is of a rich chestnut color with a small white star in the face, showing no black, but shades of chestnut, with heavy mane and tail in her young days; then her weight was 1,000 pounds; at present she is somewhat lighter. She raised two colts, one sired by a Morgan horse (name forgotten).

This colt was a chestnut, and a large, powerful horse. Her second colt was by Lightfoot, which was sired by old Vermont Black Hawk. This colt, Kate, we now own and she is a prompt, nice horse at 22 years old, more slender in build than her dam, a trifle over 900 pounds in weight and a dark chestnut with black points. She never showed the dam's speed and endurance, although a good horse. Horses that can take medium loads promptly over hilly roads and around sharp turns, and a buggy 10 miles an hour are far better than those that can make a mile in fast time, or than large horses that cannot be safely trotted over the rough roads; if they do draw heavier loads, they go slower. I wish the Morgan horses were improved and treasured, and the blood kept, instead of the other bloods being introduced. The Wilkses, Almonts, and Lyonses are too frail and slender for farm work, and the grade draft breeds are too heavy amid our rocky fields, and very unsatisfactory upon the road. Fanny Fern is at present at Newport, N. H. She is now very hearty and vigorous, and still able to take her owner on our country roads at a 10-mile-an-hour gait without urging. She will not yet bear the whip. For endurance, for cheerfulness in the harness as a driver, and for kindness to proper handling and ease to keep, she is a grand specimen of the famous Morgan family. She was never tried upon the track. A few of her drives were 25 miles in two hours and 20 minutes from pasture, and without grain, with a common buggy and two persons, and she was not at all tired or lifeless. I could have come right home after it, but rested her for four hours, and then came home nearly as quickly, although up grade.

She has traveled 80 miles in 14 hours, and done her next day's drive as well as usual. In the snow with a good track and three inches of light snow with a sleigh and two persons (over 200 pounds each) she has gone 12 miles in 55 minutes, and in one drive she made five miles in 20 minutes. This will show what a good farm horse can do, and she would do the farm work in the same style. With 500 pounds of grain in the farm wagon she refused to walk but went at her usual gait. She is very knowing and would resent an insult like being struck, just as most men would. We never strike her, but strangers often get struck back again. With abuse she would have been ugly—it was all there. Much of my love for horses is owing to dear old Fan. It was hard to tell which was the happier, when in our girlhood sister Jennie and I would take Fan and fly away over the stretches of hill and valley of my beautiful home land. We often took trips of 12 or 15 miles for our after-tea ride, with the dear mother saying: "Be back before dark, girls;" while some said: "Those Colby girls will get killed yet with that ugly horse." But old Fan always minded the rein if drawn, and a gentle call would stop her. The comparison of a French draft or Norman grade with the Morgans is not very flattering for a true farm horse. The latter is the true every-purpose horse of the New England farms. We must combine strength, endurance, speed and beauty to fill this place, and also look to the expense of the animal's keep. Two good grade Morgans can be readily kept upon the feed for one large, heavy horse according to the experience of several who have tried it.

Merrimack County, N. H.



MORGAN MARE FANNY FERN. From a Photograph. Fig. 274.

The Vineyard.

THE COLORADO GRAPE.

Editors R. N.-Y.:

I HAVE to-day shipped to you by express a sample of my seedling grape "Colorado." I would like your opinion of it. The vine is six years old from the seed. It is about two weeks later than the Brighton in ripening. As to hardiness, I left a part of the vine on the trellis unprotected and I know it will stand zero without protection. Zero weather was the coldest we had last winter. I have a grape arbor 300 feet long by 10 feet high planted to choice grapes. On one side I had a Brighton and on the other a Chasselas. These two vines interlocked their branches on top of the arbor and while they were in bloom the bees were very busy. Both vines set very fine clusters of fruit and I thought it would be a good chance to get a good seedling. I saved these clusters until they were dead-ripe, washed out each variety by itself and sowed them at once separately in boxes in my hot-house and raised about 2,000 seedlings. I saved some 600 which appeared to give most promise. They have almost all fruited this year and this is the only one I think worthy of propagation. This vine last year bore about five pounds of fruit; this year it has borne 40 pounds. I only propagated 11 vines from it last year; this year it has made but very little wood owing to its bearing so heavily.

J. G.

Canon City, Col.

R. N.-Y.—The grapes were received October 21. The bunches are of medium size, rather long, averaging five inches, not shouldered. Berries crowded, larger than Delaware, not quite so large as Catawba; color of Catawba. The quality is sweet, there is not a trace of acidity; pulp perfectly tender and melting, or dissolving, the seeds, which are rather large, separating at once. Skin *thin* yet very firm. Should this variety be found hardy and vigorous it will prove a decided acquisition wherever it will succeed. A portrait would have accompanied this note had the bunches not been injured in transit. Grapes for distant shipment should be firmly and closely packed.

Farm Economy.

MAKING A FERTILIZER

OUT OF

Tankage, Ashes and Hen Manure

SUITABLE FOR POTATOES.

A SUBSCRIBER in Eastern Kansas sends the R. N.-Y. the following note:

"What would be a proper mixture, by weight, of ground cattle tankage—principally bone—elm-wood ashes and chicken droppings for a complete potato fertilizer, to be used on black sand river bottom loam—a soil that will produce 150 bushels of potatoes per acre without fertilizer? How much should be used per acre and how should it be applied (the crop will be irrigated if necessary) to produce the largest yield? The supply of material is abundant."

This note has been referred to the directors of the agricultural experiment stations in the States in which fertilizers are most generally used. The replies follow:

FROM G. H. WHITCHER.

I must say that the problem the solution of which is sought by the R. N.-Y.'s Kansas inquirer, is a very difficult one; for the materials (except ashes) are so highly nitrogenous that it is practically impossible to mix a well proportioned fertilizer for potatoes from them. I do not know the history or character of the correspondent's soil, but I have no doubt it is very well stocked with nitrogen and I feel very sure that a fertilizer with no nitrogen, or with but one or two per cent. at most would be best on it for potatoes.

The following analyses represent the average compositions of hen manure, "tankage" and ashes.

	HEN MANURE Fresh	TANKAGE	ASHES
Water	45.73	*14.61	*12.00
Potash	.18		5.5
Phosphoric acid	.47	10.67	1.85
Nitrogen	.79	7.08	

*Mass. Ex. St. Rt. 1888

The potato crop is one that uses up potash and phosphoric acid in greater proportion then it does nitrogen; the following table compares corn, wheat and potatoes, showing the actual number of pounds of nitrogen, phosphoric acid and potash taken up from the soil, per acre, for the various crops.

	Nitrogen.	Phosphoric acid.	Potash.	Ratio of Nitrogen to Potash and Phosphoric acid.	Ratio of Phosphoric acid to Potash.
	Per Acre.				
Corn.					
Sound ears 97 bu } Soft ears 15.... } Fodder 5,352 lbs. }	76.74 lbs.	35.6 lbs.	82.6 lbs.	1: 1.5	1. 2.3
Wheat.					
Grain 15 bushels } Straw one ton. }	25.6	12.2	14 9	1: 1.	1: 1 2
Potatoes 200 bu.	38.4	21.6	67 2	1: 2.3	1: 3 1

This table shows that the ratio of nitrogen to the two minerals in potatoes is small, and it also shows that the ratio of potash to phosphoric acid is larger; that is, while wheat uses nearly as much nitrogen as it does of both phosphoric acid and potash, potatoes use 2.3 times as many pounds of the latter as they do of the former; and not only is this the case, but in the ash of wheat there is only a little more potash than phosphoric acid (1.2: 1); while the ash of the potato shows over three times as much potash as of phosphoric acid; or, to put the table in another form: for every pound of phosphoric acid used by wheat, 1.2 pound of potash and 2.1 pounds of nitrogen are required; while potatoes under like conditions use up 1.7 pound of phosphoric acid, .9 pound of nitrogen and 5.3 pounds of potash. This tabulates as follows:

	Phosphoric acid.	Potash.	Nitrogen.
Wheat requires food in the following ratio.....	1	1.2	2.1
Potatoes.....	1.7	5.3	.9

I have entered somewhat into these details because I wish to make it clear that potatoes do not require nitrogen to anywhere near the same extent that wheat does; but their demand for potash is far greater. The results of experiments in New Hampshire have led me to fix upon two combinations of crude fertilizing chemicals for potatoes. One of these has *no nitrogen* and is designed to be used when potatoes follow some crop which has been manured with nitrogenous animal manures; the other has a small amount of nitrogen and would meet most cases.

Combination IX. (New Hampshire Experiment Station bulletin 6. p. 31) is as follows:

			ANALYSIS OF MIXTURE.
Dissolved Bone-black..	340 lbs.	Phos. acid	11 per cent.
Muriate of Potash....	160 "	Potash	16 "
Enough for one acre..	500 "	Nitrogen	——

Combination X (same bulletin).

			ANALYSIS OF MIXTURE.
Dissolved Bone black..	300 lbs.	Phos.acid	9 6 per cent
Muriate of Potash....	150 "	Potash	15.0 "
Sulphate of Ammonia.	50 "	Nitrogen	2.0 "
Enough for one acre..	500 "		

These I believe to be well proportioned potato fertilizers.

Now to return to the problem at hand, how can the hen manure, tankage and ashes be mixed? First of all, let me say that the ashes must not be mixed with the other materials; for whatever soluble or reverted phosphoric acid there may be in the tankage or manure will be rendered *insoluble* by the action of ashes, if the mixture ferments, and there will also be a loss of nitrogen in the form of ammonia; hence unless the mixture is *used immediately*, one should never mix ashes with organic matter containing phosphoric acid or nitrogen. A mixture of tankage and fresh hen manure in equal parts would contain somewhere near 5.6 per cent of phosphoric acid, four per cent. of nitrogen and less than one-tenth per cent. of potash. The potash evidently must come from the ashes, and to get 67 pounds will require 1,200 pounds, or about 25 bushels. In this amount, there will be 22 pounds of phosphoric acid, which is exactly the amount needed by the crop, so that the ashes alone would prove a very well proportioned fertilizer; but suppose we take 500 pounds of mixed tankage and hen manure in equal parts, and 1,000 pounds of ashes for an acre: this would supply the following:

	Lbs.	Nit'g'n.	Phos. acid.	P'tash.
Hen Manure and Tankage mixed,	500	20	28	1½
Ashes,	1000		18	55
Total supplied,		20	46	55½
Required by crop,		38	21	67

Now the difficulty is at once seen: we get too much phosphoric acid. But perhaps this mixture will come as near as we can get with the materials mentioned. If the R. N.-Y.'s correspondent could buy muriate of potash at a reasonable price, the problem could be solved as follows: 500 pounds of the mixed hen manure and tankage; and 500 pounds of ashes, while 100 pounds of muriate of potash would give 20 pounds of nitrogen, 37 of phosphoric acid and 78 of potash.

N. H. Experiment Station.

FROM DR. PETER COLLIER.

I would say that I don't know, but I would make experiments were the case my own. I certainly would not, however, mix elm-wood or any other ashes with chicken droppings for fear there would be a loss of nitrogen through the chemical action of the fixed alkalies upon the hen manure.

Geneva, N. Y.

FROM W. W. COOKE.

On the supposition that the ashes are unleached and the chicken droppings partially dried, as they would naturally be when swept up from the chicken-house floor, a mixture of 350 pounds of tankage, 300 pounds of ashes, and 200 pounds of hen manure would give a fertilizer equal to 600 pounds of a first-class ammoniated superphosphate with an abundance of potash and be a full amount for an acre.

Vermont Experiment Station.

FROM C. S. PHELPS.

The fertilizing materials at the disposal of this Kansas correspondent are so variable in composition that it is impossible to recommend a mixture having a definite percentage of the three essential ingredients—nitrogen, phosphoric acid and potash. Elm ashes are rich in potash. If well dried and quite free from earth or sand, they will contain not far from 10 per cent. Taking the ashes on this basis, and the general average of tankage and hen manure, the following mixture would be a good one for use on rich bottom lands: Tankage (largely bone) 800 pounds; chicken droppings, 400 pounds; ashes (elm wood), 800 pounds.

This mixture will contain:

Nitrogen.....	2½–3½ per cent.
Phosphoric acid.....	4 –4½ " "
Potash.....	4 –4½ " "

The mixture may be applied at the rate of 1,500 pounds per acre, 1,000 pounds to be harrowed in and the rest applied in the hill or drill. In using a mixture of this kind one precaution is essential. Ashes contain much caustic lime, or calcium oxide, and should never be mixed with compounds containing ammonia—as tankage, blood, hen manure, or sulphate of ammonia—and allowed to remain in a pile for several weeks, or even days, before using. If this be done, organic nitrogen will be rapidly changed to, and given off as, carbonate of ammonia, and of course, lost to the plant.

When mixtures of this kind are desired, they should be prepared not longer than one day before wanted for use.

Storrs School Connecticut Agricultural Experiment Station, Mansfield.

FROM DR. E. H. JENKINS.

It is impossible to give an answer. Tankage consisting chiefly of bones, contains in every 100 pounds, about four pounds of nitrogen and 20 pounds of phosphoric acid. Ashes contain from five to nine pounds of potash and two pounds of phosphoric acid in every 100 pounds, while "hen manure" refers to anything and everything scraped from the hen roost and may be a strong or a very weak manure. But what does the correspondent's soil lack? It may be only water or it may be drainage; if so, any manure may be wasted or worse than wasted on it. It may be that it has an abundance of nitrogen and phosphoric acid in it already; if so, the tankage will be of little use. The only rational plan for him to follow is to test his own land, using the materials named singly on separate rows and in various combinations, supplementing them perhaps with certain chemicals. The details of this plan have been so fully described that I need not go into the matter—see for instance, Bulletin No. 1 of the Storrs Station. If he does this, in a year from now he will have some indications of what his soil needs and what it does not need, that will be a great help to him and his neighbors.

Connecticut Experiment Station, New Haven.

FROM DR. C. A. GOESSMAN.

Ground cattle tankage and hen manure vary so widely in composition that it is hardly possible to decide how much of each should be taken. Wood ashes ought not to be mixed with hen manure; such a mixture would set the ammonia free; for this reason the wood ashes are best applied separately—before or after the hen manure. Taking into consideration an average composition of the various articles mentioned, I should recommend the following proportions per acre: 350 pounds of ground tankage; 350 pounds of hen manure and 600 pounds of good, unleached wood ashes.

Massachusetts Experiment Station.

FROM E. B. VOORHEES.

Soils of the character mentioned usually respond favorably to additions of mineral or ash elements, viz: potash, phosphoric acid, lime, etc. The quality of this particular soil also indicates that reasonably large dressings would be required for the greatest profit.

Where wood-ashes are cheap they should furnish the chief amount of fertilizing material. A mixture of the following proportions applied at the rate of 3,000 pounds per acre, would seem to be advisable: unleached ashes 2,000 pounds; tankage 400 pounds, and hen manure 600 pounds. This quantity of material would furnish, approximately, 125 pounds of potash, 80 pounds of phosphoric acid, 30 pounds of nitrogen and 600 pounds of lime—an applicatian of plant food equivalent to about 1,200 pounds of a high-grade potato manure per acre; an amount which is within the profitable limit in average seasons. The application should be made as follows: 1,500 pounds of the ashes should be broadcasted after plowing and well harrowed into the surface soil. The remainder of the ashes and the other materials should be thoroughly mixed and evenly distributed over the row previous to planting; the covering of the potatoes would insure a complete incorporation of the fertilizing material into the soil near the roots of the plant. The ashes which contain considerable quantities of lime, would probably act quickly upon the nitrogenous materials in the mixture, which should therefore be used soon after mixing to prevent possible loss of ammonia.

New Jersey Experiment Station.

IMPLEMENTS YET NEEDED IN POTATO GROWING.

THE progress we are making in methods of culture calls for constant additions to our already large stock of implements. Just now the progressive potato-grower has reason to complain about the lack of various tools to facilitate some operations in our modern method of growing potatoes. We need, for instance, a single device for pulverizing the soil in the bottom of the trenches. Possibly such an implement might be combined with shovel-plow and seed-coverer. The sketches shown at Fig.

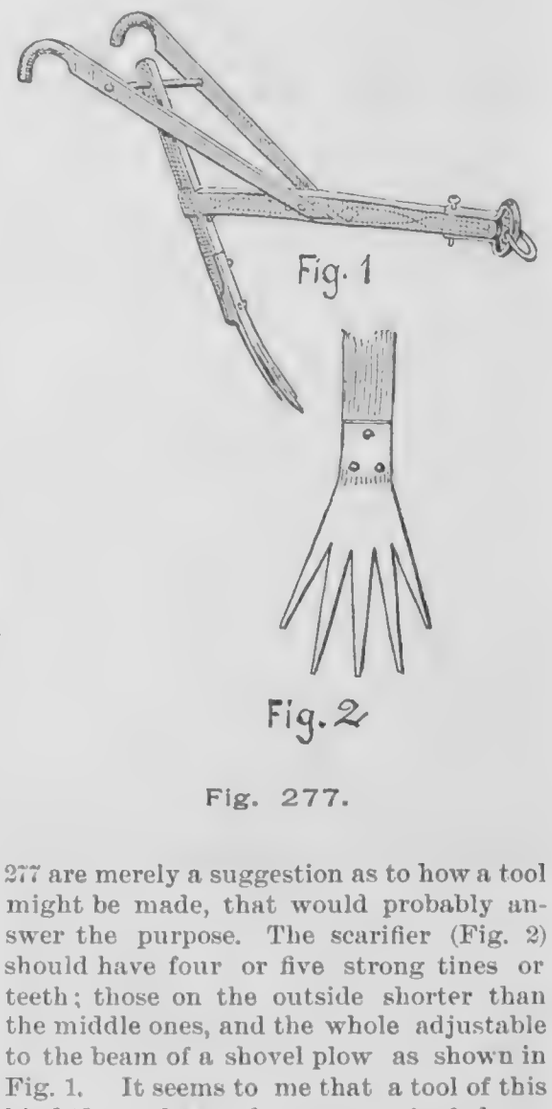


Fig. 277.

277 are merely a suggestion as to how a tool might be made, that would probably answer the purpose. The scarifier (Fig. 2) should have four or five strong tines or teeth; those on the outside shorter than the middle ones, and the whole adjustable to the beam of a shovel plow as shown in Fig. 1. It seems to me that a tool of this kind (drawn by two horses, as a single horse would have to walk in a furrow) could be used to mellow up the soil in the bottom of a trench to a considerable depth, and if some fertilizer be applied below the seed, the tool would mix this up quite thoroughly with the soil at the same time.

Another implement needed is a simple device for scattering the fertilizer evenly, and at any desired rate over the lightly covered seed-pieces in the trenches, and a third implement to the construction of which our manufacturers should give speedy attention, is a more convenient contrivance than any yet offered for the application of poisons on the vines. Devices of this kind are now made, but they are intended for wholesale operations, while we, poor people, (and I belong to the majority) who grow the crop only to the extent of a few acres at most, suffer for the want of a cheap and effective spraying apparatus to be carried on the back (knap-sack-fashion, like the higher-priced Vermorel or Weaver pump) and arranged for spraying Paris-green solutions for the potato bug, tobacco-tea for the flea beetle or kerosene emulsions for other insect foes. These suggestions are offered for the consideration of manufacturers of agricultural implements. I see no reason why they could not accommodate us, and at the same time be doing something for their own benefit. T. G.

Niagara Co., N. Y.

Pomological.

THE LINCOLN—A NEW SEEDLING PEAR.

THE parent of the seedling pear of which I sent specimens to the R. N.-Y. a few days ago, is 54 years old from the seed, and is as vigorous as any tree at any age; it has always been free from blight or any other disease to my knowledge. It is one of the heaviest bearers known to me. It is a fine grower, making one of the most beautiful fruit trees seen anywhere. As it is a seedling it reproduces itself from the roots, and any person acquainted with the tree can always distinguish its offspring by their uniformity of growth and hardiness, and the

sameness of color of the fruits, etc. I have about 80 of the trees growing at present.

Lincoln, Ill. W. E. JONES.

R. N.-Y. The flesh resembles that of the Angouleme. The quality is, so to say, a combination of Bartlett, Angouleme and Anjou. Very juicy, aromatic. The *skin* is like that of the Angouleme; seeds few and small. Received September 14. The pear is represented at Figure 275, with a half-section at Fgure 276. Mr. Jones writes us that he has but recently decided to name it the Lincoln, and as such we now present it for the first time.

Farm Topics.

SOME MORE CROP ROTATIONS.

CONTINUATION OF REPORTS.

FROM M. B. PRINCE.

The usual rotation here with cotton farmers is, first year cotton; second, cotton; third, corn, with slight variations to wheat or oats, for 20 years; then for 20 years more or less to "old field" pine. New land in these later years is planted with tobacco for two years, then it is put under wheat to be followed by corn. On our lands clover makes but a feeble growth without manure, consequently a regular rotation is almost impracticable when we consider the fact that of necessity we must plant more acres of corn than of all other crops combined. A crop of cow-peas plowed under every third year assists wonderfully in sustaining the fertility of the soil; but this is not practiced to much extent. Growing no tobacco and but a few acres of cotton, I follow to a limited extent a three-year rotation, which has proved satisfactory: first, melons with manure in the hills and fertilizer broadcast; second, corn; third, cotton with fertilizer in drill. I use my stable manure on the melons, sweet potatoes, turnips and in the garden. When there is any left it goes on the clover patch. "Why?" Because these are my best paying crops and without the manure, the returns would be very meager. A top-dressing is of but little use here, as the frequent heavy "washing" rains carry off too large a percentage.

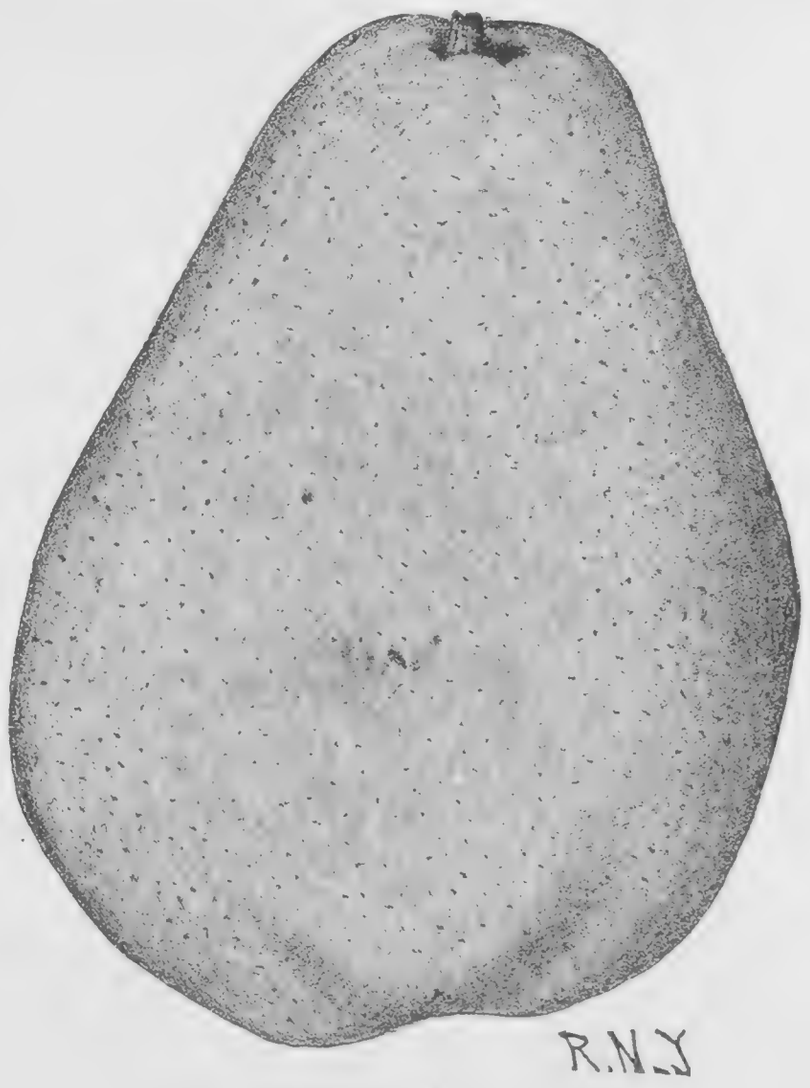
Vance County, N. C.

FROM JAMES DAVIS.

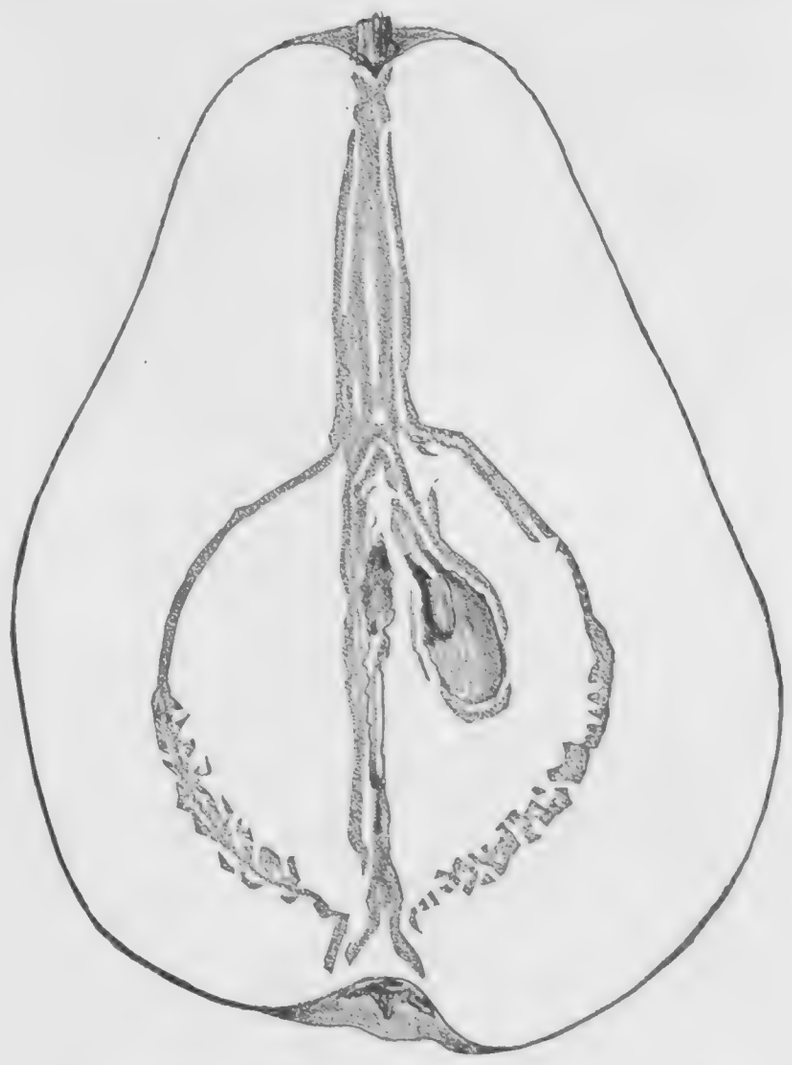
My rotation has been two crops of corn, followed by oats or wheat, seeded down with clover and Timothy, mowed or pastured two years. Till last year I used no commercial fertilizer, and the manure was put on the poorest parts of the field, both for corn and wheat. This fall I bought a ton of fertilizer, Currie's Guano, for the wheat ground. Having to move the manure from the barn-yard, I set my boy, 13 years old, to making a manure heap with the cart while I was helping the neighbors to thrash. First the chip dirt from the wood-house was put in the bottom about a foot deep, then the manure from the barn-yard, then the sheep manure, and then the stable manure. At the last working of my sod-ground corn, July 22, I sowed about half of the field with rye, which is now (October 25,) a mass of green. As soon as the ground freezes, I intend covering it with the composted manure, and what I make through the winter will be hauled and spread as convenient. I hope to have enough to cover the whole field. I shall pasture the rye awhile in the spring, and then plow for corn. I expect hereafter to use all my stable manure for corn.

One of my neighbors, who has been very successful, uses the following rotation: One crop of corn, followed by wheat; seeded down with Timothy and clover, mowed or pastured two seasons. I hope by using the fertilizer on wheat, with the aid of clover, to keep up two crops of corn rotation. The grub-worms have been so destructive on sod-ground corn this season, that I would have to buy corn if mine was all on sod land. Some fields are hardly worth husking. With regard to the effect of stable manure on potatoes, when the manure has been applied in the spring the potatoes have been scabby. Last year I tried sulphur in the hill when planting the potatoes, but so far as I could see it had no effect; all were scabby alike. When the manure has been put on in the fall there was no trouble from scab. Our potatoes in this neighborhood have given a full yield and are of fine quality, with no rot of any account. Early Ohio for early, and Rural Blush for late, give us the largest yields, though White Elephant still does well. For the last three or four years, I have been raking the leaves from part of the wood lot and putting them in the compost heap and sowing with Orchard Grass and Timothy. This season the wood-lot yielded nearly as much pasture as the pasture field. I hope this fall to clear up the remainder of the wood lot, and seed down as heretofore for pasture. We have had fine rains and the pasture is still excellent. I think I never saw wheat look better, though much of it has been sown late; about the usual number of acres have been sown in this neighborhood. I have six acres sown with Diehl-Mediterranean, which looks fine.

Fosters, Ohio.



THE LINCOLN PEAR. FIG. 275.



THE LINCOLN PEAR. HALF SECTION. FIG. 276.

FROM F. R. WENTZELL.

I am employing the same crop rotation that my father followed 50 years ago, and so is nearly every other farmer in this county. It is the old five-year plan. We have our farm divided into five fields—one in corn, one in truck, to be sown to wheat in the fall; one in wheat, two in grass; one to mow and the other to pasture. The next season we pasture the one we mow this. In discussing the matter of crop rotation the R. N.-Y. has touched on a matter of vital importance. We followed this mode of farming years ago, and with some economy could make a comfortable living for our families. But the time has come when we cannot do it; and the great question is what can we do. Scattered over this country are hundreds of farmers who are living on farms of from 50 to 100 acres who are getting worse off every year. Some of them have bought the farms and are paying heavy interest, while others are paying large rents. Last spring they could not pay the rents, so a good many of them gave their landlords chattel mortgages on their stock, hoping to do better this year, but they are worse off this year than last. It is very plain to my mind that we must change our mode of farming. This keeping in the old ruts made by our forefathers must at once be done away with. Last spring I used my stable manure on early potatoes. I carted it out and put it in a compost, then spread all the hen manure I had on the top and worked the heap over several times so as to mix them thoroughly together. At planting time I marked out my rows, spread the mixed manure in the rows, dropped the potatoes and covered them with the plow. Never before had I obtained such nice early potatoes; they were large, smooth, and free from scab.

Salem County, N. J.

FROM E. H. COLLINS.

My usual crop rotation is clover, corn or potatoes or oats and wheat. Formerly I sowed clover in small grain in the spring, and broke for the other crop the next spring, not losing a crop year for grain. But my soil lost fertility and became hard and I was compelled to let the clover have the ground a year and mow it. The soil is now improving. We must also thank clover for clean culture. Year after year weeds came after potatoes were "laid by" and I would vow that the next crop should be clean, but to no effect until I planted on a clover sod. Clover and sheep make clean culture easy. Many methods of handling stable manure are given by good farmers; but somehow they require so much handling that one soon feels like cutting across a corner somewhere, especially in the busy season. He also wants some time for reading and attending the farmers' club, etc., and I find that if I keep the stock well bedded and the bed level, I can take a day when the weather is suitable and clean out and haul to the field and spread the manure at once and it is done for. If I have well rotted manure I like to spread it on plowed ground ready for any crop. If not very rotten, it may be spread on my level sandy soil in the fall and plowed under in the spring and it will do well for either corn or potatoes. I had five acres of potatoes this year on the above plan and they were smooth and a good crop.

The white-grubs damaged the Rose varieties badly about here; they did less harm on the manured plots. The vines on these plots also recovered better from damage done the roots by the grub. The variety was Late Rose and the yield about 180 bushels per acre. A part of the field was trenched and yielded somewhat better. The White Star and Burbank were not troubled so badly by the grub. Rank stable manure turned under just at planting time does not increase the yield of potatoes and may dry out the hill and ruin the crop. Chemical analyses of water from tile ditches draining manured and unmanured plots show that there is practically no waste except of nitrates. The phosphates and potash salts are held by a weak chemical union with the soil. The nitrates may be held in the soil by keeping the ground covered with a green crop of some kind. Now with my sandy loam I fear to plow under fresh manure because much of it is placed so far below the roots of young plants that I fear a leaching of the nitric acid into the subsoil before the plants reach it. But if spread upon sod a few months before breaking, these elements will be washed into the soil and utilized by the green plants. At our Carmel Farmers' Club this question received much attention and a second reason was given for surface manuring. It was argued that the dried roots of a very young plant greatly outweigh the dried tops and that this ratio changes as the plant matures till it is reversed in a full-grown plant. Following this hint of nature, I like to mix well rotted manure with the surface soil on plowed land and harrow it in and allow the rain to carry it through all parts of the seed-bed and thus give the young plant a booming start.

Mattsville, Ind.

FROM A. L. CROSBY.

I plow sod for corn and potatoes, next year sow oats, to be followed in the fall by wheat seeded with Timothy then and with clover in the spring. This has been my rotation; but I intend to change it by sowing cow-peas in place of the oats. My reasons for making this change are: the oat crop prevents the early plowing of the ground for wheat; the oats are ready to harvest just as the late summer rains come and they get more or less damaged; if the ground is rich the oats lodge, and if it is poor they don't pay, and even with a good yield the oat crop is not a very profitable one; then the time taken in putting in the oat crop is usually just so much taken from the preparation of the corn and potato ground. On the other hand, the cow-peas can be sown at any time from after frost until midsummer; they make a first-class crop to be plowed under for wheat; they make the very best pasture for cows and pigs; they keep down the weeds; they leave the land in good condition for any other crop—clover perhaps excepted—and I believe for these reasons they will make a more profitable crop than oats.

I use stable manure on any crop except oats, but I think I get about all there is in it when I use it to top-dress Timothy. At what time? Any time after the hay is off, the sooner the better, no matter about the hot sun or the drenching rain, if manure is spread on almost any kind of soil and at any time it is safe—and saved. Manure spread on sod in the fall and plowed under

in the spring, will by that time have been dissolved—the soluble part—and will be, after the sod is turned, within easy and quick reach of the roots of spring crops. I have had no success with any kind of artificial fertilizer for potatoes; Mapes's special potato manure, 1,000 pounds per acre, S. C. phosphate thick enough to cover the ground, hard-wood unleached ashes spread with a shovel so freely that I was afraid it would burn the plants when they came up, were all used without profit or even enough benefit more than barely to show where they had been sown, but stable manure tells a good story every time, and I do not know that there is any limit to the quantity that may be profitably applied. I grow the Rural Blush Potato almost exclusively and have no trouble with rot or scab. The only trouble is to get on enough manure and then keep the ground clean; if I do that then I expect a paying crop of nice, smooth potatoes.

Catonsville, Md.

FROM J. C. STRIBLING.

I apply stable manure to small grains and winter vetches in the fall, and haul some out again in the spring on early corn and cotton lands. After growing good hoed crops, stable manure shows good effects on small grains that follow. Notwithstanding this fact, however, I apply all the stable manure that can be had in the fall on rye, barley, oats and vetches (wheat generally follows cotton that has been heavily manured). This plan pays well in winter grazing, besides so hastening the harvest that I can grow a late crop of corn and cow-peas in addition to the small-grain crop. My winter vetches and barley where stable manure was applied, are now nearly a foot tall, and will afford good grazing at times, and give golden-colored, good, mellow butter all winter. Potatoes grown on land where an old stable stood, smelt like a stable when the cook brought them to the table, and could not be eaten. My observation is that stable manure makes potatoes rough and ill-shaped, while commercial fertilizers produce smooth-skinned, shapely potatoes.

Pendleton, S. C.

FROM J. T. W. LUCKEY.

The general rotation here, as well as my own, has been corn first, oats second, wheat (seeded in the fall to Timothy and in the spring to clover) third; then, of course, grass follows as fourth. Of course there are exceptions to all rules and sometimes this is the case here, especially in the grass crop, as sometimes it is fourth or fifth, which will materially change the rotation of the others. This county is comparatively new and the land being a rich black loam, seems to retain its fertility to perfection. To illustrate, a farm near-by is owned by a capitalist and there is a field of about 40 acres cleared, on which corn has been raised for 10 years in succession and the crop this year will average as good as the first; hence we use nearly all of our manure on our wheat as a top-dressing on the high places, more as a protection than as a fertilizer. This fall the first artificial fertilizer was brought to our county and I sowed it in the drills with the wheat. I use stable manure on potatoes with good results; but the ground is thoroughly drained by tiles. However, we pay little attention to potatoes, corn and hay with hogs, cattle and horses being our main objects.

Decatur, Ind.

FROM L. HULBERT.

We apply our manure on clover-sod if we can get it, plow it under, and plant the ground to corn or potatoes, followed by barley or oats, then winter wheat and seeded. There has been no change lately. Summer-fallowing was practiced considerably at one time, but is not now. We use stable manure on corn and potatoes, also as a top-dressing on winter wheat. We seem to get the best results from the application of the manure in this way. The corn or potato crop leaves enough of the fertility to afford a good crop of barley, and the ground is left in good condition for winter wheat. When applied to wheat in the fall, its invigorating influence enables the plant to withstand the winter, which, in this section, is quite an essential thing. Then as grass seed is usually sown on winter wheat the beneficial influence on the young seeding is very apparent.

In regard to the effects of barn-yard manure on potatoes, I will relate some of my experience. In the spring of 1888 I planted potatoes in a field that had been pastured two years previously. The grass had not been eaten closely, leaving a considerable growth to be turned under. On a portion of the field barn-yard manure was applied in moderate quantity; on the remainder no fertilizer of any kind was used. The variety planted was White Star. The result was so favorable for the manure that a person unacquainted with the facts, and seeing the potatoes growing, judging from the appearance of the tops, would say that there were two distinct varieties, the tops on the manured portion having a much more vigorous growth. The tubers corresponded with the tops. There were from one-third to one-half more potatoes, with no more scab, on the manured part. The soil is a clay loam. This year I planted a field under very similar conditions and I have never had potatoes more free from scab than they are now. They yielded 150 bushels to the acre when many crops of potatoes in this vicinity did not yield 50. The blight did not strike them until late.

Dansville, N. Y.

Dairy Husbandry.

THE OWEGO, N. Y. CREAMERY.

Land and products in Tioga County, N. Y.; buckwheat galore; a great and growing dairy interest; the Standard Butter Company, the largest combined creamery and cheese factory in the State; the building and its equipment; its capacity; nature of the business; vast extent of its shipments; cream-gathering; employees; mode of handling cheese and butter; causes of its great success.

MUCH of the land in Tioga County, like that of Delaware, "is turned up edgewise." Wherever you see a valley you will discover a stream along the banks of which wind and twist one or more railroads. In August, when the dairy conferences were held at Spencer, Nichols and Owego, the haying and oat harvests were at the zenith; the potato vines rusted and blackened; the barley—what little there was—was in stacks, and an occasional field of tobacco on the Susquehanna River flats, or "bottoms," as they are called down there, was being gathered. But in every direction could be seen fields of buckwheat in blossom, looking like so many fields of snow, framed in green. Along the valleys, on the steep hillsides and on the summits of the mountains were buckwheat fields stretching away as far as the eye could discern—buckwheat, buckwheat, buckwheat! It is received in exchange for everything but railroad fare down there, and is the standard of values in the county. There ought to be enough of the product thrashed in Tioga County this season to carpet the State with "slapjacks." I hope there will be.

So much of the land being set up on edge, it affords good grazing territory, especially for sheep and small cattle, and should be better utilized for that purpose; and, as the growing dairy interest there is mostly in the line of butter, there ought to be more Jersey cows and less of the long-horned aborigines. Those little Jerseys will climb the steep hills almost as easily as will sheep; the large natives, Short-horns and Holsteins will not. Then, there are pure, sparkling mountain brooks leaping down the hills and affording a plentiful supply of the purest and best water. Before long there will be more Jerseys and Guernseys, more creameries, more *good* dairymen; less scrub cows and scrub dairymen, less native grass pastures, less "live-forever" growing in the fields, less buckwheat. The dairy conferences and the farm institutes that have been and are to be held this winter, will give the ball, already started, such an impetus that it can't be stopped from rolling.

Nearly all the cows in that county are natives, and, as a rule, the farmers feed no grain ration, except during a few days in spring when the cows are coming fresh; consequently the ratio of butter to milk is not usually a good one. There are some exceptions, however, to the rule: among them are those at some of the creameries, notably those at Owego and Spencer. The former is larger and better-appointed than any other of the kind in the State, and perhaps the dairy readers of the R. N.-Y. will be interested in knowing something about it. It is not properly—or rather wholly—a creamery, but a cheese factory and creamery combined, and it is known as the

"STANDARD BUTTER COMPANY."

It is located at 174 Front Street, close to the business part of the village, and is owned and operated by George Truman, Son & Company. The plant is entirely new, having been erected last year, so that this season is its first in its enlarged capacity. It has already established both a national and foreign reputation, having shipped invoices of butter to nearly every Northern and Southern market and exported some large shipments. Its product is among the very best: else it would not have been awarded the first prize for creamery butter at the late great International Fair at Buffalo, over all competitors.

The building was planned and furnished, after mature deliberation, and is found to be in every respect what was desired. Its dimensions are 100x40 feet, and it is 27 feet high; the lower or creamery room being 17 feet high, and the upper room 10 feet. Its cost, including equipment and vat, was $15,000. All the partitions are double-papered and the floors, which are of the best pine 1⅝ inch thick, are padded. Adjoining the creamery floor is the neatly appointed office. At the east end are the ice-house, engine-room, "pool-room" and refrigerators. In the creamery room are located the dairy implements as follows:

1 Curtis oil-test churn.
1 De Laval Turbine Separator.
1 Cheery quart-test churn.
8 cream vats.
2 Davis & Remington center-drip butter workers.
2 300-gallon churns.
1 250- " "
1 80- " "
1 600-gallon cheese vat.
1 curd sink and one combination-gang cheese-press,

The motive power is a 15-horse-power engine, supplied by a 20-horse-power boiler, and there are also a five-horse-power boiler for heating purposes, a Blake donkey pump, an elevator, etc., etc. At this writing, Mr. Thompson, the business manager, informs me that only 1,000 pounds of butter are made daily. During the "flush"—June season 3,000 pounds were made, some of which was put into cold storage. August 20, there were 1,000 oak firkins holding from 100 to 110 pounds each, in the great refrigerators, designed mostly for export. At present the product goes to 20 different parties, and orders for more than can be supplied are daily received. At present most of the butter is put up in eight and 16-ounce prints, and two, three, and five-pound boxes, for which the highest market price is received. The churning capacity of the building is 5,000 pounds daily; but there is not sufficient vat room for that amount; therefore it has been decided to erect two new creameries this winter to be located at convenient points, thus lessening the expense of gathering some of the milk and cream, and relieving the present creamery of some of its heavy burden.

Milk is received and made up on any plan the customer prefers. Some is received and the cream raised by deep setting; some is centrifuged; some bought to be peddled in the village, and some is made into cheese. Of course, now that milk is worth nearly one cent a pound, the dairymen's scrub cows have lessened the supply nearly two-thirds; but in another year a better state of things is hopefully looked for, as a number of the patrons have changed from summer to winter dairying, so that, probably, the daily make of butter during the winter will be not less than 500 pounds. The new creameries will be supplied with separators or butter extractors. This season there have been 320 milk and cream patrons supplying milk from about 3,000 cows, and butter has been made every day. The firm also purchases a large amount of dairy goods from other makers, handling from September to April, from 600 to 1,000 packages of butter each month, and 250 cases of eggs each week. Apples and potatoes are also bought. Three hundred pounds of cheese were made in August—the maximum being 500 pounds—which are mostly Cheddars weighing 40 pounds each; not all, however, are full-cream, some being skims: and there are a few small cheeses weighing six pounds each.

Fairlamb, Moseley & Stoddard, and Cooley cans are used by the patrons from whom cream is gathered over 13 routes. The Fairlamb cans are, however, most largely used, and they are sold to the patrons by the creamery company at their exact cost, or they are rented to them, if they prefer to rent, at 50 cents each for the season. About one-half of the product is from gathered cream, the rest from milk delivered at the creamery. All goods are sold direct to the consumer or retailer by the firm, and the processes of creaming by deep setting, churning, washing and working, are the same as those practiced by our State experts, Messrs. Gilbert, Curtis, Munson and Green. Seven hundred quarts of milk were peddled daily during August. The milk was set in "shot-gun cans," in the "pool-room," in water at 40 degrees, until taken out by the peddlers. Five men, known as "skimmers," are employed to gather cream from the farmers, and five are employed in the creamery. The firm is composed of George Truman, George Truman, Jr., and A. Chase Thompson, the latter being the business manager and secretary. Mr. N. Haster is the general superintendent; the superintendent of the cream routes is Mr. J. Card; of the milk routes, George Nichols; and of horses, cream and milk wagons, A. Truesdel. The accountant is Mr. Lester Shay. A large building for stable purposes is to be erected near-by, and a night man will be placed in charge, whose business will be to inspect all the wagons, cans, harnesses, etc., and have each team ready for the driver at six A.M. daily. With the enlarged facilities, it is confidently predicted by Mr. Thompson that not less than 5,000 pounds per day will be the product next season.

The second floor of the creamery building is used in part as the cheese-curing room, and in part for the manufacture of cheese boxes, in which is employed a man who also does the necessary cooperage for the concern. The ice-house and refrigerators are situated in the east end of the building, the former having a capacity of 1,200 tons. The temperature of the refrigerator in which were stored the 1,000 packages of butter, was kept at 40 degrees. After a package is filled it is placed in a cooler and left two or three days to settle, when the cork in the head is withdrawn and the intervening space filled with strong brine; then the cork is driven in again, thus sealing the contents in an air-tight package. This form of package is for export, but there are some, at times, which are not exported; these are sawed in two at the center, the butter is cut with a wire; covers are made to fit each half-tub, and the packages are sold to dealers who handle only that form of package. A cellar was constructed under a part of the building at a cost of $500 for the special purpose of storing packages until wanted for filling. There are 20 different styles and forms of package, every market having a particular one, and no other. Butter goes to nearly every prominent market from Boston to New Orleans.

A large cistern for storing butter-milk is placed under-ground outside of the creamery, where the milk is stored until taken by patrons. The remainder is piped into the river near-by. The cistern is so arranged that no odors escape from it, so that none of the disagreeable and sometimes positively offensive smells that one encounters at too many creameries, are ever met with. Indeed, so particular is Mr. Thompson to have everything neat and sweet, that he is paying a large rental for a vacant lot for which he has no use adjoining the creamery, fearing that it might be used for some purpose that would be injurious to the latter. Such precautions, strict business principles, the employment of none but experts for the work, the making of only the finest goods, which always command the highest market prices, the payment of liberal prices for all milk and cream bought, the low price charged patrons for making up their milk, with the promptness displayed in the payment of all monies, are the causes which have contributed to the unparalleled success of this, the greatest creamery in the State. C. W. JENNINGS.

Rural Topics.

RUMINATION.

HENRY STEWART.

THE engraving of granular butter on page 675, in a recent RURAL tells more than words. It is now about 10 or 12 years since I sent a little dish of butter in this form to the R. N.-Y. office to be pictured as an example of what granular butter was and should be. And yet it is necessary, after all that has been written on the subject, to repeat the pictorial representation. How true it is that we need "line upon line, precept upon precept" before any truth or improvement can become established.

FIRST PRIZE BUTTER MADE FROM SCRUB COWS!! Here is another text for a homily. Mr. Cornwall seems to be rather ashamed of the fact, for he says: "But I have been using a pure-bred Jersey sire the last year."

This, however, does not detract from the credit given to the scrub cows. I dislike that word "scrub." It is too much akin to the terms "the common people," "the working classes," "the lower orders" used by so many to distinguish those people who are not rich. It is alleged to be a fact that there are more virtue, more goodness in general among these persons than among the so-called higher classes; and how would the world get along without them: for to their labors we owe everything, even the wealth which makes some people feel like gods among us. So with the scrub cows. I respect them and sympathize with them: but I do them strict justice and treat them precisely in the same way as I treat my pure Jerseys and Ayrshires.

"PAPA thinks the care of cows is more important than the breed" says Miss Leah Allen, and the young lady with grade Jerseys and native cows (scrubs) takes a first prize for her butter. No gilt-edged, high-pedigreed, blue-blooded Jersey could have better treatment than Mr. Allen's cows get. You are right, Mr. Allen, and your example is worthy of constant rumination by every one who makes butter.

MY CATTLE are the common native breed, says Mr. Fear. The herd of Mr. Goodrich is two-thirds grade Jerseys and the rest are common natives. One herd only is of Jersey cows, whether pure or not Mr. S. does not say. A most useful lesson to be derived from the narratives given by the prize-winners is this: that with good feeding, clean keeping and milking, good care of the milk and cream and good churning, it matters not what kind of cows; what churn, or system of milk-setting may be in use, the prize goes to the skillful person.

BUT WHY USE COLORING? I used to some years ago, but it was in deference to the taste of my customers who desired a high color. For seven years I have not used any coloring and my butter sells as well as it ever did. It has brought 30 cents per pound all the summer in a market where the common country butter sells for six to 10 cents. With good pasture in the summer and green (in color) clover hay and corn-fodder, well saved and cured, and the right grain food—yellow corn-meal for the bulk of it in the winter—the butter will be yellow enough to please any taste that has not been spoiled by ill-usage. Instead of coloring, the practice of feeding for the right color as well as flavor must soon have leading and popular demand in the dairy business, because it is the only honest, truthful method.

FEW contributors to agricultural journals have written more about scab in potatoes than I, and I have always associated the use of fresh stable manure with this disease or defect in the tubers. Mr. Terry's experience verifies this idea. "I am done with that kind of business," says Mr. T. I have been done with it for 10 years, at least, when, for experiment, I planted plots of potatoes with fresh manure, old manure, poultry manure, wood ashes, no manure and artificial manure, and had scab in precisely the order given up to no manure and then I had none, the fresh-manure plot being wholly damaged without one clean potato. I don't care so much for the cause of any evil if I can prevent or avoid it; although I like to learn the ins and outs of everything; and if we can avoid the potato scab, what does it matter if the cause is a disputed question. From the first, I have felt confident that it is due to a mechanical injury by some living creature, and not to a fungus, and the association of the scab with fresh manure is clear, evident and reasonable; whatever attracts wire-worms is accompanied by scab.

THE picture of Mr. Terry's tools will afford matter for rumination among the readers of the R. N.-Y. for a long time. The Western lady who wants to see Mrs. Terry's household tools would, no doubt, be satisfied; for she has no doubt everything needful in that line—a washing machine, sewing machine, carpet sweeper, labor-saving range, oil stove for summer use, hot and cold water through the house, stationary wash-tubs, drains, bath-room and water-closet, and by and by she will have electric lights through the house, with a heap of other smaller affairs which might be grouped, like Mr. Terry's small tools, in the barrel. "First make it fit for thyself in the field and then furnish the house." "The value of this lies in the application of it."

Macon County, N. C.

ILLINOIS FARMING.—My specialty is dairying on a 90-acre farm located 35 miles southwest from Chicago, six miles west from Joliet. My butter from full-blood Jersey cows is contracted by the year at 25 cents. In addition I raise a few Shropshire lambs for Easter markets which are also contracted to a Joliet butcher. Timothy hay is baled in early fall to make room for corn-fodder, and sold to stable-men in Joliet usually; occasionally I ship a carload if an unusual demand or better prices are noted in other markets. Corn is shelled next May and held in readiness for a good market and usually sold when the new crop is assured. Oats are harvested at the earliest possible date, thrashed from the field in July and sold immediately. Nine seasons out of 10 the first good white oats delivered in market bring a much better price than those sold later or until the following spring, when an account of waste must be added to the cost of production. Hogs are marketed twice a year, about June or December, and are always sold at about nine months old. Clover seed is consigned to a Chicago commission house.

How do I keep posted?

I have weekly quotations from Chicago commission firms, and market reports by the R.N.-Y., Ohio Farmer, Farmers' Review and Hoard's Dairyman, also crop conditions in all parts of the country through the above papers. The law of supply and demand doesn't govern as formerly. Failure of crops in one section doesn't mean higher prices in another section more favored. My determination to sell or hold a crop is always based on, first, the cost of production, second, the price offered, third, the condition or yield, local and general, of the crop under consideration or of sympathizing crops. It is unsafe to speculate on future prices of our staple crops. If I am offered a good margin on the cost of production I sell at once. If the price offered leaves me no margin and the conditions warrant no immediate advance I sell and put the money to the best use possible, and go to figuring to produce the next crop at less expense, but, of course, there is a limit and I believe it is almost reached in some lines. P. H. M.

Plainfield.

Everywhere.

RURAL SPECIAL REPORTS.

Iowa.

DES MOINES, Polk County, October 28.—Since my last report from this section, the weather has been very dry, and there are no prospects of any fall rain as yet. Our weather is fine for work—clear and cool—and the fall work is progressing finely. Potatoes are all harvested and corn-husking has begun in earnest. Our late potato crop was not first-class in yield or quality, though in some sections the acreage was unusually large, so that our market is glutted with potatoes which are a dull sale at 15 cents per bushel. We have an abundant crop of almost everything and everything is cheap. Winter squashes, late cabbages and turnips are the only crops we are short in. Our weather has been too dry for these crops as they are mostly made in the fall. We thought that our onion crop would be short, but plenty seem to be offered and they are dull sale at 40 cents per bushel. There is an abundant supply of good winter apples and the market for them opened at 30 cents per bushel; but they are now worth 50 to 75 cents per bushel. Corn is selling at from 12½ to 15, and oats are worth 15 cents per bushel. Cattle plentiful and cheap. Hogs are scarce and bringing good prices. A great many of our farmers are selling out; some to go West and some to get clear of their indebtedness for surplus stock and farm implements. Property at these sales is sold on 12 and 14 months time, and usually brings a good price, though these sales are beginning to get dull and the crowds who attend them are not nearly so large as formerly. I see no hope for prices on farm products to be better here soon. F. S. W.

RUNNELLS, Polk County, October 26.—We have had a beautiful fall. Corn is about half cribbed; yield not as good as expected—about 40 bushels per acre. Potatoes good except early varieties. They are selling at 10 cents per bushel. Corn is 16 cents; oats 12 to 14; wheat of poor quality and a small yield and worth 50 to 60 cents. Upon the whole, it is very discouraging to farmers, especially when it takes more than the price of a bushel of potatoes to get one bushel to market, say, 300 miles away. The inevitable is coming as fast as the wheels of time roll round, when labor will receive its just reward. J. K. W.

Nebraska.

TAKAMAH, Burt County, October 26.—We have had three unusually dry seasons here. We have had enough rain each season to make a fair crop; but the ground is drier to-day to a greater depth than it has ever been since the country was settled. A great many wells are giving out. There is every indication that things will freeze up in this condition. Things froze up very dry last fall, and although the winter was one of the mildest known, yet small fruits and especially grape-vines suffered badly. All crops are fair; corn is good and potatoes are very good; no potato rot here. Potatoes are selling as low as 10 cents per bushel delivered; but a great many were sold for 15 cents. Beef cattle are worth about 1¾ cent per pound. Money is very scarce. Hogs are about 3½ cents on foot with a good deal of cholera in the neighborhood. T. H. G.

New York.

EMINENCE, Schoharie County, October 26.—Our money crops are chiefly butter and hops. The former is made at home; almost all have creameries, some Cooley's others Reid's. Hops were not a large crop, but what we had were of fine quality. Oats and buckwheat are fair crops. Potatoes very poor—about one-third of a crop. There were but few apples. Almost every farmer keeps a few sheep. J. C. T.

Pennsylvania.

NEW BLOOMFIELD, Perry County, October 30.—There is little or no clover seed, so far as I can learn, in this county. In this immediate neighborhood there is none. As compared with previous years it is a total failure. The potato crop was seriously injured by too much wet weather and the rot. It will not be half a crop. The corn crop is unusually good—much better than the average. Wheat that was sown early looks very well; but many farmers were delayed by the wet weather, and some of the wheat is only now coming up. ANSWERS TO CORRESPONDENTS.

[Every query must be accompanied by the name and address of the writer to insure attention. Before asking a question, please see if it is not answered in our advertising columns. Ask only a few questions at one time. Put questions on a separate piece of paper.]

COTTON-SEED-MEAL AND LINSEED-MEAL USED AS FEEDS.

H. O., New Canaan, Conn.—In a late R. N.-Y. Mr. Henry Stewart said: "Cotton-seed-meal is not a healthful food for pigs." On page 677, under the head of "Tough Pork" I find this: "The use of carbonaceous food as corn, oil-meal, etc., is necessary to the finishing off of any animal used for meat." In the same issue an advertisement says: "Use with your other feed one-third linseed-meal." Just before reading the above I had told my man to add from two to three quarts of linseed-meal to a cooked half-barrel of potatoes, apples and corn, for pigs whose fattening for the butcher had just been started. What is the explanation of the apparent discrepancy in the above remarks?

ANSWERED BY DR. HENRY STEWART.

Cotton-seed-meal is cotton-seed-meal, and oil-meal is commonly understood as linseed-oil-meal. The two substances are entirely different in regard to their action upon the digestive organs and the bowels of an animal. The cotton plant has some medicinal qualities which seem to be concentrated in the root and the seed. The root has a well-known effect upon the nervous system which is connected with the uterus and causes abortion, and the oil of the seed has a similar effect. The meal produces costiveness, and its highly nitrogenous properties have a very active effect upon the kidneys as well as upon the circulation. It cannot be safely given to pregnant animals or to horses and pigs because of its highly stimulating properties. In these animals it causes congestion of the brain,—what is commonly called blind staggers. The less highly organized ox tribe may be fed safely with it if it is given moderately, but while steers and dry cows may not suffer from six to 10 pounds of it daily for a short time while they are fattening, yet cows in milk are very liable to be injured by even so small a quantity as four pounds daily, being often attacked by garget (inflammation of the udder) or by premature delivery of the calves. Linseed-oil-meal, on the other hand, is a bland, digestible substance; it is laxative and soothing in its effects. Its nitrogenous properties contained in the albuminoid substances exert no injurious effect; they are digestible and are assimilated healthfully; while the fat (of the old-process meal) is absorbed into the blood without any unfavorable action upon the circulation. The new-process linseed-meal contains very little actual fat, but about 32 to 40 per cent. of nitrogenous matter with nearly 40 per cent. of carbohydrates other than fat, among which is a large quantity of gum and mucilage. These facts are mentioned to show that oil-meals vary considerably in character, and cannot be considered in the light of food as at all similar in their uses and effects, and they should be chosen with special reference to their fitness and with a good understanding of their different characters. The feed mentioned as given to the pigs is wholesome and good. It might be mentioned, to avoid a mistake, that the whole cotton seed is fed liberally to mules in the South without any ill results. The hulls, however, act as a dilutant to the oil of the seed and the digestive ability of a mule is far greater than that of any other animal, except perhaps a beaver which lives well upon bark and the twigs of trees, and the mule cannot be made a standard by which other animals are to be judged.

KEEPING FROZEN MEAT IN WINTER.

R. B., Montreal, Canada.—What is the best way of keeping frozen meat (beef, pork and poultry) through the winter? A farmer whom I know, who grows lots of peas, packs his frozen meat in peas, and any thaw that comes does not injure the meat in the least, but we don't all grow peas.

ANS.—One of our neighbors keeps meat all through the winter by packing it in snow. A beef animal is killed in early winter while the weather is cold, and while there is plenty of frozen snow. The beef is cut into proper sizes, and strong barrels are taken for holding it. A layer of frozen snow is put at the bottom, then a piece of the frozen meat, then more snow and so on until the barrel is filled. The whole is pounded down into a compact mass, and left in the barn where the sun will not reach it. The meat is taken out as required for cooking. In ordinary winters, the meat will keep in perfect condition. Sometimes a very warm spell melts the snow. In this case, the meat must be removed from the barrel, and placed in brine, or it will soon spoil. We have read of farmers who pack such meat in wheat or other grain, but have never seen it done successfully.

SENSE OF TASTE AND SMELL IN HENS.

Several Subscribers.—Have hens any sense of taste or smell? It occurs to us that they have not.

ANSWERED BY P. H. JACOBS.

There is no doubt on my part that a hen possesses all of the five senses. She will reject ammoniated bone-meal and readily accept odorless bone-meal, though both may, in appearance, be alike. The hen has shown her partiality for spices, and she will readily detect any changes in her food before touching it with her bill. But for the senses of taste and smell she would be unable to select her proper food, and in hundreds of instances I have known hens to accept or reject certain substances, and this could have been done only by the aid of the two senses mentioned. A hen will swallow hard, odorless substances, but even then she will often drop them and attempt to detect their nature before swallowing. She depends principally on sight, as do all birds, but I have known blind hens to show a preference for foods that could be selected only by smell and taste. I have known them to avoid filthy food and odors, and also greedily to accept food slightly sea-

"Herbrand" Fifth Wheel for Buggies.

soned with salt when that substance had been withheld for a while.

THE PRICE OF THE R. N.-Y. NO. 2 POTATO.

W. G. W., St. Paul, Minn.—Last spring I purchased some R. N.-Y. No. 2 Potatoes and they were sent to my father in Chicopee, Mass. He now writes me that they have yielded very well indeed, and would have done much better had it not been for the unfortunate blight that was so general in Massachusetts during the summer. All late potatoes suffered badly, but the No. 2 did very well in spite of the blight. I shall sell a few of these potatoes and would like to know what price I ought to charge. I don't wish to charge more than the usual price and would like to know what those who have them for sale think a fair and reasonable figure for them this season. The quality of the potatoes of this variety that we have raised is excellent.

ANS.—The demand for the R. N.-Y. No. 2 is almost unprecedented. The price next spring is sure to rule very high.

PROPAGATING HICKORY NUTS.

W. R. H., Royer's Ford, Pa.—1. How should nuts, such as the Shellbark, be propagated? 2. Will the variety reproduce itself? 3. How should the nut be treated to make it sprout? 4. Can the variety be budded on the hickory? 5. What sort of a blackberry is the Wilson Jr.? 6. Is the R. N.-Y. No. 2 Potato an early or late variety?

ANS.—1. Hickory nuts for seed may be packed in boxes—a layer of sand, a layer of nuts, etc. Bury the box in a well-drained place and plant in the spring. 2. No. 3. Answered above. 4. Yes, but many will fail. Few propagators are skillful enough to meet with much success in budding the hickory. Mr. Trumpy of Parsons & Co., Flushing, L. I., is one of the successful ones. 5. The Wilson Jr. is almost a reproduction of the old Wilson Blackberry. 6. Late.

DIFFERENCE IN VALUE OF ASHES.

E. L. W., Brooklyn, Pa.—What are the relative values of ashes from a wood-acid factory and Canada unleached ashes and common wood ashes from stoves.

ANSWERED BY PROF. E. F. LADD.

An analysis of ashes from acid works, in comparison with the average of three analyses of Canada unleached ashes, as given in the last annual report from the New York Agricultural Experiment Station, shows as follows:

	PHOSPHORIC ACID.	POTASH.
Ashes, acid works	1.40 per cent.	5.55 per cent.
Ashes Canada	1.23 per cent.	6.97 per cent.

The Canada ashes have more potash but less phosphoric acid than the ashes from the acid which I analyzed. The difference in value, at present prices, for the above samples would be about six cents per hundred in favor of Canada ashes.

THE USE OF PLASTER AS A FERTILIZER.

G. S. P., Winslow, Me.—In the very interesting article in a late RURAL regarding the hay crop of the table-lands up the Hudson, land plaster is mentioned as the only fertilizer used. How is it applied? How much is used per acre; when, and how often? Is it applied on clover or on land "worn out" as is sometimes done in this State? As our main crop is hay and the soil is also a heavy clay, the successful methods there might do as much for us here, along the Kennebec.

ANS.—An ordinary application is 500 pounds per acre or one ton for four acres. It is broadcasted. It is excellent in spring on clover. It costs here about $5 per ton.

THE WILDER PEAR.

P. W., Rochester, N. Y.—In the issue of the R. N.-Y. for October 26 amongst "Wide Awake Items," I find this: "The Wilder Pear is well worth a trial." Which of the Wilder pears is referred to—Is it Fox's of California, raised by him and named some years ago, or the one put out by Mr. Green, of Clifton, N. Y., last year? The Fox seedling is a large, late-keeping pear of excellent quality, and it alone is entitled to the name. Mr. Green's is an early variety, but I don't know the quality.

ANS.—We referred to the Wilder of Mr. Green. We were not aware of the existence of another Wilder.

Miscellaneous.

F. W. E., Hot Springs, Ark.—Send a stamp to the Mississippi Experiment Station, A. & M. College P. O., Miss., for a copy of the bulletin on silos and ensilage.

W. R. A., Willimantic, Conn.—Can I get potash cheaper than by buying unleached ashes at 17 cents per bushel delivered?

ANSWERED BY DR. PETER COLLIER.

Those in charge of the fertilizer control stations of the country have given the following as the trade values of potash for 1889:

In high-grade sulphate 6 cents a pound
" chloride 4½ " " "

Quite recently a large dealer in hard-wood ashes offered them to me, guaranteeing a certain per cent. of potash; the price by the carload lot was such that the potash would have cost 12 and one-fourth cents a pound. Potash can therefore be bought for much less in the German salts than in unleached ashes.

Discussion.

POULTRY AT EXPERIMENT STATIONS.

I. K. FELCH, NATICK, MASS.—The R. N.-Y. has in times past urged the importance of making experiments with poultry a part of the work at our experiment stations. Here are a few thoughts that have occurred to me as valuable in this connection.

The public are much agitated as to the very best breeds and those that are the most practical. To my mind there can be but one way to secure a solution of this question. Each breed must be kept under the very best circumstances to make it the most profitable. To do this we must make three classifications:

The heavy or Asiatic breeds come first. These may be kept under the following conditions: Give them free, open-air exercise by furnishing an open shed attached to their quarters, and a yard sufficiently large to allow them to keep on growing continually. The feed should be three-tenths vegetable, two-tenths animal and one-half grain; the last should be wheat bran, oats, barley and corn. Corn and meal should not be over 15 per cent. of their grain feed. In the open shed there should be a box 4x4 feet filled with hay, chaff or cut straw and leaves in which they should scratch for all their feed. After the vegetable mash, with bran and meal, in the morning, let them scratch for the barley, wheat and oats. At roosting time give them the corn part of their food for the day.

The American class Plymouth Rocks, Wyandottes and Javas come next. They want the same treatment so far as shelter and runs go; let them have the same feed also, excepting that about 20 per cent. of the grain feed may be of corn.

The Leghorns may have the same yards and house quarters, but they will stand 40 per cent. of their grain feed in corn. Their vegetable and animal food should be in the same proportions.

The cost of raising birds from chicks and the full receipts from each class are important questions. Kill all males when they weigh four pounds to the pair, live weight, and note the cost per pound of raising them from the shell to that age, by weighing the whole number, male and female, when hatched and the day the males are turned off as broilers at the above weight. Kill all the females at six months old, selling them for poultry.

The three kinds of receipts, then, for each breed will be:

1. Receipts for broilers.
2. " " eggs.
3. " " fowl's meat.

less the cost of keeping them. The weighing when the broilers are killed will show which is the most profitable breed for broilers, and the supplying of these is becoming a gigantic business. The receipts from the egg will demonstrate to which breed the most profitable winter layers belong. The profits during the whole year for the food consumed will show which is on the whole the most profitable breed.

There is no breed for large, heavy roasters that will compare with the Light Brahmas to be killed when six to eight months old; but one should also find out by actual test which breed will give the largest number of pounds for the food consumed. I should say kill the Leghorns at five months of age; the Plymouth Rocks at six months; the Light Brahmas at seven months old, feeding during all the last months of their lives very heavily with hard whole corn.

Here is another item: Pick all white birds and sell their feathers separate; for white hens' feathers sell for 28 cents a pound; while colored feathers bring only six to eight cents a pound. This makes a great difference, as the feathers alone will pay dressing expenses if they be white ones.

I am conscious that for purely practical purposes the following breeds will be found to be the best;

Light Brahmas.
White Plymouth Rocks.
White Wyandottes.
Barred Plymouth Rocks.
Laced Wyandottes.
White Leghorns.

I put in the last to secure a summer crop of eggs while the others are hatching and running with their chickens. I am of the opinion that were all the Leghorn fowls emasculated it would affect the summer price of eggs fully eight cents per dozen. I mean that the incubating breeds would fail in summer as producers of eggs to fill the place of the Leghorns to such an extent as to make eggs worth that much more, so no well regulated poultryman can ignore the Leghorn race, if he is to have a uniform supply of eggs. To secure this in the best way I think Leghorns raised wholly as egg producers hatched in August and September, the most desirable, killing the cockerels either by pinching their heads when hatched, or eating them when six weeks old, when not larger than quails. The pullets raised in this way will lay a larger number of eggs during the great demand at our summer resorts than will pullets raised in any other way. This experiment may be tried also. Here is another point: The death rate in the different breeds from the shell till they are disposed of as broilers, also the amount of sickness and the number of cases of roup that result from distemper, and the number of deaths from six to 16 months old, are items that give all Asiatics a big advantage, for the death rate among Brahmas after they are a week old, is very small—the smallest among all known breeds. All the points I have named can be secured in one season in the same pens of stock, and one season's active work will give a vast amount of authentic information.

CURIOUS POTATO RESULTS.

S. B., SEAFORD, DEL.—As the subject of potato growing is one of increasing interest, I desire to give a little of my experience this summer. What I am about to relate would seem to be almost incredible, but proof will be given to any doubter who may desire it. On my farm, which is five miles west of Seaford, Delaware, I had an old strawberry bed 100 yards long by 40 wide. It had grown up thickly with clover and Crab Grass. Lengthwise it ran about east and west. At the extreme west end is a large and wide-spreading apple tree, from under which we gathered this fall 22 peach baskets full of apples. About the beginning of the third week in June, this piece of ground was plowed to a depth of five inches, a drag chain having been used on the plow to pull under the clover and high grass. In the bottom of each third furrow cut potatoes of the Mammoth Pearl variety were dropped. The pieces contained from one to three eyes each. The sod was turned down directly on the pieces. No manure or fertilizer of any kind was used. About one-third of this patch was so much under water this summer that the yield was nothing. This part was at the end of the patch opposite to the apple tree. The middle got but little cultivation, and immediately under the tree none at all, as that part though planted to within 10 feet of the trunk of the tree, was used as a play ground, and as pasture for a calf. The vines of the potatoes were either eaten off or otherwise destroyed. At the latter part of the last week in September, the potatoes were plowed out. And now for the results: We got a very few small tubers from the middle of the patch up to within 30 feet of the tree. From this point up to the tree they rapidly increased in size until we got right under the tree within 10 feet of the trunk. Right here where the ground was trodden down and so hard that it was very difficult to turn it up with a two-horse plow, and the clods of dirt had to be broken open to get the potatoes out, was the largest and finest crop that I have ever seen raised. To the south of the tree and only a short distance from it stands the home, so that the potatoes on the north side of the tree were almost constantly shaded, but just there, close under the tree, where the ground was the hardest, the potatoes were the finest, and right around and under the tree we gathered up 21 baskets, and all but the contents of one basket were extra large and perfectly smooth.

A FEW USES OF COPPER RIVETS AND BURRS.

C. W. R., CLARK'S HILL, IND.—Small economies coupled with steady application will insure the success of most farmers. Do copper rivets and burrs figure in your farm economy? Here are some of the uses to which I put them. Several winters ago I happened to snag one of a pair of rubber boots, making it useless for wading in water. They were patched by a cobbler in the most approved manner. The surface of the boot was roughened, the patch was firmly held in place for some time and then allowed to dry for 24 hours; but in less than a week it came off. I got a box of rubber cement and tried sticking a patch on myself, but with no better success. In sheer desperation I took the boot out to the shop, put a short rivet through the hole and hammered it down tightly. This answered my purpose so well that when the uppers began to crack rivets were put in the split places, thus changing the place of bending. Result: the uppers wore out the rubber soles as well as heavy leather ones that were put on before the rubber ones wore through. The boots lasted three years (being used in wet weather and in ditching) and were pretty well decorated with rivets before they were given up as useless. Rivets will fasten the buckles and straps on horse collars very securely if the straw is taken out down below where the rivet is inserted. They will do to fasten a broken line, but they make a rather rough job. Chip basket handles are made firm by using them in time. They may be used in the place of screws when joining two pieces of wood together. When wanting an extra long one, a wrought nail and copper burr answer the purpose, cutting the nail to the required length. For mending belts, splicing straps, etc., nothing is perhaps more expeditious or better. Other uses will be found for them if a supply be kept on hand. It is better to buy pound boxes of the lengths you want, for in the assorted boxes there are too many short ones.

HIGH PRAISE FOR THE KIEFFER PEAR.

"BATES," ROCKVILLE, INDIANA.—In the spring of 1886, a neighbor of mine, a thorough fruit grower, set out a Kieffer Pear tree, two years old from the graft. This season the tree bore 50 well grown pears of large size: three weighed 30 ounces and one weighed 12 ounces, and there were no small ones. The samples before me are a most beautiful golden yellow and have an exquisite blush, which any woman would envy. As to quality, while not the best to the amateur and practiced fruit-dealer, the buyer of pears in the market would select a basket of Kieffers before one of almost any other variety offered, and on tasting would pronounce the fruit first-rate. This variety is destined to become the market pear of our Western markets. It will be rated here as the Clairgeau is rated in Eastern markets. The tree is a strong, healthy grower, hardy and free from disease, and it bears at once.

LIMA BEANS WITHOUT POLES.

ELVA, BUCKINGHAM COUNTY, VA.—My garden is an acre fenced round with a picket fence five feet nine inches high. The posts are inside. I run a wire along from post to post, one foot from the ground, and another four feet above it. Two-ply cotton strings are put from wire to wire and the Limas are trained on them, being nipped off when they reach the top—five feet. If this be omitted the plant will run along the top wire. Sunflowers are also planted along the fence at intervals of four feet. In some instances the Limas got hold of one and branched all over it.

E. W. S., NORTH COLLINS, N. Y.—I haul manure on the land as soon as it is made whenever I can conveniently do so. I plow it under one or two weeks before planting time, work the land thoroughly before putting in the seed, set my grain drill to put the rows three feet apart and two kernels to the foot, which will take eight to 10 quarts to the acre, according to the size of the kernels. I open the fertilizer slide wide and put in from 200 to 300 pounds to the acre of the best fertilizer, whether the land is manured or not with yard manure, as it will keep off crows and worms and give the corn a big start which is important on cool land. I cultivate early and until the ears are well formed. In this way I grow 100 bushels of sound ears per acre and it is splendid to feed before the ears are too ripe, or cut and put in a silo. One rod of one of these rows of corn would be a far better feed for a cow than all the thickly grown corn an animal could eat. If I figure aright, the yield would make 800 feeds, each feed having the equivalent of two quarts of meal besides the stalks. How can I grow as cheap a stock feed and leave the land in as good condition? I grow from 50 to 75 acres each season.

R. C. F., SINCLAIRVILLE, N. Y.—I read four agricultural papers, so I get that old gag about fast-walking horses thrown in

about twice a month. Do the editors put it in for want of copy or do they really think they would like to plow at the rate of four miles per hour—40 miles or five to six acres per day according to the size of the plow? How many teams in this State have the nerve to do it? How many hired men are there that will follow the team? With such horses what would one want with a steam plow?

R. N.-Y. Nothing is ever put in the R. N.-Y. to "fill up." No, we do not care to run behind a plow. At the same time, when we haul a load to market, we do not want to "poke" along as many teams do. What a good many farmers want in a horse is the ability to walk fast when fast walking is required.

E. M. T., CATAWISSA, PA.—In "Discussion" I notice that E. C. B., Middletown, Pa., makes a complaint that his "Sharpless Strawberries produce berries of a different type, like the Charles Downing." This is the home of the Sharpless. Mr. J. K. Sharpless, its originator, lives here, and in showing me at one time the mother plant, stated that he thought it originated from the seed of a Charles Downing. Why should not E. C. B.'s berries resemble the Charles Downing if that be true? In my opinion they did not get "mixed." They did not "hybridize." It was simply the old law of atavism or "harking back," manifesting itself.

What Others Say.

HOW A GREAT DOCTOR WON HIS WAY.—Sir Andrew Clark, the President of the Royal College of Physicians in London, is one of the most distinguished medical men in the world. For many years, says the N. Y. Sun, he has been connected with the medical school of the London Hospital. The first clinical lectures ever given in England were delivered at this institution, and the first laboratory organized in the country for the practical teaching of physiology and pathology was organized by the London Hospital. A few weeks ago the members of the medical and surgical staff of the hospital presented to Sir Andrew Clark a portrait of himself, and on the occasion of the presentation Sir Andrew made a speech which is interesting and instructive as showing that even in these modern days the highest degree of success is attainable by those who, when they start out in life, have very few advantages, let them be professional men, business men or farmers.

"I had the habit of dealing with every day of my life as if it were my whole life," he said. "I was contented and happy over what the day brought me. I had no ambition of any kind, and I hated schemes and intrigues.

Firstly, I believe that every man's success is within himself, and must come out of himself. No true, abiding, and just success can come to any man in any other way. Secondly, a man must be seriously in earnest. He must act with singleness of heart and purpose: he must do with all his might and with all his concentration of thought the one thing at the one time which he is called upon to do. And if some of my young friends should say here, 'I cannot do that—I cannot love work,' then I answer that there is a certain remedy, and it is work. Work in spite of yourself, and make the habit of work, and when the habit of work is formed it will be transfigured into the love of work; and at last you will not only abhor idleness, but you will have no happiness out of the work which then you are constrained from love to do. Thirdly, the man must be charitable, not censorious—self-effacing, not self-seeking; and he must try at once to think and to do the best for his rivals and antagonists that can be done. Fourthly, the man must believe that labor is life, that successful labor is life and gladness, and that successful labor, with high aims and just objects, will bring to him the fullest, truest and happiest life that can be lived upon the earth."

No saying is more common among physicians than the declaration that a strong physical constitution and good health are necessary to success in life; yet there have been many instances in which the rule does not seem to have been true. Darwin, the greatest naturalist of his time, was always an invalid, and here we have Sir Andrew Clark, one of the most eminent men of the present day, telling us that he was so sickly that his life was not deemed worth a year's purchase when he began the active work of his singularly successful career.

WHICH MAY REMIND YOU.

T. V. MUNSON, one of our foremost authorities, says that the Red Cedar (Juniperus Virginiana) is one of the trustiest evergreens for Texas. He pronounces the Austrian the most successful pine.....

MR. MUNSON pronounces his new grape, named Rommel, the finest early white grape known to him. He considers Brilliant, another of his own seedlings, as resembling the Delaware though better in several essential respects.....

HE offers the promising strawberry Parker Earle for sale.....

H. A. PHILLIPS of Sun Prairie, Wis., tells Hoard's Dairyman that his herd consists of 10 cows, three of them full-blood Jerseys, and the rest grades. In 1887, his cows made an average of 256 pounds of butter. In '88, 298 pounds each, besides the cream and milk that a family of nine consumed. He also raised eight calves from their milk, mostly skimmed. His cows feed in the pasture, in summer; and he feeds four quarts of bran, oats and corn mixed, to each cow per day. In winter he feeds good hay and corn-stalks. Last winter, he fed 40 pounds of silage per day to each cow in lieu of dry stalks, with eight quarts of oats and corn—three-fourths oats, and one-fourth corn ground together. He proposes to use the same feed the coming winter. His neighbors say their cows are "mostly dry;" while his are still doing as well as at any time the past summer. Four of the cows are fresh, and more of them soon will be. They are "dry," not over two weeks in the year, on an average. He furnishes private families with butter at 25 cents in summer, and at 30 cents five months in winter. So his cows pay him well for their food and his work.....

T. B. TERRY says, in the Albany Cultivator, that an old friend of his who has been in business for 40 years, and has over $50,000 invested, told him that competition was now so great that it was with difficulty that they could hold their own. (The son is now in partnership with the father.) They do not live as well as many well-to-do farmers. They told him plainly that they were obliged to economize. He doubts whether the men have had a day off from business this year. Truly, one half the world does not know how the other half lives. With an investment of perhaps $10,000, Mr. Terry has no difficulty in living fully as well as his old city friend. His house is as well furnished and he knows he and his family have more fruit and luxuries in their season than the city friends. For about five months in the year farmers are tied up tightly and must attend right to business. The rest of the year they can be away, back and forth, as they choose, or take it very easy at home.....

HAVE you Clematis coccinea?.....

THE quality of Excelsior Sweet Corn is a trifle better than that of Early Concord. In other respects the Concord is as desirable and a somewhat heavier yielder. They ripen nearly at the same time, Excelsior being the later.....

DIRECT.

——CARL SCHURZ BEFORE THE AMERICAN FORESTRY ASSOCIATION: "The destruction of the forests of the country will be the murder of its future and its progress. It seems to me that wherever the forests cover the head-waters of great rivers the Government should keep possession. If the possession is gone, then regain it. Look at the valleys of the Hudson and Mohawk—already the flow of these rivers is diminished from 20 to 30 per cent. If the destruction of the forests continues the United States will be as completely stripped as Asia Minor."

——LONDON FIELD: "The best of the horsechestnuts is the Double-flowered, which, I believe, is of American origin, and for some time after its introduction to this country was regarded as an overrated subject; but within the last two or three years I have met with it in much better condition than previously, and can now understand the remarks of Mr. Barry, of Mount Hope Nurseries, Rochester, who says: 'The Double-flowering Horsechestnut is justly admired for its elegant form and magnificent inflorescence. The absence of fruit, by which much litter is avoided, is an important argument in favor of its employment.' My own notes concerning this variety reveal the fact that it is about a fortnight later in opening its blossoms than the ordinary kind, and consequently extends the blooming season, added to which, the double flowers retain their beauty longer than the single ones."

[The R. N.-Y.'s experience with this beautiful tree, accompanied with an illustration appeared on page 193 for 1881. EDS.]

——FARMERS' REVIEW: "A few days ago, at the Union Stock Yards, the well-known Tom Ponting was talking to a number of cattlemen, and incidentally alluded to the subject of dehorning. Said he: 'My friends, dehorning has cost me $1,000 during the past summer in feeding steers. Deprived of their horns, the cattle huddle together in the shade as close as sheep do, and the heat there is terrible. I tell you they are almost suffocated and lose flesh or make none from the food consumed. Besides this, they kill out the grass where they stand, and in wet weather poach it into mud. This discovery was a revelation to me and I believe the bad effects from crowding in the summer when heat and flies are at their worst, will more than counteract all the advantages claimed for dehorning.'"

——IOWA HOMESTEAD: "So long as the West can produce corn, wheat, beef, pork, sheep, wool and horses and lay them down in Eastern markets cheaper than the Eastern farmer can produce them, the Western farm will afford better security for an investment than the Eastern farm, and therefore the flow of capital from the East to the West is the normal condition in which both the Eastern investor and Western farmer will be profited. It will not always be so. Just as soon as there is a substantial advance in the one item of cattle, Western farmers will begin to pay off their mortgages. Sound loan companies tell us they are doing it even now, and that in the grass and corn districts real estate mortgages are becoming very scarce, even at seven and eight per cent. interest. Firms that loan at six per cent. in large sums tell us it is hard to keep their money out. With such a state of facts it seems strange that agricultural journals in the East should raise the cry that Western mortgages are unsafe. There is nothing safer. We hope in the near future they will become so secure that they will rank with the Government bond and command no higher rate of interest."

——BREEDERS' GAZETTE: "By common consent the fabled crow that dropped pebbles into the long-necked water jug until its contents rose to a hight which enabled him to slake his thirst had a great intellect. There are thousands of people, however, who in a like case seem to lack the perceptive faculties of this long-headed bird of fiction. The farmer who has cattle to sell is just now in about the same position as the raven immortalized in the pages of Æsop. Values receded into the belly of the jug some time ago, but those who have persistently dropped the pebbles of improved blood into the market have been able to get an occasional 'sip' at least. Pebbles—and good large ones, too—are just now cheap and plenty. This fable teaches their use."

——PUCK: "The pig that gets into clover thinks the sward mightier than the pen."

——PECK'S SUN: "It's a remarkable cow that knows his own fodder." "Corn in the ear is worth two on the foot."

AUTUMN WHISPERS

This is the harvest of the year,
And nature now rejoices
The while corn stalk from ear to ear
In ripe and husky voices.

Each ear smiles to its neighbor ear,
Its fair proportions praising,
And all remark the crop this year
Is surely quite a-maize-ing.

—*Chicago Herald.*

——AGRICULTURAL SCIENCE:

"THE MISSOURI AGRICULTURAL COLLEGE VS. PROF. J. W. SANBORN. You were good enough to mention my charges touching the management of the Missouri Agricultural College. Since the matter is thus before your readers, permit me to condense a volume into a few words. I have waged for the past two years a contest against the use of positions under me, as spoil for mere politicians, against nepotism in its worst form, against violent misappropriation of funds, and a general anti-agricultural college atmosphere surrounding the department for which I was in a measure responsible. Agricultural Science reaches the agricultural college workers of this country. I wish them to know that my deposition grew wholly out of a contest made not only in the interest of our Missouri farmers but in the interest of departments of agriculture associated with universities, and hence is a matter of general interest. The contest is sustained by our farmers, and already largely successful, is promising to be wholly so in the end. Pardon this personal statement, but the issue here is a public and not a personal one and more sharply drawn than has before occurred in the history of agricultural colleges of this country. J. W. SANBORN.

Columbia, Missouri, September 3, 1889."

——LIFE: "The season is now here when there is a practical unanimity on the question of a national flower—buckwheat flour."

——AMERICAN GARDEN: "Horticulture offers a field in which many lessons of value in the future may be taught. In the garden we can, not only teach our boys and girls how to grow fruits, flowers and vegetables, but we may lay the foundation of knowledge and a thirst for more, which may prove of inestimable value in later years. Study of Nature leads to the development of knowledge. Youth seeks to know the whys and wherefores of what is going on around us, and as we learn the glories and beauties of Nature we become better fitted to perform our life work, whatever that may be."

——T. B. TERRY IN THE ALBANY CULTIVATOR: "There is no honorable, legitimate business in the world that pays better in proportion to the brains and capital invested than farming."

——W. H. BOWKER IN THE NEW ENGLAND HOMESTEAD: "I want to see as rigid inspection of butter and other food products as there is of fertilizers, and when that time comes everybody will be benefited, except the unscrupulous dealer or manufacturer, who lives by his wits."

——LONDON LIVE STOCK JOURNAL: "A cow's escutcheon: The most remarkable air-bubble of modern times."

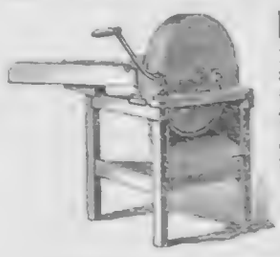
Hood's Sarsaparilla 100 Doses One Dollar

All Run Down from the weakening effects of warm weather, by hard work or from a long illness you should take Hood's Sarsaparilla, which will purify your blood, expel scrofula and all impurities, regulate the liver and other organs, cure headache, give strength and create an appetite. Be sure to get Hood's.

NOTHING ON EARTH WILL MAKE HENS LAY LIKE SHERIDAN'S CONDITION POWDER

Highly concentrated. Dose small. In quantity costs less than one-tenth cent a day per hen. Prevents and cures all diseases. If you can't get it, we send by mail post-paid, One pack. 25c. Five $1. 2 1-4 lb. can $1.20; 5 cans $5. Express paid. Testimonials free. Send stamps or cash. Farmers' Poultry Guide (price 25c.) free with $1.00 orders or more. L. S. JOHNSON & CO., Boston, Mass.



DICK'S FEED CUTTER

For Hay, Straw and Ensilage. *The only machine that cuts and splits corn stalks.* We also sell the TRIUMPH STEAM GENERATOR, and GRIFFING'S CORN SHELLER AND SEPARATOR. Write us at once. **H. B Griffing, Sons & Co., 70 Cortlandt St., New York City. N. Y.**

BOON to DAIRYMEN

Perfect Swinging Cow Stanchion. Self-locking by entrance of cow's head. Free delivery at principal points. Send for circular. Mention this paper. **Scott & Locke, Orford, N. H.**

THE
RURAL NEW-YORKER,
(34 PARK ROW, NEW YORK),

A National Journal for Country and Suburban Homes.

Conducted by
ELBERT S. CARMAN.

SATURDAY, NOVEMBER 16, 1889.

IT would probably be well for every firm in the country that has new and promising varieties of seed potatoes to offer, to advertise them in the R. N.-Y. Potato Special to be issued in about one month. In that number the prizes of the Rural's National Potato Contest, amounting to about $1,000, will be awarded.

THE R. N.-Y. begs to ask its chemist-friends a question. Upon some of the zinc-labels in use in its experiment grounds, a fine whitish powder accumulates, which destroys the lead-pencil names written thereon. Upon other zinc-labels this does not occur. How may the non-corrosive kind be determined?

TWO MONTHS ago the R. N.-Y. cut some late-sown fodder-corn and stacked it while green in small stacks. We began to feed it last week to the cows. The greater proportion of it is green and sweet, and it makes excellent food for stock. We attempted to follow the method described by Mr. C. S. Rice. A mistake was made in stacking the fodder while it was too green. Aside from that, the experiment was a success. The product is as good as any silage we have seen, and, being tied in small bundles, is easier to handle.

MANY leading horsemen are of the opinion that we are to witness a great increase of interest in the breeding of pacing horses. In past times a great majority of horse-buyers have regarded the pace as an awkward, illegitimate gait. In almost every township throughout the country can be found a farmer who owns and drives a "racker" showing more or less of the true pacing gait. While the neighbors generally recognize the speed of such a horse, they are prejudiced in favor of a square trot or a gallop. Those who have kept close watch of such matters assert that public opinion is changing and that the pacer is gaining new friends, and that within a few years his breeding and training will begin to rank in importance with the development of trotters.

HOW TRULY phenomenal the weather has been this year, not in this country only, but all the world over. Seldom, if ever, has such calamitous destruction of life and property been recorded from meteorological causes. Tens of thousands of lives and tens of millions worth of property have been lost by floods in China and Japan. British India has also suffered very severely. Europe—well the weather record in Europe has been worse than that in America. It looks, too, as if the bad record will remain unbroken till the end. Floods and tempests are still raging beyond the Atlantic; and news of a terrible snow storm and blizzard comes thus early in the year from as far south as New Mexico. Several human deaths are already reported and the fatality among live stock is appalling. Whole herds of sheep, we are told, are being wiped out, and the range for 30 miles round Dayton, N. M., is covered with carcasses. Truly 1889 deserves to be recorded as a phenomenal year in the annals of the Weather Bureau.

AMONG the varieties of sweet corn tried at the Rural Grounds the past season was the "Everbearing" from W. H. Maule, of Philadelphia, Pa. The claim was made that "it ripens a few days before the Early Genesee and that each stalk will produce one to two well developed ears. Now if these are picked when mature, one to two and even four more ears will set and develop on the same stalks during the next two to four weeks, single stalks producing during the season frequently as many as six well developed ears."

The plants grew, in a moderately rich soil, from six to seven feet tall. Some of the stems, leaves and tassels were green, others were purplish. The average number of ears to a plant was two borne from one to two feet above the soil. The ears were about nine inches long, tapering from tip to but and having from eight to 10 rows, which were generally close together and parallel. They ripened a few days after Concord.

No evidence whatever appeared of an "everbearing" propensity.

SEVERAL of the Eastern papers appear muddled with regard to the cause of the differences in the prices of agricultural products in different parts of the country. For instance, the American Economist tells us that while the farmers of Massachusetts can sell their corn for 70 cents per bushel, those of Nebraska can get only 19 cents per bushel for theirs. This great difference is accounted for on the ground that the Massachusetts farmers get 70 cents for their product because it is sold in the home market; while the Nebraska farmers can get only 19 cents for theirs because it is sold in the foreign market. This, of course, is sheer nonsense. The price paid for corn in Massachusetts is the price of Nebraska corn laid down in Massachusetts, with the cost of cartage, freight, handling, storage and commissions added. If this were not the case, why should not Massachusetts consumers buy the cheap corn of Nebraska; and why should so many Massachusetts and other New England farmers desert their home markets and go West to raise 19-cent corn in Nebraska?

LAST Thursday the General Term of the Supreme Court of New York State handed down an opinion affirming Judge Barrett's decision that the Sugar Trust agreement is criminal and that the North River Sugar Refining Company had forfeited its charter by joining it. Judge Barrett's decision was scathing against such combinations; the Supreme Court's is just as trenchant. It says that it is clear that the chief purpose of the trust was to make money by avoiding competition, limiting the supply of a necessary of life, controlling the product and regulating the price. A combination of such a character is, the Court says, subject to the condemnation of the law and "a criminal enterprise." It is a legal misdemeanor to commit any act injurious to trade or commerce, and this and similar trusts are organized for the committal of such acts, as a means of attaining selfish ends hostile to the public welfare; hence the law will neither excuse nor tolerate them.

This decision, concurred in by three out of the four Judges, is considered the most serious blow trusts have hitherto received in this or any other country. It is diametrically opposed to the principle of their organization. This is fundamentally the same in all, and therefore the decision applies to all, though, of course, each will have to be fought separately unless, anticipating their fate, they shall change their organization into a legal form. It is thought that there will be no appeal, and should there be one, it is considered certain by lawyers that the Court of Appeals will affirm the decision so strongly rendered by the two lower courts. The Standard Oil Trust, the exemplar of such organizations and the greatest of them all, is certain to be the next attacked.

RUGOSA CROSSES OF 1889—"AGNES EMILY CARMAN."

WE have just planted about 300 seeds from the white Rosa rugosa, the pollen parents being yellow Tea roses. The aim is to produce a hardy, constant-blooming yellow rose with the disease-resisting foliage of Rosa rugosa—a pretty high aim, to be sure, but one that may not be outside of the possibilities. The rose illustrated in the R. N.-Y. of three weeks ago, the first known hybrid with Rugosa, in so far as published records show, has been handed over to one of our prominent nursery firms for propagation and introduction. The R. N.-Y. has neither the time, the facilities, nor the skill to do such work. It is, moreover, against our long-time principles to use our own columns to effect the sale of anything whatever. It is probable that this rose will have to be propagated either by layering or by budding, as we are informed it cannot profitably be increased by cuttings. In reply to the many friends who have desired to purchase this rose, it may be said that it will be placed in the market so soon as an accumulation of stock warrants its being offered for sale. It has been named "Agnes Emily Carman" as a recognition of the services of one who has aided in producing these hybrid roses not less than has the R. N.-Y. itself.

CHEAP WIT.

THE first report of "Uncle Jerry Rusk," our bright and forceful Secretary of Agriculture, a full synopsis of which is given elsewhere in this issue, is an excellent document from a farmer's standpoint. Of course, therefore, it incurs considerable ridicule from some of the political papers which can see nothing except what is laughable or comical about a farmer, his vocation or anything relating to him. One is quite safe, however, in predicting that not one of the sarcastic and jocular articles and paragraphs that have tickled the fancy of the readers of the daily issues, will be dumped into the weekly editions intended for "rustic readers," although nearly the whole of these editions are hashed up from the "undistributed" type of the dailies. They ridicule the office the Secretary holds as a needless "humbug post;" and carp at his desire to enlarge its functions. They jeer at his plea for more clerks and experts and more money for a library and museum. The idea that the government should help agricultural education is "nuts" to their cheap wit, and they have nothing but a sneer to throw at the proposal to bestow more attention on crop and market reports to aid the farmer against the all-grabbing speculator. They all grandiloquently declare that "agriculture in this country is capable of sustaining, protecting and promoting itself" without government aid. The demand for an appropriation of $1,359,000 for the Department for the next fiscal year is an outrage to their parsimonious-in-the-wrong-place souls, although made for the purpose of "sustaining, protecting and promoting a calling which lies at the foundation of the country's prosperity and power." 'Oh well! let them have their cheap little joke. It pleases them and probably some of their readers, and doesn't hurt us. We ought and will have that appropriation, however,

KEEPING UP THE PACE.

A SUBSCRIBER of the R. N.-Y. who may safely be called one of the most enterprising farmers in the country, writes as follows:

"I don't see how in the world you can continue for a great while gathering such an array of useful matter for your columns. When I see what you put out every week I am thankful I am a farmer and not an editor. Say, during the busy season, I wish you would take a rest and only come out once a month, I get so behind with my reading."

The R. N.-Y. anticipates little difficulty in keeping up the pace it has cut out. It is probably because we know so little about agriculture and are so anxious to learn more, that we are able to present new ideas in a distinct and original manner. If the R. N.-Y. were to assume the part of a dogmatic teacher giving advice and information from the knowledge of its editors alone, the paper might be dull enough. There are thousands of good farmers throughout the country who have become so interested in some particular branch of agriculture that they may be said to have mastered it.

The R. N.-Y. relies upon the help of such men to make its pages bright, varied and instructive. We do not believe there is a paper in the country that has a larger list of contributors than the R. N.-Y. can show, or that has better facilities for reaching and gaining the attention of farmers who have made a reputation for superior excellence in any branch of agriculture. The R. N.-Y. takes a special pride in enlisting the services of such men and the constantly widening range of our list of contributors evidences the success of such efforts. With the help of such men, the R. N.-Y. cannot fail to improve. There is not the least danger of our running short of ideas; agriculture is too hopeful and too interesting to us. There are too many problems to be studied out, too many interesting facts to be recorded, too many methods to be compared, too many of Nature's lessons to be learned. The R. N.-Y. goes at its work with enthusiasm and with the help of its good friends hopes to do its full share in the task of ennobling and enriching the American farmer.

BREVITIES.

FEWER live turkeys are sent to this market than ever before.

SOME interesting notes on "The Cost of Living on the Farm" will be printed next week.

THE R. N.-Y.'s "Brown Patagonians" turn out to be a mixture of Dark Brahma and Polish fowls. They are fine, heavy birds, but in no sense a distinct breed.

THE R. N.-Y. grew a good crop of carrots for the horses and now finds that the animals do not care for them. We had supposed that all horses were fond of carrots.

LET the rats eat the germs from kernels of corn and then give what is left to the hens. The hens will not touch the food unless they are very hungry. What does this prove?

"I WOULD not be without the R. N.-Y. if you raised the price to $5.00 per year. It has saved me many times its cost already this year, so what I get the remainder of the year will be clear gain. W. R. S."
Mapleton, Mich.

THE R. N.-Y. is quite surprised to learn from its correspondents how general the practice of mulching wheat and rye has become. The farmers who make clover seed growing a part of their farm practice find the clover haulm a profitable mulch for winter grain.

THE new Shah Tomato (potato-leaf) was not prized very highly at the Rural Grounds the past season. It is irregular in shape, generally yellow in color though sometimes varying to an Acme and to a yellowish red. The Golden Queen is, in the R.N.-Y.'s opinion, the best yellow.

THE latest novelty in poultry is a Japanese breed, the Mino Hiki, which is to claim recognition on the strength of its long tail. "The tails have been known to grow to a length of 20 feet." (!) The breed seems to be a cross of the Game. It occurs to the R. N.-Y. that American farmers had better do something towards reducing our national egg bill before they go to breeding for "tails 20 feet long."

It seems that there is a demand in Australia for American Merino rams of good breeding. This trade has thus far been almost monopolized by breeders in Vermont, Ohio, New York and Michigan. An effort is now to be made by California breeders to secure a portion of it. California Merino breeders will enjoy advantages in shipping facilities and have also a climate quite similar to that of Australia. So at least the California breeders argue, though they will find that blood from a more northern and colder country will be constantly needed to maintain the heavy fleeces.

That wheat-growers' convention at St. Louis finally "went back" on the lead of the men who wanted to repudiate the competitive principle in the production and sale of grain and organize a gigantic trust. As pointed out in last week's R. N.-Y., the objections to such a course are exceedingly strong. In the long run hundreds of representative farmers in convention assembled are pretty certain to detect any mistakes there may be in any project offered, and the St. Lonis convention, instead of adopting the trust principles, finally resolved to ask Congress for laws to destroy all existing trusts and prevent the formation of others. On the whole, the ways of trusts, like those of other law-breakers, are a trifle hard just now.

THE much self-advertising Claus Spreckels has just opened his big sugar refinery at Philadelphia. Its capacity will be 1,000,000 pounds a day at the outset and 2,000,000 by February. His San Francisco refinery has a capacity of 1,000,000 pounds a day and he is going to build a similar one in New Orleans and has already started a building for doubling the amount of his operations in Philadelphia. These will all be completed, he says, within a year, and then he will turn out 6,000,000 pounds of refined sugar a day. The Sugar Trust now produces 8,000,000 pounds a day, and Claus with highly commendable public spirit and a shrewd eye to private gain, vows an exterminating war against it. With so doughty a rival fighting it in Pennsylvania, and the courts "knocking it out" in New York, the days of the "monopoly" appear to be numbered. Now that Claus has opened his refinery let him shut his mouth—at least for a while.

The Poultry Yard.

PREPARING FOR WINTER.

Now is the time to make everything snug about the poultry house. Have it warm, light and clean, so that the hens will be comfortable and happy. They should have protection from the cold rains of fall, especially if they haven't finished moulting. The house should face the south or southeast, with plenty of windows on that side. Some people think that all the light a hen needs is enough to find the way to bed. The writer knew an intelligent farmer, one who made farming pay, who built a new hen-house, and put just one small pane of glass in it for light; he had plenty of old sashes, too, from an old house he had just torn down; but he "didn't know as hens wanted much light." A hen will not stay in a dark place unless compelled to. Another mistake farmers make is in placing the hen-house in some out-of-the-way corner, like the north side of the barn, where nothing else would be expected to thrive. It should have the sunniest location possible, and should be so placed that the hens may have access to the sheds and barn-yard without getting into the snow, and where they will be protected from the wind as much as possible.

THE HOUSE should be impervious to wind and water. If an old house, it should be thoroughly cleaned, whitewashed liberally with a good allowance of petroleum in the wash, the roosts saturated with petroleum, (the crude is as good for this purpose as any,) the nests emptied and saturated, or burned with their contents, and everything made as clean as possible. The inside of the house should be lined with tarred paper, with the laps covered with laths to keep the paper snugly in place.

THE ROOSTS should be placed low down, and all on the same level. The old fashion of building the roosts like a ladder is a very pernicious one. The hens all want the highest places like the Scribes and Pharisees of old, and crowd each other to get there. A board should be placed under the roosts to catch the droppings, sprinkled with land-plaster, dry earth or sifted coal ashes, and cleaned off frequently—every day is not too often. The roosts should not be too narrow especially if the fowls are heavy. Inch boards cut into strips three or four inches wide are best. Make everything smooth so as not to harbor vermin.

THE NESTS should be arranged so as to be dark to prevent the hens acquiring the habit of egg-eating.

THE FEED BOXES for feeding soft feed should be so placed that the hens cannot get into them with their feet. The best arrangement is an alley two or three feet wide running the length of the building, separated by a lath partition, through which the hens may reach the feed placed in troughs in the alley. The nests and roosts may also be placed next the alley, so that the eggs may be gathered and droppings removed without going inside the pens.

THE FLOOR should be covered with several inches of dry earth, and littered with straw among which the grain should be scattered. Provide also a dust-box, and box of bone, gravel or other grinding material. Don't forget, also, to provide suitable drinking vessels. The man still lives who claims that hens don't need water. The man also lives who thinks hens don't pay. Well, they don't pay—some folks—and no wonder.

GREEN FOOD also, should be provided; cabbages are excellent, and soft heads may be utilized if buried. Clover is also excellent either siloed or as hay chopped and steamed as wanted.

WINTER LAYERS. Early-hatched pullets and early-moulting hens are best. Don't be foolish enough to think they will not lay if deprived of a male companion. They will lay just as many eggs, if not more, and the eggs keep better if not fertilized.

BREEDING STOCK should be selected from the best layers. On most farms, one pen of a dozen or 15 hens will furnish all the eggs required for setting. One cock is sufficient for that number, unless he be a Brahma, when two will be required. Now, what earthly use is there in keeping a half-dozen or more roosters to worry the hens, and eat the provender when only one is needed? Select a dozen or 15 of the best hens or pullets, and put them in a pen by themselves: then get a rooster of different blood—a full-blood can usually be purchased very cheap in the fall—and you are in a position to improve your stock at least 50 per cent. The old haphazard way of setting eggs from the flock at large should be a thing of the past. Decapitate the rest of the worthless cockerels, and hold a thanksgiving feast over the remains. You wouldn't think of raising calves from your poorest cows to replenish your dairy, now, would you? You would most likely select the best cow for a breeder. Why not follow the same rule with the poultry and improve the stock?

Field Crops.

BUCEPHALUS BROWN'S NOTIONS AND IDEAS.

THE POTATO CROP has been harvested, and in New England is, to a great extent, marketed. The very early spring encouraged extensive planting, and the absence of frost after April 1, prevented anticipated losses from that cause; so that up to August 1 there was the general expectation of an immense crop, with consequent low prices. I understand that many R. N.-Y. readers are anxious to know the outcome of the large area planted by one of my neighbors, to which I referred some time since.

SIXTY ACRES is a large area indeed for a single farmer to plant with potatoes in this section, and the experiment was regarded as extra-hazardous. The whole work of planting, cultivating and harvesting was done by machinery, and the first 18 acres were got in so early that they were fairly well matured before any disease appeared, the crop being about 200 bushels per acre, sold at 80 cents, less commissions and freight.

THE FORTY-TWO ACRES remaining began to blight very early in August, and soon the tops were entirely dead. The feeling was that the crop would be very small, and the tubers inferior. Rot was likely to make them not worth digging. This crowning misfortune, however, did not appear, and, as digging proceeded, it was seen that things were not so bad as to leave no profit from the adventure. I have just received the figures of the entire crop on the whole 60 acres, which are as follows:—8,958 bushels sold at an average net price of 49 cents per bushel; 800 bushels reserved for seed, 100 bushels on hand, besides the small potatoes from the whole crop. The entire expense of seed, fertilizer, planting, cultivating, and harvesting was $2,100, or $35 per acre.

THESE FIGURES show that even in so unfavorable a year a very fair profit was possible; and it seems to me evident that it was insured, under the circumstances, only by the liberal fertilization of 1,000 pounds of Stockbridge Potato Fertilizer per acre, at a cost of $1,140, which was more than half of the total expense. I say this with the more assurance, because my own crop of 10 acres, planted at the same time, on similar land, with 600 pounds of the same fertilizer per acre, did not quite reach 100 bushels per acre. I do not see any reason why the extra 400 pounds of fertilizer did not give my neighbor his extra 65 bushels per acre.

TAKING ACCOUNT only of cash expenditures and receipts, there was a net profit on the crop of $2,289.42 I do not understand that my friend's personal labor, or the cost of the team work of his own horses, the wear of implements, etc., are included in the $35 per acre of expenses; but these are well offset by the potatoes left unsold and reserved for seed.

SOME LESSONS are to be learned by this experience, and the most striking one, perhaps, is that blight and rust may together destroy the life of the potato plant without causing the tubers to become diseased. This knocks over quite a number of theoretical opinions on the subject. Allowing that the rot is really caused by the blight or rust fungus running down the stems into the tubers, how can the fact that scarcely any rot appeared in this crop be explained? It may possibly be said that if the rot is caused by the rust fungus, then the early advent and rapid work of the blight prevented the spread of that fungus to the tubers by suddenly killing the tops, allowing them to dry up so quickly and thoroughly that the rust fungus could not reach the tubers.

THE PAST SEASON has been a very exceptional one, and for that reason its teachings are of limited value as a guide to future practice. It has been a phenomenal year all around. No frost from April 1 to October 5, in northern New England is a thing almost if not quite unknown in past experience. A very warm May was followed by a cool June and July, with much rain and very little sun. Early September was warm and dry, followed by three weeks of wet weather. Since October 7, fine harvest weather has continued up to the present date, October 21.

Miscellaneous.

MORE ABOUT SELLING CROPS.

CANADA.

OUR principal crop here is wheat, and as our prices are ruled by those in the European markets and the quantity in view from other countries as well as our own, to ascertain these points we have to rely on the reports in what we think the most reliable newspapers at home and abroad. We study them and act accordingly. I have sometimes kept grain over two seasons when I thought it too cheap, and have gained by doing so sometimes, but as often lost, if not in price, by shrinkage in different ways. The market is so much ruled now by millionaire bulls and bears, that it is very difficult to tell how it will turn, and therefore I think that, taking one year with another, when we can get a fair price it is best to sell early; but when prices are very low I would risk keeping the product back. T. B. M.

Hamilton.

CROPS around here are generally sold as soon as harvested. The producers keep themselves posted by studying the daily papers and through commission merchants.

St. Catharines. A. J. D.

I RAISE only small fruits and market them at our home market in the city of Hamilton. I find that by growing number-one stuff I establish a ready sale to my own customers. I start with strawberries, raspberries, blackberries, plums and peaches, and close the season with grapes and apples. T. S.

Grimsby.

KANSAS.

IN selling winter wheat we depend on papers from Kansas City and Chicago, to keep us posted. We generally hold till late in spring, as prices are then generally higher, though we are governed somewhat by the prospects of the next crop.

Hogs, we sell as soon as they are fat, feeding all the year round, generally waiting to make a car-load, so as ship to Kansas City ourselves. Cattle we commence feeding in September or October and feed about six months till spring, and sell without letting them have any green grass in the spring till sold. J. H. T.

Chapman.

Woman's Work.

CONDUCTED BY EMILY LOUISE TAPLIN.

CHAT BY THE WAY.

WHAT are you going to do during the long winter evenings? Now is the time to plan amusements and occupations for the coming season. Crochet work and gossip,—we don't mean ill-natured gossip, but just trivial talk about persons and things,—will form the evening's occupation in a good many households. As to the first, a little crocheted edging is all well enough, but it should not be allowed to exclude other work. Apart from the fact that change is desirable and bought edging cheap, it is tiring to the eyes. But individual taste must decide this.

* * *

CHANGE of work is desirable, so let the "pick-up" occupations vary from crochet work to embroidery or outlining or drawn work, or whatever may be chosen. And as a relief from aimless talk which may easily degenerate into ill-natured gossip (for few among us are above this occasionally,) let some book be chosen for reading aloud. Where there are several readers to take turns, this becomes both pleasant and profitable to all. We don't recommend confining the reading to those books which are severely described as "improving," rather than anything else; they should be pleasant also. In addition to history, travels, biography and general essays, some good novels should be read. Where there are young girls, Miss Alcott should have a place of honor; so should Miss Mulock. We wish that every romantic girl, who thinks she is suffering from crushed affections, could read the latter's pathetic little story "Miss Tommy," or "My Mother and I." But this authoress is so fully a woman writing to women, her purity and high-minded simplicity make her an educator among girls.

* * *

BOOKS are not always plentiful, but one may usually find something to read, and let it always be the best obtainable. After all, the girl with a taste for books which she can't always obtain is better off than one with plenty of books and no appreciation thereof.

THE EAST WIND.

OUR CORRESPONDENT, Docia Dykens, writes as follows in a recent letter:

"There was a criticism of some length in the paper on my remarks about the "East Wind," and it was just a little unjust to accuse me with having merely repeated remarks garnered from English books. The editor's theory in regard to the east wind in this country may be correct as a theory, but practically it is not applicable to this particular spot on the globe. I live on an island in the lower end of Lake Erie. The lake is frozen over just about three months. When the ice breaks up in the spring it *always* floats down towards Buffalo and lingers there for weeks after this part of the lake is clear of ice, consequently the winds from the east blowing over all this ice are extremely cold and piercing, and often bring large fields of ice back to our channels here. We have more east winds in the spring than at any other season; but at any season a northeaster on the la e makes the roughest sea we have. Our prevailing winds through the summer are from the west and southwest, the latter being especially mild and delightful."

THE FAMILY PAPER.

J. H. G.

I HAVE noticed that many farmers' wives and daughters oppose the taking of an agricultural paper in the same way as a professional or business man takes a paper. They do not think the men folks can afford to take a paper devoted exclusively to their calling. They want a story paper which contains acceptable stories; no matter what else it may contain, it is good enough for the family. In this they make a great mistake. From such papers the boys and the girls get false notions of life. Instead of fostering a love for the homestead and the old folks, such papers tend to induce the boys to go out into the world and make their fortunes and marry an heiress, as the heroes in the stories do; or the girls want to acquire the bewitching ways of the heroines they read about and marry the son of a millionaire or a foreign nobleman. When it is too late the mother discovers that she has been nursing the Demon of Discontent, until her family has been ruined by him. There is no better or more exalted occupation in life than that of agriculture and home-keeping, and mothers should see to it that only such papers as exalt agriculture and home life should be allowed in their homes. Infidelity is doing its devilish work in American homes, as well as in American churches. The mother who is quietly and unostentatiously teaching her boys and girls that there is no place like home, be it ever so humble, and who is tying them fast to her apron strings with the golden chains of love and reverence, is doing a far nobler work than she who is trying to make her children brilliant. The one means it may be moderate success with an assurance of health and happiness; while the other means in all probability lamentable failure and misery. No farmer's wife with the true interests of her family at heart will ever begrudge the price of a good agricultural and home paper. If your husband will not subscribe for it, make your eldest

boy a Christmas present of it, and get it in the family.

LETTERS TO A COUSIN.

IV.

MY DEAR COUSIN:—And so you have read "Looking Backward," and you think the idea altogether chimerical. Furthermore, you have no patience with a man who would fall asleep on the eve of his wedding day and sleep 112 years, and then wake up and fall in love with his sweetheart's grand-daughter (as witty as ever); lastly, you are not particularly interested in social reforms. Very well, my dear cousin, but you shall not be left in ignorance by the wayside. The demand for Edward Bellamy's book has been phenomenal, the sales averaging 1,100 copies per day. The clever plausibility of his schemes has captivated many readers. "Yes" (I hear you say) "people like to be humbugged." Of course that is all true, but do let us be humbugged in a new way just for a change. We are rather tired of the old. Two new clubs, the Nationalists and the Christian Socialists, that were organized in Boston, and now have members all over the Union, have adopted many of Bellamy's ideas. The Christian Socialists urge the members of their club to live up to their own creed of treating all mankind as brothers. Their organ, "Davon," has on its list of contributors the names of many prominent writers, among others being those of Rev. Dr. E. E. Hale, Col. T. W. Higginson, Mrs. Helen Campbell (who wrote "Prisoners of Poverty") Rev. Dr. Heber Newton, Rabbi Schindler and Edward Bellamy. Now, will you still elevate your head and say with withering scorn and a fine show of incredulity that the book is all "bosh" when some of our most earnest thinkers pronounce it good?

The Nationalists also have an organ, the Nationalist, which has a very wide circulation. They, as their name indicates, put their hope in the nationalization of all industry, and claim that combination and not competition is the life of trade. So much for that subject. I will not go into details, for I am pretty certain they would bore you, and sometimes I do have a little consideration for the person to whom I am writing.

The Library Association of S——are giving a course of lectures this season that promise to be very interesting. The Rev. Frank W. Gunsanlus, of Chicago, lectured on Savonarola, the Italian priest and reformer, on the opening night. He gave a brief sketch of the agitator's boyhood, then dwelt at some length on his life and work among the Florentines (George Eliot vividly describes this part of the man's life in Romola), and finally, in a striking word picture portrayed the tragic end. Mr. Gunsanlus is a very enthusiastic speaker, and carries his audience right along with him. A friend told me that last year, at Chautauqua, some one asked for a definition of eloquence, and a gentleman arose and answered "Frank W. Gunsanlus, we considered him the personification of eloquence." Perhaps you remember him when he was pastor of Eastwood Chapel in C——and afterwards filled the large opera-house Sunday afternoons with wide-awake people. That was eight or nine years ago, and he was said to be only twenty-three then. We all thought him wonderful, but people predicted that he would not last long, and thought he was killing himself by hard study. Socially, he was very much beloved. At a picnic he seemed in his element and would crack jokes all the way home, riding in the tail-end of a big wagon with his long legs swinging almost to the ground. A pretty young girl who taught in his Sunday-school was worrying over her graduation essay and he kindly offered to help her. Of course, she got along swimmingly then. I've forgotten what her subject was, but it was something big and when she handed it in, the Principal of the school read it over and then looked up with his keen, black eyes and said quietly: "Who helped you with this?" "Mr. Gunsanlus." "Very well, suppose you go home and write one yourself now." Mr. G.'s family consists of his wife, two or three little boys and a sister. At home he was just a big boy romping with the little boys. His sister took one or two special studies at the school I attended, and was considered very intellectual; indeed, her talented brother used to say that she was the flower of the family. I haven't heard of her for a long time. I believe she married. Mr. Gunsanlus always managed to have the best musical talent in the city at his church. He used to say he could not preach at all if there was no music, but after a grand solo he always felt inspired.

Speaking of music, I went to hear Emma Abbott a few weeks ago in the opera, "Romeo and Juliet." Her costumes were gorgeous; but Emma herself is not as pretty as she once was, nor is her voice anything wonderful. Moreover, the character, "Juliet," is not at all suited to her style. But something occurred that made the evening exceedingly interesting, and I wonder if I can make it appear so to you. To begin with, there were three in our party and I occupied the third seat from the end of the row. Just in front of us, occupying the first and second seats, was a large, light-complexioned man and a slender, nice-looking young lady. He was the most voluble talker I ever heard, and you perceive that when he turned to talk to the young lady he also came very near facing me—so near, in fact, that it was quite impossible to avoid listening to the talk that flowed on incessantly. It was also impossible not to be amused. He had deep, glittering blue eyes and a long, light beard, and I quite forgot to say at first that he was a German and talked in his native tongue and was evidently well educated. He talked of music, the drama and a hundred other things, to which I, of course, gave little heed. But suddenly my attention was arrested by these words: "Will you have me for your husband?" (literally translated) Imagine! Could I have heard aright? Yes, there was no mistaking the look with which he was regarding his companion. "Heavens!" I whispered to F. "That man has just proposed to the girl!" She evidently gave him a negative answer for he looked furious and exclaimed. "Very well, I will take you home and we will break this right off to-night." Oh me! I asure you that the stage "Romeo" only had half of our attention after that. The curtain rose on the last act, the poison scene, and the irrate Teuton would cast swift glaces from the stage to his companion and utter a word or two under his tawny beard, which seemed to mean that he would do something equally desperate. The young lady had grown quite white and kept her opera glasses up to her eyes to avoid *his* gaze. I, too, had to fasten my attention on the stage, for he seemed to comprehend that I had understood and told, and consequently stared at me in a most annihilating manner. Nevertheless, I have lived to tell the tale. We watched them leave the theater and walk three or four squares, he on one side of the pavement, she on the other. Well, dearest, so much for having bestowed a little of my precious time on the study of German. "A little learning is a dangerous thing." It has certainly made me one enemy. We all agreed that the girl did perfectly right to refuse him, but if her answer had been different our amusement would have been greater, for I beleive he would have made himself quite ridiculous. Criticize me if you will, but do it with loving skill.

Affectionately, DOCIA DYKENS.

GOLDEN GRAINS.

TALMAGE says it is a good thing to graduate at the Royal College of Trouble. These graduates are in all the higher and nobler walks of life; in all the more illustrious ranks of the redeemed. Have you not observed that many of our greatest and most effective writers and reformers have been fitted for their special work by the baptism of tears? When men receive the honor of knighthood, they are touched with the flat side of the sword. When men are set apart for the honors and dignities of the Kingdom of God, they are pierced by the sharp point and cut by the sharp edge. Suffering is the road to perfection alike with individuals, nations and the world itself. All is necessary. Paul suffered much, but Paul could not afford to dispense with one shackle, one scourging, one pang. It was training. It was the royal school of trouble. It was the road to perfection.....

THE Christian idea of repentance, says Dr. Eaton, involves two chief elements—the changing of one's mind and the reformation of one's habits of life. It is not enough for a man to say before the altar that he is sorry for his sins and then go out into the world and commit the same sins again. It is not enough for a drunkard to repent of drunkenness and then continue in drunkenness. The sinner who has really repented will no longer sin; the drunkard who has repented will no longer use false weights and measures; the politician who has repented will no longer tamper with the consciences of voters, or seek to buy his way into public office, and the minister who has repented of indifference and coldness will no longer try to bring his hearers to Christ by half-hearted services.....

DR. COLLYER reminds us that we never speak of Washington as an old man. He was struck with immortal youth. Washington did not ask if life was worth living, but he proposed to himself to make life worth living. His great watchword was "duty"—not pleasure, not the pursuit of money as the end of life and living, but "duty." In the wilderness, on the battle-field, in the market, in the camp, in the council he was a man of amplest influence. Everywhere they found him asking: "Is this my duty as a Christian?" A whole man, and therefore a holy man, his great example stands colossal seen of every land. "The path of duty was the way to glory."

BEECHER says that every man is for truth, or he is for error. Every man is for right, or he is for wrong. Every man is for benevolence, or he is for selfishness. Every man is for the spiritual, or he is for the animal.....

IN what other painful event of life has a good man so little sympathy as when overcome with sleep in meeting time? In his lawful bed a man cannot sleep, and in his pew he cannot keep awake!.....

IN reply to an inquiry, Lyman Abbott defines Mr. Beecher's position on the subject of Christian Evolution:

"Evolution" signifies the derivation of all the various forms of life from a common origin, by progressive change, according to certain laws, and by means of resident forces. It is best typified by the course of embryonic development. "Christian evolution" is a phrase which represents the belief that the efficient forces of such a process are the energy of God in Nature. Mr. Beecher so believed. See his book. Christ's saving work, as he taught, includes all that Jesus did and said and suffered. The death of Christ, in Mr. Beecher's view, was no less a part of his saving work than his life.....

Domestic Economy

CONDUCTED BY MRS. AGNES E. M. CARMAN.

"The tissues of the life to be
We weave with colors all our own,
And in the field of destiny
We reap as we have sown."

—Whittier.

EXTRACTS FROM SUNDAY EVENING TALKS AT THE RURAL GROUNDS.

"FOR unto whomsoever much is given, of him shall much be required: and to whom men have committed much, of him they will ask the more."

"We must make some allowance for him, because he does not know any better!"

"There is no possible excuse for him, because he ought to know better!"

We have all heard these expressions; we have doubtless all thought them when considering the shortcomings of others. It seems to be natural for us to look at things in that way. It seems to be a part of the natural justice that lies at the base of all our thoughts and feelings to believe that education and study carry with them a certain responsibility, while the lack of them, to a certain extent, absolves one from responsibility. Whether right or wrong, this idea holds. We are always shocked at witnessing an act of rudeness on the part of one who has had every advantage of polite society. The rough fellow, who never had any "bringing up," may disgust us by his ill-manners, but we are far more ready to find excuses for him than for the man who "ought to know better" because of his education and associations. And so it is with other qualities. The just critic always considers this matter of education before forming a decided judgment. A little reflection will convince all of you that this is true. With this fact in mind, two things occur to me that I think are worth considering.

First. Education of any kind involves a responsibility that cannot be dodged.

Second. No man or woman who wants to be self-respecting can afford to go through life taking advantage of the leniency granted those who fail to assume this responsibility.

I believe in a doctrine of strict accountability. The country contains so much wealth. One man by earnest application and hardest toil accumulates millions. Will he not be held responsible for the spending of his money? Will there be for him only praise for the energy and perseverance displayed in gathering it together? How much good have you done with your wealth? How have you invested it so that heavy hearts have been made lighter, so that light has chased away shadow, so that the world has grown better and happier? It seems fair enough, to me, that such questions will be asked of the man who is rich in this world's goods, and that a rich reward may be due the one who, by means of honest and manly effort, accumulates a fortune and spends it so that the world is made better. There need be nothing necessarily wicked about the accumulation of a fortune. Too many who accumulate money forget about the responsibility that goes with it.

It is much the same way with an education—and by education I mean the information we may acquire concerning any subject—it makes no difference what it may be. We should remember that the moment we learn the difference between the right and the wrong of any matter we assume a new responsibility. We are not as we were before. When held to a strict and fair account, we cannot plead ignorance as an excuse for any dodging of duty on the lines included in the scope of our study or observation. The accumulation of mental wealth, reading, thinking, observing, entails a responsibility as certain as that following the gathering of money. Why should we not be held to a strict account for the information we acquire? How have you used your learning? In how far has it taught you charity, patience, strength of character, ability to withstand disappointments and losses, ability to advise and comfort others? And how far have you made use of this ability in your intercourse with those about you? Why are not these questions as fair and just as those that may be asked of the rich man? It is safe to assume that when the final summing up of our lives takes place, such questions as these will be considered.

It is the duty of the even-minded human being to do his best to cultivate and improve his mind. The mind is the richest, most delicate gift that God has given us. It is the index of life revealing our thoughts, our lives, our mental struggles and investigations clearly and honestly. The training of this mind is the life-work assigned to every human creature, and it is fair that we should be judged by the showing we make at the end. Live a blank, vacant, purposeless life, filled with thoughts only of present and future pleasures, stale commonplaces in the way of thoughts and a course of reading that brings nothing but amusement, and what sort of a mind do you turn out?

No, God meant, when He placed within your reach the great privileges of thought and study, that you should be held responsible for the use or abuse of that privilege. The world has been filled with opportunities for drawing in strong, beautiful and helpful thoughts. Good and true men and women have left the records of pure and beautiful lives for us to ponder over. Great minds have left strong thoughts for us to study and apply to our own needs and our own circumstances. Nature is filled with the most wonderful examples of the certain results that follow a true observance of the laws of life.

Do you not believe then that the human being who, in the midst of all this wealth of information and wisdom, fails to grasp what he can, fails to draw into his own life and soul a portion, at least, of the sweet examples of patience, fortitude and strength, that other lives have left us, that dumb lives are acting before us every day, fails to live up to his possibilities and fails to carry out the work God gave him to do? Who is worse, the one that knows the difference between right and wrong and then

Miscellaneous Advertising.

When Baby was sick, we gave her Castoria,
When she was a Child, she cried for Castoria,
When she became Miss, she clung to Castoria,
When she had Children, she gave them Castoria

fails to do right, or the one that fails to accept an opportunity to learn the right and then pleads his ignorance as an excuse for wrong-doing? It is my belief that the latter is as deserving of punishment as the former.

So I would have every boy and girl, every man and woman impressed with the idea that it is their duty as reasoning human beings to cultivate and improve the mind—to acquire information—just as much as it is their duty to preserve the health of the body. Both have been given us in trust, when we hand them back they will be examined and measured for progress. That is fact one. Another fact is that education is a serious matter since every fact we assimilate increases our responsibility and decreases the number of excuses we might reasonably offer for wrong doing.

A HOUSEHOLD cannot thrive whose mistress does not realize the value of *fixed times* scrupulously adhered to.

ODDS AND ENDS FOR THE HOME.

FOR years somber mahogany, walnut and ebony held sway. Now, however, light woods, such as antique oak and ash, are used in preference. They give a cheerful, light tone to a room, and save the housekeeper lots of worry, for the highly polished dark woods always appear with a coat of dust, despite repeated brushing and dusting.

* * *

SUPERABUNDANCE of ornament, both in the way of pictures and bric-a-brac, wearies the eye and obtrudes unpleasantly upon the notice. It also gives one a heavy or depressed feeling to go into a room which is overcrowded in this manner. Too little ornament is also to be avoided, for this latter condition makes an apartment look bleak and bare. A happy medium is best.

* * *

SECURE a large proportion of plain neutral tints in your rooms. Positive or brilliant colors shou ld be used only in small portions.

* * *

PLAIN colors are more restful to the eye than any regular "pattern" can ever be. It is best, therefore, in the room where one spends most of the time—where one works—to banish patterns as much as possible.

* * *

NARROW oak frames, about three-quarters of an inch to one inch wide, are very pretty for etchings, engravings, or water-colors. To my mind plain frames are the best. Who has not seen an elaborate gilt frame, inches and inches wide, containing a tiny color or print in the center? To me this is ridiculous. The *picture* should be the noticeable thing—not the frame. Plain, flat, natural wood frames showing the grain, are very pretty indeed. We are glad to see that they have been growing in favor for the last few years.

* * *

ANOTHER departure from the gaudy, glaring, gilt frames formerly the rage is a plain flat frame made of wood, with a thin coat of silver. The grain of the wood shows through and is very effective indeed.

* * *

ANOTHER cunning device is to extend the picture, or portions of it, across the smooth, flat frame. While in an art gallery in Philadelphia a short time ago, I saw several pictures treated in this way. One represented a limb of an apple tree, filled with soft pink-and-white blossoms. On the limb perched a bird, with its mouth open as if singing! The bough ran diagonally across the picture from left to right and continued over the frame, which was of flat natural wood about four or five inches wide. On the upper right-hand corner of the frame above the branches was a flying bird—probably the mate of the songster on the bough. The effect was lovely in the extreme.

* * *

ANOTHER represented a chained lion and tiger. The picture was large and the chains were apparently of heavy metal. Where the chains ceased in the picture they commenced on the frame, only on the latter they were made of metal and fastened to a stake. The effect was very good and one could scarcely detect where the picture ceased and the reality began.

* * *

STILL another, treated in the same way, represented a sea beach. Off in the distance the fishing smacks were visible. On the beach were several men and boys, some preparing to leave, while others were mending their nets. The nets were spread on the sands and extended across the flat frame, only on the frame they were made of the real material.

* * *

MONEY alone cannot make artistic homes—unless one who has money and no artistic taste hires the proper person to spend the money for him. Refinement cannot be purchased at will along with expensive articles of dress or furniture. It must come by education in the principles of art, and, therefore, takes time. True culture is a growth, not a garment.

DORA HARVEY VROOMAN.

LIFE says that a skillful cook is the most popular of all interior decorators.

MUNSEY'S WEEKLY: Mr. Filosopher (handing his wife a 20-dollar bill): "Woman is an enigma."

Mrs. Filosopher: "Thanks, dear. But why did you make that remark?"

Mr. Filosopher: "She will face a frowning world and cling to the man she loves through the most bitter season of trial and adversity; but she wouldn't wear a hat three weeks behind the style to save the government."

JOSEPH JEFFERSON in his Autobiography in November Century writing of "hard times" says that his mother was a brave woman and endowed with that kind of pride that preferred the degradation of earning an honest living to the more elegant profession of getting in debt.

"The tongue is the key of the mind:
And whenever it opens the secret-hung door,
What lies in the storehouse behind,
Whether gems or mere rubbish is hidden no more."

HEALTH OF MOTHERS.

"I BELIEVE it is a positive sin for me to be sick," says one mother, "for I never can feel or act like a Christian when I am ill." All women certainly should desire to be well and strong, and mothers particularly need the blessings of health, yet how pitifully few of them are free from bodily ailment. So many requirements of their lives are opposed to the best conditions of health, that, unless special care is taken, illness seems well-nigh unavoidable.

The numerous, varied, and continual demands on time, strength, patience and every mental and moral faculty, are exhausting in the extreme, and unless one is able to marshal sufficient physical force to meet them fairly, life can be little else than a burden. All honor to those rare, beautiful souls who have learned to bear invalidism with patience and sweetness! But the accomplishment is too difficult and doubtful of attainment for most of us, and she who would best minister to her loved ones should make all possible effort to secure and to keep good health.

If mothers fully realized how much health depends on the amount of pure air taken into the lungs, they would at least try to breathe better. They do have time for that, if not for regular out-door exercise. What a grand thing it is to *breathe*—really breathe—long and regularly to the very depths of one's lungs! It is restful and invigorating, yet thousands of women never know this luxury, simply because their manner of dress will not permit it. If only women *would cease* to consider corsets a necessity! If they would only assert their rights and declare themselves free from the thralldom of that health-destroying implement! But they won't! They will continue to spend money that might mean shoes, or bread, or bibles for somebody, to squeeze the life out of themselves. Not that they ever wear corsets tight—oh no, "why you could put your whole hand under" every time; and then if they didn't wear them, they "would drop all to pieces," you know. Their muscles so long cramped and insufficiently nourished have not strength to be self-supporting, and they probably would fly into thousands of fragments if corsets were removed.

Men are much healthier than women and corsets are undoubtedly mainly responsible for this difference, yet multitudes of women might believe and know that who would continue to wear them just the same. They would tell you how nice they think it must be to be well and strong; but then they "would be of no shape at all without corsets." Besides, if they should get very sick there are plenty of pills and powders and liquid swindles at $1 per bottle, the swallowing of which is much less bothersome than the doing of some sensible thing in the way of dress and exercise; and so their precious God-given health must be sacrificed for *looks*! But Dame Nature has her own tyrannical ways and will not accept medicine as a substitute for pure air. Her method of purifying the blood is to let plenty of oxygen into it, and if people will prevent the free action of the lungs they must sooner or later be severely punished. A whole army of diseases just outside the human citadel lies in wait to attack the first weak point. Strengthen every part that it may successfully resist disease, and the secret of good health is won. As there is no strengthener like pure blood and no blood-purifier like pure air, common sense and religion teach the folly and sin of disregarding human nature's grand processes.

But wrong as it is for any one to do this, the crime seems tenfold greater when *mothers* ignore the righteous laws of human life and health. If mothers and all the dear girls who may become mothers, would breathe, dress and exercise properly, the dawn of a healthier, happier era would be at hand. Consumption, rightly called "lung starvation," would be well-nigh impossible if right breathing were always practised. Thousands of people who seek health in Florida and elsewhere, might get well at home if they were willing and persevering enough to make right use of their lungs. If pure air could be sold by the bottle or the pound, it might, perhaps, be more properly regarded; but it is so cheap and so abundant—to be had, like salvation, simply for the taking—that its curative powers are greatly underestimated.

Oh! mothers, weak and exhausted with your many cares, threatened, perhaps, with disease, but without time or means to take expensive journeys, even though you die, try this simple remedy—not spasmodically, but regularly and persistently. It will help you far more than all the medicine you can take, and it will not cost you a penny either. Take care of your bodies, dear mothers; they are the soul's necessary machinery during this life, and one's best work can never be done unless the machine is kept in harmonious working order. It is a religious duty to keep as well as possible and mothers owe it to the generations following to bequeath them as perfect health as lies in their power. Take needed rest and recreation, take rides and walks and frequent baths—and daily naps, if you can—but whatever else you do or fail to do, wherever you are or however you feel, be sure that you breathe, *breathe, breathe.*

CARRIE ELLIS BRECK.

ACCORDING to the London Queen, black will be much worn this winter. The fashionable colors of the moment are pampas-green, emerald-green, bison-brown and reddish violet.

News of the Week.

HOME NEWS.

SATURDAY, November 9, 1889.

TUESDAY'S elections were pretty bad for the Republicans. The Democrats carried New York State by over 20,000, though the Republicans have the Senate by 19 to 13 and the Assembly by 68 to 60—a decreased majority in both houses. Iowa, always a Republican State, went Democratic by at least 7,000, but there too the Republicans have the legislature on joint ballot, securing a Republican U. S. Senator. Campbell has beaten Foraker in Ohio by about 12,000, and the legislature, too, is Democratic by a majority of 10, blasting the Senatorial hopes of the fiery Halstead and bringing Rice forward as a Senatorial possibility. Abbett has won the governorship of New Jersey by 12,000 majority over his Republican rival, Grubb. The Senate is Republican by one majority, but the House is strongly Democratic. The Republican plurality in Massachusetts is only 6,000. Russell, the Democratic candidate for Governor, and a "farmers' friend," made a splendid fight. Mahone has been "snowed under" by a majority of 35,000 in Virginia, but he is probably too lively a little man to stay down. Nebraska has given a solid Republican majority of 25,000. It was, of course, a Democratic "walk-over" in Mississippi. The Republicans attribute their reverses to neglect and lack of interest in their masses in an "off" year; also to failure of the government to "turn the rascals out" fast enough to make room for greedy office-seekers, and to a smaller extent to the Tanner embroglio. The Democrats say the people are getting educated, especially on the tariff question. Both parties express unbounded confidence in future triumphs..... .....
The Pan-Americans have swung round the circle back to Philadelphia. They've been having a happy and instructive time of it.. Thursday last Miss Kate Drexel, the second daughter of the late F. A. Drexel, the well-known Philadelphia banker, who left her $6,000,000, took the white veil of the novitiate at the Convent of the Sisters of Mercy, at Pittsburg, Pa. She can "go into the world" any time for the next two years, and with $6,000,000 she could easily buy an impecunious duke or even prince in Europe. .....Philip Armour, Jr. and Miss Mae Lester, daughter of a millionaire Board of Trade operator, were "mysteriously" married in Chicago, Thursday. Both families are gladly reconciled to the happy union.....When "Old Hutch" made that corner in wheat, Buffalo (N. Y.) bakers raised the price of bread and have since refused to lower it. The "boss" combine has just been broken, one of the largest operators having kicked over the traces.....The Standard Oil Trust is asking New York State for 300,000 feet of land under the East River adjoining its Long Island City property. It wants to erect on it mammoth docks for its own private use. Its business now is declared to be a nuisance to public health and a menace to adjacent property owing to danger of explosion and conflagration.....
Pension Commissioner Raum has decided that all intricate questions must hereafter be referred to him, and he has assumed personal supervision over the boards of review and re-review as well as over the medical and other divisions of the bureau. He insists that all clerks and other employees must perform their full duty. He is himself the hardest sort of a worker.....
Vice-President Morton has determined, it is said, to locate permanently in Washington, where he is investing large fractions of his fortune in real estate, although he may retain a legal residence in New York for political uses...Secretary Proctor wants an Assistant Secretary of War. The Department is one of the largest of the government, there being over 1,500 employees in Washington and over 11,000 throughout the country.....
The Cherokee Indians are getting obstinate. They say they are being bulldozed and that they will not yield an inch of the Cherokee Strip.....The Government of the Province of Quebec, Canada, has just paid over to Father Turgeon of the Society of Jesus, the $400,000 voted to the order in settlement in full of the property taken from them by the English Government "ages ago." The Protestants in the Dominion are indignantly angry and the Catholics jubilant.....An additional defalcation of between $350,000 and $400,000 on the part of ex-Treasurer Burke, has been discovered by the Louisiana authorities. The absconder is said to have sought refuge in Spain, with which country we have no extradition treaty.....
President Flagler and Treasurer Maas of the Cotton-Seed Oil Trust, acknowledge that they have lost $527,000 of the Trust funds by speculating for the Trust's benefit with its money without the knowledge of the trustees. Flagler has contributed $150,000 and Maas $100,000 out of their own pockets to meet the deficiency, leaving a loss of $277,511 for the Trust to bear. Both have resigned, and the Trust is to be changed into a corporation under the name of the American Oil Company. The new company will issue $21,000,000 common stock and $15,000,000 preferred stock to be secured by the shares of all the companies merged into the new corporation. Each share of the trust will be entitled to 50 per cent. of its face in new common stock and 25 per cent. in new preferred stock. It is estimated that the Standard Oil Trust and several other trusts may follow this example and become companies. Trusts are amenable to no State or National law; companies are.....
The New York State Supreme Court has just decided that the clause in the will of the late Samuel J. Tilden, giving about $5,000,000 for the establishment of public libraries in New York City, is void by reason of legal technicalities. Tilden was considered one of the smartest lawyers in America, yet it seems he couldn't draw or get others to draw a valid will. The case now goes to the Court of Appeals.....A disastrous fire destroyed half a million dollars' worth of property in Petersburg, Va., Thursday morning.....
The double-headed volcano of Colima, Mexico, which has a devastating record, is again in active eruption, and has done much mischief and is threatening a world more.. ....Ex-President and Mrs. Cleveland visited the White House Thursday, and had a pleasant time with President Harrison.... New York has contributed over $3,000,000 of the $5,000,000 Guarantee Fund of the World's Fair. Interest here is lagging, and not a few say the thing would be a nuisance and expense to them, though, no doubt, profitable to business men. Chicago has lost none of its vigor and is now working on New York Congressmen to support its cause. No news from St. Louis or Washington.....The Labrador fishermen bitterly complain that their business is a failure and that they themselves are destitute because American and French fishermen use trap nets and other devices for the wholesale destruction of fish, and that both nationalities treat the three-mile limit with contempt. The Canadian Government is going to "inquire about the matter." What else can it do? ....The "Cronin trial" at Chicago grows worse and worse for the prisoners. Their Clan-na-Gael friends had the supreme impudence the other day to hold a public meeting in their behalf and to issue an appeal to their "kinsmen and friends" in Ireland for moral support during the trial.....The board of trustees of the University of Pennsylvania this week adopted the co-educational system in a modified form.....
Ex-Secretary of State Thomas F. Bayard, of Delaware, was married at Washington, last Thursday, to Miss May Clymer—"one of the most interesting society events of the season."".....There was a widely circulated rumor that George W. Childs of Philadelphia, had said that Gen. Grant's body would soon be removed from New York either to West Point, the National Cemetery at Arlington opposite Washington, or to the Soldiers' Home at the latter place. Childs emphatically denies that he ever said anything of the kind, and none of the Grant family knows anything about the matter.....Mrs. "Stonewall" Jackson, who is now childless, is writing a biography of her husband.....There's talk of "bursting" the Barbed-wire Trust by repealing the $12-per-ton import duty on iron wire.....
Holders of large tracts of Florida land have just formed a big syndicate owning 6,000,000 acres. All the business connected with the improvement, sale and lease of the various tracts will be conducted under one head at Sanford.....It is reported that owing to official mismanagement there are not funds enough in the Ohio State Treasury to meet current expenditures, so that many State creditors are in distress.....
The American Bar Association composed of the best lawyers in the country, has written to the President a strong letter showing the necessity for legislation for the relief of the over-crowded condition of the docket of the Supreme Court. A case put on the docket now can't be reached for three years and the business is fast accumulating, much to the loss of litigants in the most important cases.....
A company has just been formed in London with a capital of $2,500,000, capable of unlimited expansion, for the purchase of the Chicago grain elevators. Some of the Windy City's elevators are said to have been sold already to the English syndicate that has purchased the flouring mills at Minneapolis and most of the elevators throughout the Northwest. For eight years the annual income has averaged eight per cent. and the price is reported to be made on this basis. The Pillsbury and Washburn mills at Minneapolis together with the Star elevators and 75 of the Van Dusen & Co.'s elevators have already passed into English hands. The Van Dusen elevators comprise a long line extending along the Chicago and Northwestern railway and across Dakota.....Monday the President issued a proclamation admitting North and South Dakota into the sisterhood of States. The papers for his signature were shuffled before him so that neither he nor anybody else could tell which was admitted first.... .....Two of the eight steamers heretofore running between San Francisco and Chinese ports have been withdrawn owing to a falling off in trade due to anti-Chinese American legislation.....
Governor Knapp of Alaska, complains that there is no law in the Territory providing for the transfer of land, and, except mineral lands, there is no process by which land can be acquired. It is impossible to own even a house there.....Fortunate Commodore F. A. Ramsey has for 10 years had some of the fattest and most comfortable berths in the Navy, and he has just been appointed head of the Bureau of Navigation, in Washington, the most important Bureau in the Navy Department.....
Testimony from all sections of Massachusetts is emphatic in praise of the Australian ballot system tried in the whole of the Old Bay State for the first time at last Tuesday's elections. There's little doubt that this system will be in force in all the States before many years are passed..... .....A division nine miles from Duluth, Minn., where land was worth $16 per acre, was platted some time ago and given a name like that of the most valuable division of the city. Then the swindlers sold the plots to greenhorns and over $337,000 worth of them had been recorded when the fraud was discovered last Tuesday.....
The 2,000 Indians occupying the Wind River Reservation, just south of the Yellowstone National Park in Wyoming Territory, are said to be actually dying of starvation owing to the fact that the rations issued to them are shamefully insufficient compared with those issued to other Indians.....

FOREIGN NEWS.

SATURDAY, November 9, 1889.

THE German Emperor has had a magnificent reception in Constantinople. In costly presents, street decorations, etc., etc., the visit must have cost the impecunious Sultan considerably over $1,000 000. It is believed that though no actual treaty was negotiated or formal bargain made, a very cordial understanding has been arrived at on political matters. Russians are mad that a German Emperor should visit their immemorial foe. Some say, however, that Bismarck is sacrificing Austrian interests diplomatically to Russian. Anyhow, an agreement between the Triple Alliance, England and Turkey would make a war on the part of Russia and France combined "midsummer madness." Little Montenegro appears to be Russia's only staunch friend in Southeastern Europe.....
The Boulangerists have held a well attended conference at the General's residence in the Island of Jersey, but nothing serious is likely to come of it.....
Last Wednesday, the great Paris International Exposition, after a brilliant and financially successful career of six months, came to an end. Over 400,000 persons were present at the closing fete. In spite of the opposition of all the world's royalties, it was the finest and most profitable show ever seen. It brought enormous sums of money to Paris and other parts of France. American visitors alone left there, it is estimated, about $100,000,000. Then it has greatly educated the French people. It was one of the best supports of the Republic during the recent elections. The great majority insisted that nothing should be done to imperil its success; hence the collapse of Boulangerism.....
Dr. Peters, the German African explorer, and would-be rescuer of Emin Pasha, (Dr. Schnitzer, a Silesian) has been massacred by the Massai with his band of Somali attendants. Stanley and Emin with 800 followers are pressing on towards the coast opposite Zanzibar. Emin was taken prisoner by his own 200 Egyptian soldiers who, after years of faithful service, had revolted. The Mahdists had captured his Province in Equatorial Africa, and so, after all, in spite of his enormous hardships and terrible losses, Stanley, who started out to relieve Emin, has actually done so. Another expedition is about to start inward from the coast with supplies for Stanley's men.....
Spain is to have an International World's Fair at Madrid, to open on August 3, 1892, in commemoration of Columbus's discovery.....That wide-awake young Conservative Mugwump, Lord Randolph Churchill, as usual after a Tory reverse, startles old-fogy Bourbons by urging the Conservatives to consider "reform in the land laws, the sweating system as well as laws affecting the workingmen" of England.....
.....A scheme for the federal union of the Australian colonies, modeled on that of Canada, is being vigorously pushed by Sir Henry Parkes, Premier of New South Wales.....The overflow of the Po and other rivers in Italy has caused great losses of life and property.....Rev. Dr. O'Reilly, treasurer of the Irish National League of America, has handed to the National League authorities in Ireland $40,000 collected in America.....
In the Solomon Islands an Englishman and three native boys were murdered and eaten by cannibals a few weeks ago, and an English war-ship has bombarded the coast villages in retaliation.....
Prince Alexander of Battenberg, ex-Prince of Bulgaria, was a little over a year ago engaged to be married to a grand-daughter of Queen Victoria and sister of the present Emperor of Germany. Much to the indignation of all Royalties, he jilted her and married Mlle Marie Loisinger, a well-known opera singer. The new Princess has just died in childbirth at Gratz.....The lighter-men of the London docks are again on strike to force their employers to compell their regular employees to join the Union.....
The Government of Ecuador is the last to forbid Chinese immigration.....The Argentine Republic proclaims that it will sell 15,300,000 acres of good farm and grazing land at 80 cents per acre, the proceeds to contribute to the redemption of some of the Republic's depreciated currency.....
Peru owes English bondholders $280,000,000 and $150,000,000 more will be needed to put her railroads in good condition. She has just made a settlement with the bondholders by which she virtually gives the latter for 66 years, control of her railroads and mines as well as of all of her guano deposits not owned by Chili, a concession of 4,000,000 acres of land and an annual payment of $400,000 from the customs revenue. Chili as a result of the late disastrous war, seized upon nearly all Peru's rich nitrate beds and some of her most valuable guano deposits, and she has just made the best terms possible with her creditors to get means to start national life again.....The wife of bonanza millionaire Mackay, who has of late years been toadying and hobnobbing with all the accessible princes, princelings and social notabilities of Europe is suing an English newspaper for libel, for having said she was formerly a washerwoman.....

AGRICULTURAL NEWS.

SATURDAY, November 9, 1889.

ENGLISH farmers are apprehensive that the trade in frozen mutton from the Australian colonies will seriously interfere with the profits of sheep breeders in that country by reducing prices. The trade began in 1882, and the shipments for the year ending June 30th last, reached a total of 1,200,000 head.....England also furnishes the report of a field of something over five acres in area, yielding 30 tons, 14 cwt., of potatoes per acre, or about 690 bushels. The variety was the Magnum Bonum.....The following account of the breeding and pedigree of the fastest stallion in the world, and the highest priced horse in the world, an account of whose wonderful speed, and subsequent sale were recently given in these columns, may prove interesting. Axtell was bred by Mr. C. W. Williams proprietor of Rush Park Stock Farm, Independence, Iowa. Mr. Williams was poor, but managed to buy two mares—paying for them $250. These were full sisters. They were got by "Mambrino Boy," he by Herr's Mambrino Patchen. The dam of Mambrino Boy was by Stroder's Cassius M. Clay, Jr. The second dam of Axtell was by Mambrino Royal. He bred one of these mares to William L., by George Wilkes. William L., is one of the noted stallions belonging to George Wilkes Simmons, Lexington, Ky., and is full brother to Guy Wilkes 2:15¼, and his dam was also by Dr. Herr's Mambrino Patchen. It will be seen by those familiar with pedigrees that Axtell has in his veins, first of all, Wilkes blood, the best Clay blood, Mambrino, Sir Archy, Diomed, Pilot Jr. American Eclipse, Abdallah, and several strains of Messenger blood. Axtell is so well balanced that he trots in five-ounce shoes before and four-ounce behind. He is bay in color, about 15½ hands high, and weighs about 1,000 pounds.....Dairy Commissioner Thom, of Wisconsin, has unearthed something decidedly "rotten in Denmark." At a cheese factory in Aztalan, Jefferson County, he and his assistant, H. K. Loomis, found a factory where four separators were running, and the skimmed milk was being made into cheese. About a pound of rotten butter was added to each 100 pounds of milk. The butter was evidently what had spoiled on the hands of country grocers, and had been dumped into cheese and soap boxes, fish kegs, and tubs; was streaked with green, rotten mold all through it, and emitted an odor which Mr. Thom declares was the worst he ever smelled. The butter, grease, mold, odor and all are put in a sheet-iron can and melted, and, without any effort to purify it is mixed with the milk, and the milk heated and coagulated before the stuff has a chance to rise. The commissioner says he has reason to believe that several other factories are engaged in the nefarious business, and that others are contemplating entering it. He also says that it means ruin to the dairy industry of the State.....The Russian Government has authorized certain railways to construct grain elevators, but reserves the right to appropriate them at any time it sees fit .....About 10,500,000 eggs were cooked at once in Chicago, Monday evening. The occasion was the burning of the upper floors of the Western Refrigerating Company's cold-storage warehouse.....A mechanical cotton picker is being experimented with in Mississippi. It is said to do the work of 100 negroes.... The Nebraska State Board of Agriculture, will hold its Annual meeting and also a Winter Corn Exhibit at Lincoln, beginning on January 21 next. The Armory Room in Grant. Memorial Hall has been secured, and there will be abundant space for a large display. The quantities of corn required are not large, and the premiums are liberal, so there should be a large exhibit. There will be numerous addresses and papers from able speakers. Robert W. Furnas, secretary, Brownsville..... At Bay State Fair, the co-operative creamery using the Cooley system of cream gathering and butter-making, won the first prize with the milk from mixed herds, over some of the best Jersey dairies using the separator and other processes. This was the first time that the creameries have had to compete with the fancy dairies in the same class, and therefore the co-operative factories using the Cooley system feel very much gratified at the result. There were over 200 entries of butter at this fair which is said to be the largest number of entries ever made. In the competitive contest the butter-maker who won the gold medal used cream raised in the Cooley creamer, churned it with the Davis Swing churn, and worked the butter on the Eureka butter-worker. In the contest for the best package of not less than five or more than 10 pounds, the contest was very close, between the Deerfoot dairy of choice Jersey cows using the separator process, and the West Dudley creamery using milk from mixed common cows, handled with the Cooley system. Each was scored 99 and a dozen or more experts, consumed 1½ day in deciding which was entitled to the first prize, finally deciding in favor of Deerfoot. With such odds in the matter of cows, this is a wonderful showing for the Cooley system. The milch cows entered for competition were all ruled out or withdrawn, as the managers had ruled that no prize should be awarded for milk containing less than the legal requirement of solids; that is, 13 per cent. The Green Mountain Stock Farm, West Randolph, Vt., was awarded the sweepstakes gold medal at the Paris Exposition for butter made by the Cooley process. This firm also manufactured the model working creamery for the United States exhibit at this exposition, which was awarded the gold medal. This firm has been awarded 22 gold medals during the last year, 14 of them being on the Cooley creamer and its products. This certainly is a good showing, and one of which any company may feel proud.....

Crops & Markets.

SATURDAY, November 9, 1889.

THE PRICES of wheat, oats and corn show an upward tendency, with everything very quiet. The visible supply in the United States and Canada in round numbers is: wheat, 25,000,000 bushels against 33,000,000 one year ago, and 35,000,000 two years ago; corn, 7,000,000 bushels against 10,000,000 one year ago, and 7,000,000 bushels two years ago; oats, 7,000,000 bushels against 7,000,000 bushels last year, and 6,000,000 two years ago; rye about the same as last year and barley a trifle more. This is according to the statement of the New York Produce Exchange.

BEANS show slight changes. White Kidneys are scarce and the price is well maintained. Red Kidneys are lower. Several cars of California Limas have arrived, and prices have declined. Pea beans are weak and lower.

BUTTER shows no change except that some small lots of extra, fresh table butter have exceeded quotations. Such butter is taken as fast as offered. The export demand is very light.

CHEESE shows little change in prices, although the export demand is quite strong. Skims are very dull.

EGGS advance slowly for strictly fresh, but trade is dull in everything else. Limed are very dull, and but little is doing with them.

APPLES have arrived quite freely from the West, and good fruit sells readily. The West is furnishing better fruit than New York, and better prices are obtained. Varieties most in demand are Western Kings, fancy fall varieties and Greenings.

GRAPES are in lighter receipt and prices are somewhat firmer. The Concord is the leading variety, in spite of all talk to the contrary. The majority of people buy it in preference to red, green, white or any other color. Another feature noticeable here; growers talk of packing their grapes in 10-pound baskets. What becomes of them? None are sold here. Dealers here sell nine-pound baskets.

PEARS are very quiet but prices are firm for fancy table varieties.

CRANBERRIES vary greatly in quality, also in price. There is a large quantity of defective, poor fruit on the market which sells very slowly at low prices. Fancy fruit is not plenty and sells readily at outside figures.

ORANGES from Florida are becoming more plentiful, and are of fair quality. With the decreasing supply of pears, grapes, and other domestic fruits, there is an increased demand for oranges and other tropical fruits.

LATEST WHOLESALE PRICES

CATARRH HAY FEVER CATARRHAL DEAFNESS
A NEW TREATMENT.
Sufferers are not generally aware that these diseases are contagious, or that they are due to the presence of living parasites in the lining membrane of the nose and eustachian tubes. Microscopic research, however, has proved this to be a fact, and the result of this discovery is that a simple remedy has been discovered which permanently cures the most aggravated cases of these distressing diseases by a few simple applications made (*two weeks apart*) by the patient at home. A pamphlet explaining this new treatment is sent *free* by A. H. DIXON & SON, 337 and 339 West King Street, Toronto, Canada.

Various.

A JERSEYMAN'S JOTTINGS.

COMBINATION AMONG MILK-MEN.

I HAVE been considerably interested in the description of the proposed milk trust or league of dairymen. The recent convention at Middletown, N. Y., was a very important affair, in my opinion, and I am curious to see what will come from it. Over in my country the milk business is not so important as it is in New York State. Still, we are greatly interested in this movement, because, if the milkmen can devise a scheme for securing better returns for their labor and a fairer share of the proceeds, it is reasonable to suppose that we who produce potatoes, small fruits and truck can learn the principles of the business and handle our own stuff to better advantage. I recently had occasion to discuss this matter with a man who is interested in milk dairying in New York State. He is a city farmer who has invested $60,000 in a farm up the Hudson River. This farm is run on business principles with every needed appliance, and yet the prices of milk are such that there is absolutely no interest paid on the $60,000 invested. Mind you, I am telling what was told me. Whether somebody else could make more money out of the property I do not know. One thing is sure—this man, being in the city every day, knows how the milk is sold and handled here, and has ideas of his own regarding the reasons for the present low prices and the best way of helping matters.

Now this man buys his own milk—that is, at his city home he buys milk of the man to whom the milk from his farm is shipped. This milk-dealer pays him a little over two cents per quart and charges him, at retail, eight cents per quart for exactly the same milk. In spite of this difference in price, the milk-dealers claim that they are not making much money. The tendency is to allow the farmer less rather than more. This man that I speak of, has, more than once, had his milk contracted for at a certain price for a stated term. In spite of this contract, returns would be made for less than the agreed price, the reason given being that the state of the market would not permit a higher rate. Let the dairyman object to this and the dealer says: "All right, I will not take your milk—I can get all I want—I don't need it." Then the farmer must hunt up a new market. The fact is that under the present arrangement, this milk business is about the most one-sided thing than can well be imagined. All the farmer can do is to forward his milk and take what the dealers see fit to pay him.

What makes the low price? I asked my friend this question. Here is the substance of his reply. The chief fault lies in the manner of disposing of the surplus milk. There is always a surplus—that is, more than the regular dealers require. This surplus varies from five to 12 per cent. each day; after the regular dealers are supplied, the cans left over go "on the platform" as it is called—that is, they are placed aside and sold at auction. This milk is bought mainly by speculators who get it for a very low price, and then, by underselling the regular dealers, cause dissatisfaction all around. The price that dealers pay to the farmers is determined, to a great extent, by the price obtained for this milk that goes "on the platform." It can be seen that if 10 per cent. of the milk were to sell for only 30 per cent. of the ordinary retail price, the average price of all would be reduced.

What Is The Remedy? This is another question I asked. I want to know, for it is this bothersome surplus that hurts our trade in market truck and small fruits. My friend has his remedy: whether it is sensible or not, I leave for readers of the RURAL to decide. "Let the farmers control the milk that goes on the platform!" There are 12 railroads supplying milk to New York city. Let the farmers along each railroad form an association, with a section at each point from which milk is shipped. Let the association on each railroad elect a representative to meet the representatives from the other 11 railroads and form a board of directors who shall watch the markets, regulate supply and demand and look out for the interests of milk-men generally. Let every farmer who sends milk to the city pay one cent per day for each can he sends, the fund thus accumulated to be used in buying all the milk that goes "on the platform"—this milk to be run through a butter extractor or taken at once to the tenement-house districts and sold at five or six cents per quart. By thus controlling all surplus milk, the farmers can check speculation and support the legitimate milk dealers who are needed in properly distributing milk. Most of the plans already proposed are on too large a scale. Can farmers obtain the services of men competent to carry them out? There is danger in this. Better begin in a small way and develop the business. Control the surplus first in the way indicated and then, if possible, enlarge the field of operations. JERSEYMAN.

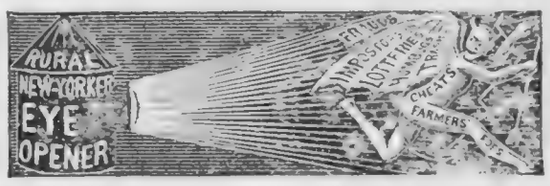
Literary.

MAGAZINE REVIEWS.

LIPPINCOTT contains the novel "A Belated Revenge," which was left unfinished by the late Dr. Robert Montgomery Bird, and has been finished by his son Frederic M. Bird. It contains considerable of the local history of the South and Southwest, which was obtained by the author during an extended trip through those localities in 1833. "Does College Training Pay?" is the title of a short article by D. R. McAnally. Some surprising statements are made in regard to college graduates. Diligent inquiries among railroad corporations, manufacturers, and all other lines of business show that the college-bred man is not only an exception to his fellows, but that not a few of the leading men in the industrial and commercial world prefer to engage young men who have grown up in the business rather than those who have enjoyed the advantages of collegiate training. One great railroad magnate stated the case thus: "College graduates have too much to forget." The author is inclined to answer his own question in the negative, and he attributes the apparent failure to the colleges themselves, which, he says, are from 25 to 250 years behind the times, being modeled after the semi-medieval universities of Europe, and which seem to be seeking to crowd more and more into their curriculums, instead of endeavoring to make their instruction more practical. No reference is made in his article to agricultural colleges. His conclusions, while not very flattering to the colleges, should be very comforting to those who have not enjoyed the advantages (?) of a collegiate course. "The Question of Pure Water for Cities," contains much of value to country dwellers. "Hand-writing and Writers" gives the peculiarities of the handwriting of many noted writers. While poor penmanship does not necessarily denote genius, many noted men have been guilty of great illegibility, not the least of whom was Horace Greeley whose bad writing is proverbial. "With the Wits" improves with age. J. B. Lippincott Co., Philadelphia.

THE PHRENOLOGICAL JOURNAL now in its 88th volume, contains much of interest for the student of the science of phrenology, while there is much to interest the general reader. Biographical sketches and portraits are given of Prof. Elias Loomis, for many years professor of natural philosophy and astronomy at Yale, and whose death occurred last August; of Austin Corbin, president of the Long Island and Philadelphia and Reading Railroads; and of Ella Dietz Clymer, president of Sorosis. Braunfels Castle, or the Castle on the Brownrock, in Germany, is illustrated and described. "Doings of Women Folks" describes several exchanges which have been established in New York by women for the benefit of their sex. A very interesting article on "Mental Cultivation" contains much valuable information. "Consumption in the Sleeping Car," sounds a note of warning about the dangers attendant upon this luxury of travel. Fowler & Wells Co., New York.

THE HOME-MAKER for November is hardly up to its usual standard. The editor, Marion Harland, sees a hopeful sign in the disposition of the inhabitants of the Southern States to engage more and more with each succeeding year in the celebration of the great Yankee festival, Thanksgiving, while, on the other hand, the observance of Christmas is becoming more general in New England, where it was formerly little noticed. Estelle Thomson contributes another article in the "Wonderland" series, "The Date-Palm and its Fruits." It is evident that she has not the material at hand which she has had for her former articles, as the Date-palm is not so common in California as the other fruits of which she has written so entertainingly. These trees are being planted to some extent in the southern part of the State. There are two or three good Thanksgiving stories. "A New Industry" tells how a young wife who hadn't a spark of genius for anyting but cooking, turned that accomplishment to a most useful and helpful purpose in time of sorest need. "A Tombola Party" describes a new, and we should judge, a very interesting game for home entertainments. "Light Infantry" is a dissertation on babies by Frank Chaffee who claims to be a bachelor. He says that bachelors do love babies if they only have a chance, but he admits that there are some kinds of babies that they don't love, and they are not to blame for it. "A Plea for the Mother-in-law" is entered by Helen Marshall North. The Home-Maker Company, New York.



CALIFORNIA'S COLLAPSED LAND BOOMS.—Nearly two years ago, the Eye-Opener on several occasions, issued emphatic notes of warning against investments in the boomed town-sites in Southern California, and gave numerous instances of the fraudulent nature of many of the "booms." It is to be hoped that the warnings had a deterrent effect on intending investors in such enterprises. According to the latest advices, there isn't a single boomed place which hasn't inflicted a loss on permanent investors: the only people who have made money by any of the undertakings are those who sold out during the period of inflation and pocketed dishonest profits. Most of the boomed sites have collapsed, while a few are still trying to allure the unwary. The most accomplished real estate manipulator can no longer keep up inflation prices, and with humble unanimity all those that still retain any vitality, have just prayed the State Board of Equalization for a great reduction of taxes. The figures represented are interesting to Eastern men who have backed up the booms with their coin, and now hold deeds to remote sand lots graced with a profuse growth of cactus burrs. The figures for Los Angeles County afford a good example of those for some others. State Comptroller Dunn says that he knows personally of one piece of property which, in 1887, sold for $15,885, and which has since been returned to the owner for $6,000—the face of the mortgage upon it. At Oak Knoll, lots that readily sold two years ago at $500 cannot now be sold for $100. An official list of boomed town-sites in Los Angeles shows sales amounting to $403,980 and the assessment on the same property is only $90,590, while the owners insist on a reduction of at least 20 per cent. in the rate. Sixty paper towns were projected in all parts of the county, two at least of which were in the desert; but even lots in these were unloaded on the ususpecting Eastern public. The 60 town-sites comprised 79,350 town lots as listed by the assessors and at present the whole 60 have only 2,351 inhabitants. Among the towns were Borden City, having 1,920 lots platted, and not a single inhabitant; Chicago Park, 2,286 lots, and one single inhabitant, the watchman who takes care of the leading hotel; Carlton, 4,060 lots, and no inhabitants; Manchester, 2,304 lots, with not a soul in it: West Glendale, 8,128 lots, and no inhabitants; Sunset, 2,032 lots, and one inhabitant, he being, as in the other case, watchman of an expensive hotel. The mass of these town-sites are not merely tracts of land with a stubble of surveyor's stakes. Many of them are laid out in streets, some with avenues leading to nowhere, cement side-walks, on which jack-rabbits scamper up and down, and an occasional electric light standard which affords a resting place for owls, and here and there perhaps the skeleton of a half-finished house.

INFANTILE Skin & Scalp DISEASES cured by CUTICURA Remedies.

FOR CLEANSING, PURIFYING, AND BEAUTIFYING the skin of children and infants and curing torturing, disfiguring, itching, scaly and pimply diseases of the skin, scalp and blood, with loss of hair, from infancy to old age, the CUTICURA REMEDIES are infallible.

Send for "How to Cure Skin Diseases."

Baby's Skin and Scalp preserved and beautified by CUTICURA SOAP.

KIDNEY PAINS, Backache and weakness cured by CUTICURA ANTI-PAIN PLASTER, an instantaneous pain-subduing plaster. 25c.

MASON & HAMLIN

The Cabinet Organ was introduced in its present form by Mason & Hamlin in 1861. Other makers followed in the manufacture of these instruments, but the Mason & Hamlin Organs have always maintained their supremacy as the best in the world.

Mason & Hamlin offer, as demonstration of the unequalled excellence of their organs, the fact that at all of the great World's Exhibitions, since and including that of Paris, 1867, in competition with best makers, of all countries, they have invariably taken the highest honors. Illustrated catalogues free.

ORGANS $22 to $900

Mason & Hamlin do not hesitate to make the extraordinary claim for their Pianos, that they are superior to all others. They recognize the high excellence achieved by other leading makers in the art of piano building, but still claim superiority. This they attribute solely to the remarkable improvement introduced by them in the year 1882, and now known as the "MASON & HAMLIN PIANO STRINGER," by the use of which is secured the greatest possible purity and refinement of tone, together with greatly increased capacity GRAND & UPRIGHT, for standing in tune and other important advantages.

PIANOS

A circular, containing testimonials from three hundred purchasers, musicians, and tuners, sent, together with descriptive catalogue, to any applicant.

Pianos and Organs sold for cash or easy payments; also rented.

MASON & HAMLIN ORGAN AND PIANO CO.
BOSTON. NEW YORK. CHICAGO.

BY ONE MAN. Write for descriptive catalogue containing testimonials from hundreds of people who have sawed from 4 to 9 cords daily. 25,000 now successfully used. Agency can be had where there is a vacancy. A NEW INVENTION for filing saws sent free with each machine, by the use of this tool everybody can file their own saws now and do it better than the greatest expert can without it. Adapted to all cross-cut saws. Every one who owns a saw should have one. Ask your dealers or write FOLDING SAWING MACHINE CO., 503 to 511 South Canal Street, Chicago, Ill.

Animal Meal for Poultry Food.

Cheapest and Best Animal Feed on the market. Good suostitute for beef scraps (*which are high and scarce*). Send for Circulars for more particulars. I will send you a Poultry Book of 31 pages free.

EMPIRE AGRICULTURAL WORKS
LATEST IMPROVED MACHINES in the MARKET.

It pays to get our Illustrated Catalogue and Price on Tread and Sweep Power, Thresher, Separator, Corn Sheller, Feed Cutter with Crusher, Land Roller, Engines, three to ten Horse Power.
G. S. MESSINGER & SON, Tatamy, Northampton Co., Pa.

CATALOGUES, ETC., RECEIVED.

MASON & HAMLIN ORGANS AND PIANOS.—Everybody knows the Mason and Hamlin organs. These instruments excel in the quality of their tone. In addition to this, they are always well made and handsomely finished. They will *last*. They are built for business and for business of the finest character. Send for a catalogue to the Mason & Hamlin Organ Co., Boston, Mass.

BELLE CITY CUTTER.—Catalogue from the Belle City Manufacturing Company, Racine, Wisconsin. The feed and ensilage cutters made by this firm are of all sizes from the small hand machine to the large ensilage cutter capable of chopping up 24,000 pounds per hour. These cutters are in use by hundreds of farmers, and the manufacturers can show some of the strongest possible testimonials from practical men who look at the matter from a business standpoint entirely. A new feature of the Belle City cutters is the new self-feeding chain attachment which is considered a great labor-saving device. This firm also sells horse powers, saw mills, root cutters, feed carts, cultivators, harrows, hay forks, etc. Send for this excellent catalogue.

T. V. MUNSON, DENISON, TEXAS.—A catalogue of fruit trees, grapes and ornamental trees and shrubs adapted to the Southern climate. The promising Parker Earle Strawberry is now offered for the first.

CLOVER CUTTER. Circular from P. A. Webster, Cazenovia, N. Y. This is a very handy little machine for preparing clover and grass for poultry. It chops the clover into short bits, leaving it in just the right condition for the hens. The R. N.-Y. has one of these cutters and is much pleased with it. Poultrymen will do well to investigate this matter. Send for circulars.

AGRICULTURAL REPORT.—The first report of the Secretary of Agriculture is a brief, pointed, comprehensive document, bristling with facts, and prolific in suggestions and recommendations. Secretary Rusk evidently believes that he holds his office for the benefit of the agriculturists of the country, and he appeals earnestly and confidently for such support as will enable him to acquit himself creditably in the position assigned him, and to see that the work confided to him is efficiently performed.

The Secretary makes the usual references to the work of the several scientific and other divisions in his Department, and in addition he deals at length with certain plans for the thorough re-organization of the Department of Agriculture and suggests several new features in the interest of the development of agriculture. The first efforts toward a re-organization were hampered because of the surprising fact that the appropriations for the current fiscal year were made entirely upon the basis of the old organization, no account being taken of the entire change in the status of the Department. A striking contrast is drawn between this amount and the appropriations for agriculture made by those countries which the report says "are the most active competitors of American farmers in the world's market." A comparison shows that Great Britain appropriates for agriculture $1,500,000, Germany $2,850,000, Brazil $20,000,000 for agriculture and mines, France $8,000,000 for agriculture alone, and Austria more than $4,000,000.

It is his desire to organize the Department upon even a broader plan than these and other countries have established.

The Secretary pays a high compliment to Assistant Secretary Willetts. The problem which presented itself to the Secretary of getting the results of the work done by the Department more promptly before the people, has been solved by the establishment of a new division, which furnishes promptly to the agricultural and commercial press a synopsis of the main points of every bulletin and report published by the Department. Citing the circulation of the papers which have received and utilized the synopses furnished by the Department, the Secretary regards the plan as virtually covering the entire field, "for," he adds, "the farmer who does not read some paper devoted to his calling is beyond the reach of intelligent effort on his behalf."

The results of the labors of the Division of Entomology have been of great importance. Several parasitic enemies of the Scale insect so destructive among the orange-groves of California have been successfully introduced. Special investigations have also been made of the leaf-mite of the orange in Florida, the horn-fly, an imported pest of cattle in the middle Atlantic States, the grain aphis in the Central States, and blights, fungi, etc., in different localities. The Secretary says that interest in silk culture still remains unabated, and he is very hopeful of the future of the industry. Of the crop-reporting system, the Secretary says, "* * * While approximate and valuable, it is in danger of becoming discredited by the popular acceptance of its results as exact in precision and absolute in authority. It should be remembered that they are not the conclusions of a thorough census, though they may be far better than the work of a poor census; that they are the consolidations of local estimates of agricultural experts, and are intended as a foil to the interested, biased and untrutbful statements that speculators issue to mislead their victims." Of the rapid development of agriculture in the Rocky Mountain districts, the Secretary says that the Division of Statistics has been directed to investigate their resources with all the facilities at its command. "The results," he adds, "will surprise the Eastern States with views of wealth and progress of the Great American Desert of the recent past."

The region where the sorghum-sugar industry may be attended with success has been localized in the southern part of central Kansas, west and south of Wichita, and in parts of the Indian Territory resembling it in soil and climate. There are perhaps other parts of the United States where similar success could be secured, but these have not been pointed out. Special attention is to be given to the development of varieties of sorghum containing a higher content of available sugar. Important progress has already been made in this direction. Many localities in the United States, especially in the north and on the Pacific coast, are known to be specially suitable for the production of a sugar beet rich in saccharine matter. The interest in this subject developed by the successful experiments in California will be met by the publication during the coming winter of a full report on the beet-sugar industry in the United States.

The Botanical Department is to be specially occupied in an effort to solve the problem of increasing the forage yield on the 200,000,000 acres of the arid region outside of possible irrigation by promoting the productiveness of the grasses now growing there. To aid in this work, and in procuring a productive grass for the Southern States, the Department proposes to undertake experimental work specially devoted to this subject. In regard to textile fibers, the question now occupying the attention of the Department is the utilization of flax, jute, ramie and other fibers, all of which can be cultivated in certain sections of this country by means of improvements in machinery, such as will do away with the excessive manual labor incident to its preparation for manufacture. A special investigation into this field of labor in Europe is now being made by a capable man commissioned by the Secretary for that purpose.

In treating of the office of experiment stations and their work, the Secretary emphasizes the necessity of remembering "that quality more than magnitude decides the value of every enterprise, and that this one can attain its highest success only in proportion as the laws which underlie the practice of agriculture are discovered and made available to the practical toilers of the farm." The report urges the duty of the government to assume a more definite supervision of such forest areas as are still owned by it and as occupy a position of importance in the regulation of water flow and of other climatic conditions, and emphasizes the importance of the relations which the forests bear to the problem of irrigation in the arid lands and on their immense annual product. The Secretary recommends the setting apart of some 300 acres of the Arlington estate for the use of the Department for the testing of new varieties of fruits and other important experimental work at present impossible owing to lack of room.

The Secretary announces some changes in the manner of purchasing seeds, and his determination closely to observe the products of other countries in order that the seeds of such as are found to possess singular excellence may be secured and experimented with in this country. The employment of a competent expert is also contemplated, one who can efficiently perform the inspection and nomenclature of cereals. A supply of five varieties of Mediterranean wheat and also of Bermuda Grass seed has been ordered from Europe, the latter being specially designed for the Southern States.

The library is reported to be very deficient, both in material and arrangement. The museum is being rapidly extended. The importance of having a standard for the naming of new varieties is enforced. A gratifying report is given of the excellence of American agricultural products at the Paris Exposition.

The subject of agricultural organizations is dwelt upon earnestly, their astonishing growth during the past few years being cited as strong evidence of the growth of the spirit of self-help among the farmers. The farmers' institutes are referred to particularly as one of the greatest movements in the history of agriculture, and as the strongest lever for raising and upholding the work of superior agricultural education represented by our system of agricultural colleges and experiment stations. The Secretary recommends, without going into details, that the Department should be empowered to afford aid and encouragement to this work.

In referring to the work of the Bureau of Animal Industry, pleuro-pneumonia naturally is first noticed, the situation being regarded as most encouraging. This disease is now said to be effectually under control and restricted to Kings and Queens Counties in New York State, to New Jersey, and a limited section in each of the States of Pennsylvania and Maryland. A careful review of the field, together with the arrangements made for the supervision of the limited districts still infected, justify, in the Secretary's opinion, "the most sanguine hopes" in regard to the proximate complete eradication of the disease. Texas fever, says the report, is generally spread through the channels of interstate commerce, and therefore can only be effectually controlled by the Federal government, hence the necessity of legislation which shall be ample and clearly defined.

The language used by the Secretary in regard to a national meat inspection law is pointed and vigorous. The necessity for inspection at the time of slaughter is, first, to enable the authorities promptly to locate any cattle disease centers, and, secondly, to avoid the anomaly of leaving the inspection of our own meat products to the officials of other countries, thus giving foreign governments some show of reason for the claim that they have better opportunities for learning of disease among American cattle than are enjoyed by our own government. He accordingly advocates "such an amendment to the law under which the bureau is at present organized as will provide for such official national inspection as shall guarantee the fitness of our meat products for food consumption under the seal of the United States government." Authority and means are also desired to enable the Department to exercise a close supervision of the economic side of the cattle markets, the characteristics of stock commanding the highest price, variations as to age, weight and quality, and all facts bearing upon the cattle industry which will enable the bureau to supply to farmers such information as it is impossible for them to obtain for themselves.

The dairy interest comes in for an earnest share of attention, and the intention is announced to establish a special division in the Bureau of Animal Industry devoted exclusively to the service of this great interest.

Poultry is made the subject of a special paragraph, and the Secretary declares it to be his intention that it shall receive more attention.

The sheep industry secures special consideration in the report. The growth of the mutton interest is referred to as one greatly to be encouraged. As to wool-growing, the reduction of the tariff in 1883 is earnestly deplored. To it is attributed the great reduction in the number of sheep, which has since then fallen off by about 7,000,000 head, while the importation of wool has increased from 78,850,651 pounds in 1884 to 126,487,729 pounds the past year. "On behalf of this industry," says the Secretary, "I recommend these facts to you, and should they be submitted to Congress I ask for them intelligent and careful consideration."

In conclusion the report submits figures showing the importance of agriculture, which produces an annual yield of nearly $4,000,000,000, employing on the 5,000,000 farms 10,000,000 persons, representing a population of 30,000,000 people, while the value of live stock alone is estimated at $2,507,000,000. That agriculture underlies all other industries, it alone making our vast commerce possible and rendering the product of our mines valuable, assigns to it the first place in considering the well-being and prosperity of the country.

HERE is a man who is the benefactor of his race, or wants to be. A German musician has discovered that many persons who study music practice too much. Funny that no musician ever found that out before. Other people have known it ever so long.—*Fort Worth Gazette.*

THE YOUTH'S COMPANION

Announcements 1890

A National Family Paper—Two Millions of Readers.

The full Announcement of Authors and Articles will be sent on application.

Six Serial Stories,

Fully illustrated, and among the most attractive ever published.

150 Short Stories—Thrilling Adventures—Sketches of Travel—Health and Hygiene—Biographical Sketches—1,000 Short Articles—Popular Science—Natural History—Outdoor Sports—Anecdotes—Etiquette—Wit and Humor—Poetry.

Illustrated Supplements

Were given with nearly every issue during the last year, and will be continued. They give an increase of nearly one-half in the matter and illustrations, **without any increase in the price of the paper.**

Eminent Contributors.

Articles of great value and interest will be given in the volume for 1890 by

Rt. Hon. W. E. Gladstone, General Lord Wolseley, Sir Morell Mackenzie, Eugene Schuyler,
Hon. James G. Blaine, Senator Geo. F. Hoar, Prof. John Tyndall, C. A. Stephens,
Justin McCarthy, M. P., Hon. John G. Carlisle, Hon. Samuel S. Cox, Lt. Fred. Schwatka,

And One Hundred other well-known and favorite writers.

Four Holiday Numbers

Are in preparation, and will be exceedingly attractive, filled with the special work of our favorite writers, and **profusely illustrated.**

Thanksgiving—Christmas—New Year's—Easter.

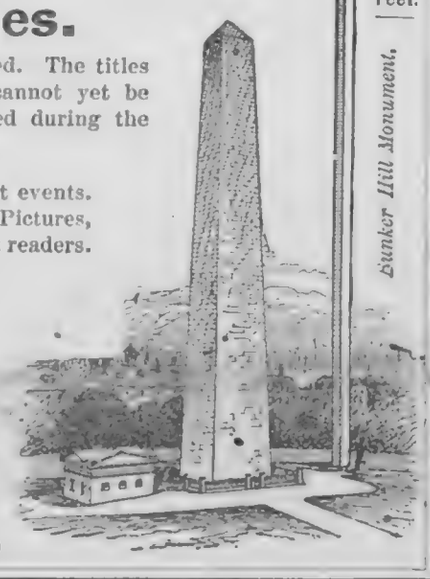
These Four Souvenir Numbers will be sent to each subscriber.

Household Articles will be published frequently, giving useful information on Art Work, Fancy Work, Embroidery, the Decoration of Rooms, Cooking, and Hints on Housekeeping.

$5,000 Prize Stories.

Nearly Six Thousand Stories have been examined. The titles and authors of those which will receive the Prizes cannot yet be announced, but the successful Stories will be published during the coming year.

The Editorials give comprehensive views of current events.
The Children's Page contains charming Stories, Pictures, Anecdotes, Rhymes and Puzzles, adapted to the youngest readers.



Free to Jan., 1890.

New Subscribers who send $1.75 now will receive the paper free to January 1st, 1890, and for a full year from that date.

Sample copies free. Please mention this paper. Address,

THE YOUTH'S COMPANION, Boston, Mass.

(Send Check, Money-order, or Registered Letter, at our risk.)

792 Feet. This column represents one week's edition of The Youth's Companion; 432,000 copies. 221 Feet. Bunker Hill Monument.

PHÉNOL SODIQUE

relieves pain instantly, healing the wounded parts. **Farmers and Stock-raisers** find it a prompt remedy for all kinds of Hurts, Galls, diseases of animals like Ulcers, Eruptions, Crack, Thrush, Itch, Mange, Cattle-Typhus, Foot-Rot, and Foot and Mouth Diseases, Scratches. For sale by Druggists and Merchandise Dealers. Price 50 cts. For circulars etc., send to Proprietors, HANCE BROS. & WHITE, Philad'a.

HORSES

FOR ALL PURPOSES AT LAKESIDE.

Standard Bred Trotters.
A rare lot of Young Stallions of most popular lines of breeding.

French Coach Horses.
Imported and American Bred, of very superior quality, style and action.

Clydesdales.
A Superb Lot of Young Stallions, Mares and Fillies of this valuable draft breed, the result of years of intelligent and careful importing and breeding.

Percherons.
A few unusually fine young Stallions of this deservedly popular breed.

Catalogue containing full descriptions and pedigrees mailed to parties interested. In writing mention this paper.

SMITHS, POWELL & LAMB,
SYRACUSE N. Y.

Sold by Hardware Dealers Generally.

THE R. N.-Y.'S HYBRIDS BETWEEN THE BLACKBERRY AND RASPBERRY.

ANOTHER of the R. N.-Y.'s blackberry-raspberry hybrids fruited during the past season—and another chance occurs to record a failure. The illustration, Fig. 278, is a photograph of a fruiting stem, and shows, therefore, the berries true to nature. The plant is strong and vigorous, with characteristics both of the raspberry and blackberry. It resembles the blackberry, however, in most respects, though distinctly *not* a blackberry. The illustration shows a fair average of the fruit—there was not a perfect berry on the plant. It is an interesting fact that though the drupelets were those of the blackberry, the flavor of the raspberry was pronounced. We have a dozen of these hybrids which have not yet fruited, but those which have fruited give little or no promise that anything of value will ever come from the hybridism beyond the interesting fact itself.

Rural Topics.

RATS! RATS!!

"WEEDS OF THE BUILDINGS."

HOW TO KILL THE PESTS.

DOGS, CATS, POISONS, TRAPS.

"How do you proceed to kill rats and mice about your farm buildings? In what way do they cause the greatest damage? Are they increasing in numbers?

FROM FRED GRUNDY.

I HAVE fought rats and mice for years, and am still hard at it. This season they seem to be more numerous and destructive than ever. They are everywhere—in the stables, poultry-houses, pig-pen, garden and open field. The first thing they seriously damaged this season was my strawberries. Of these they ruined over a bushel by nibbling the seeds off just as the berries were ripening, giving them a dirty, rusty appearance and rendering them unfit for any purpose. They also bit gallons of them off the stems while green. A neighbor who grows quite a large lot of strawberries lost several bushels in this way. I placed several spring and Delusion traps, baited with fried meat, in my patch and caught a large number of the little pests, most of them being the regular house mice. Both rats and mice began on the sweet corn as soon as it was out of the milk, climbing up the stalks at night and tearing open the ends of the husks and eating down the ears. One man told me a few days ago that he had shot several large rats gnawing away at the ears in the day-time. As soon as the field corn was out of the milk they began on that in the same way. They cleaned up most of an acre of very fine corn for a man who lives near a creek in the suburbs of the village before he suspected their presence. They are especially destructive in shocked corn, sometimes devouring all but a few ears on the outside. They burrow holes in the ground 12 or 14 inches deep, and eight to 12 feet laterally, piling the dirt up two or more feet high inside the shock. We have neither rats nor mice in the house. When it was built the carpenters were cautioned to be especially careful to leave no openings through which the pests might enter. I have a vegetable cellar outside with a double board roof packed with cut straw, and they got into that and proceeded to clean it out in style. I spoiled their fun, however, by burning sulphur on an oil stove placed inside and closing the doors tightly. The fumes penetrated every crack and crevice and made it so unpleasant that they left in disgust.

In the stables the mouse crop is kept within reasonable bounds by several cats that abide there; but they don't seem to trouble the rats. For catching these I use an old-fashioned sliding-door trap baited with sweet corn, apples, sweet potato, etc., and they never get very numerous. I once used Rough on Rats for poisoning a large colony of mice that had settled in the cow stable, and when they came out of their holes to expire they were picked up and swallowed by my fine Plymouth Rocks. The effect of such highly seasoned diet was extremely disastrous to the fowls, and I bought some more. I have used strychnine on crushed sweet corn with emphatic results, and I consider it superior to any other poison for destroying rats and mice in the field. My main reliance about the buildings, however, is on cats and traps. In constructing farm buildings great care should be exercised to avoid making rat harbors and mouse dens.

Christian County, Ill.

FROM PROFESSOR A. J. COOK.

I use traps in the house and cats in the barn. This is for mice. I have trapped rats quite successfully. Some years ago the pests were quite annoying about our house and barn. The red squirrels came to live with us. They got into the house walls and garrets. We rather enjoyed seeing them and so encouraged their sojourn in the house. The only objection to their presence was that their early waking and gambols sometimes disturbed company and they sometimes found and appropriated the children's nuts that were stored in the chambers. On the whole, we liked their company. After the squirrels came the rats all left, and we have not seen a rat for years either at the house or the barn. I have no doubt that the squirrels drove the rats away. If this would work successfully every time, then it might pay to introduce and encourage the presence of red squirrels about the house and barn. Three or four squirrels about the barn do no harm. So far as I have tried them I can recommend red squirrels as the best of rat-traps.

Ingham County, Mich.

FROM T. B. TERRY.

Our old house was overrun with rats and mice. They did about as they had a mind to up-stairs and down cellar. They had been "holding the fort" for many years, and they kept on in spite of us. When I built a new house, six years ago, I determined to occupy it alone. The cellar was built of hollow bricks, with a thick cement floor, and screens were put over all windows. The wood-shed and all are mouse-tight. Two or three times a mouse has been carried in with the wood, when throwing it into the wood-shed; but as there is nothing there for mice to eat they can be caught in a trap as soon as it is known that any are there. These hollow bricks are glazed, so that a mouse or rat cannot climb up the underpinning and hold on while gnawing through the wood-work; neither can it by any possibility get through the wall.

It is not so easy to keep these pests out of the barn. My granary in the barn-basement is rat-proof, however. It, also, is built of hollow bricks, with a tile and cement floor, and the sills above are bedded in cement on top of the hollow brick walls. Then the floor above is made of two-inch, matched Norway pine. We tried hard to keep the new barn, built some years ago, shut up until I could get the old one with its numerous inhabitants torn down and cleaned up; but enough of the rascals got in for a start. Since then I have kept two or three barn cats, and I haven't for a long while seen a rat or mouse, although for a time the vermin were very numerous. When the cats were first put in, the rats kept in the straw above and seemed to think they were all safe; but after a time they wanted a change of diet, or some water, and as they could not go down into the basement with safety they actually gnawed three holes through the siding of the barn to get out and I don't think they ever came back. When the doors are shut at night they cannot get into the barn any more than they can get into the house, and possibly we could get along now without the cats, as there is nothing whatever that they could harbor in around the barn. Those that escaped probably spread the news in the neighborhood that water was scarce in our straw loft.

I believe I have tried, in years past, about every way of catching rats that was before the public; but usually I had to admit that the Lord didn't make me as smart as our old rats. I thought I had them once when I read that if a rat was caught and singed and let go again, he and all of his race would leave the premises. My man caught an old fellow, and removed his hair over a burning newspaper and returned him to his friends in our old wood-shed. He staid by us, saucier than ever, till he died of old age. When we were so fortunate as to catch any more, we singed them clear through. I might state, to show how

THE R. N.-Y. HYBRIDS BETWEEN THE BLACKBERRY AND RASPBERRY.
FROM A PHOTOGRAPH. FIG. 278.

thoroughly we have conquered these pests, that this year, wanting the granary to store early potatoes in, I put up a car-load of wheat in bags and piled them up in our covered manure shed, where they stood for weeks entirely uninjured. This alone was worth more to us than the cost of keeping the cats for years. Rats and mice never did us any very great injury; but in some way or other it always seemed that when they were running, we hadn't quite got that "dominion" of which Prof. Roberts spoke so grandly in a late number of the R. N.-Y. They are rather small game; but nevertheless I have enjoyed getting the upper hand of them.

Hudson, Ohio.

FROM A. L. CROSBY.

I suppose these may be called the weeds of the buildings, and are as useful in their way as the weeds of the field, that is, they help us to realize that we live in a vale of tears. If we could only farm without weeds

The only remedies I know of for rats and mice are cats, dogs, poisons and traps. Poisons I never use; cats and dogs I always keep a supply of, and when the rats get very numerous I set traps, but after catching a dozen or so, no more will enter the traps for a long time. But I have noticed that there seemed to be a smaller number about than the proportion caught would account for, and I am under the impression that they emigrate to some neighbor, and my belief is helped by the fact that sometimes there seems to be a sudden large increase in the number of rats about the buildings, I suppose because one of my neighbors has been warring with them, and they have left him in a body.

I read once of an easy plan to get rid of rats; it was to catch one alive, paint him red and then turn him loose; it was said he would drive all the rest away. I set a trap and after weeks of waiting, caught one, and painted him red and let him go, "his native freedom to enjoy." That night he went back into the trap. I am convinced that there is no easy way of getting rid of these rodents.

If I thrash my grain soon after harvest and husk the corn before winter, rats do not do me much damage as I can keep them out of the granary and corn house, but the mice are hard to get even with, as they can live on so little and do so much damage at the same time. They cannot be scared like rats; catching them in traps doesn't seem to make much impression on their number, and though the cats and dogs kill a great many, yet there always have been plenty of mice and I am afraid always will be.

The damage mice do is in "littles," but it counts up in the course of a year. Gnawing holes in grain bags and bins, cutting the bands of grain sheaves, fouling the grain, cutting holes in shingle roofs, destroying samples of choice seeds that have been "carefully" put away, committing suicide in pails of cream and in various other ways reminding us that they are doing their work faithfully and thoroughly while we occasionally jam a corn-cob in a mouse hole, and wonder what mice were made for anyhow.

Catonsville, Md.

FROM H. A. MARCH.

"Rats in the granary, rats in the barn, rats in the chicken-houses; rats all over the farm." There is no pest that can equal the long-tailed rodent for malicious meanness here on Puget Sound—no not even the heathen Chinee, for the Chinaman takes only what he can make use of, while I have had rats gnaw into my brooders and kill 50 fine broilers of a night and they did not eat half of one. I carry on an extensive chicken ranch in connection with cauliflower-seed raising. I raise from 1,000 to 1,500 chickens each year, and keep from 500 to 800 laying hens in 15 houses, and, of course, use large quantities of grain and ground feed, the odor of which, with that of the poultry, brings the rats from the woods and from all the neighbors' places to mine, especially in a cold snap in the winter or a very dry time when feed is short in the pastures, for the pests will feed on clover and get fat like so many woodchucks. Then we are fairly overrun with them. They become so bold that they will carry off young chickens in the day-time and attack the hens in the coops. But the worst trouble they cause me is by getting into my underdrains. We have no tile here for draining, so have to use cedar bolts, which are laid on rails and answer a very good purpose, as they are very lasting, (some that have been down over 30 years are still doing good work). Now the rats will enter the drains where they empty on the beach, travel up a distance, gnaw through the planking, and dig out to the surface, of course, filling the drain with earth and necessitating the opening of it sometimes in a dozen places in 100 yards. Trapping does no good. Ten men with a dozen traps each would hardly make a showing; it would amount to about as much as trapping rabbits in Australia. "Rough on Rats" the pests won't touch. I have baited them for three or four days with meal, and then put Rough on Rats in the dish, and it would stand until it was decayed, and not a rat would touch it.

Strychnine is the only thing that will fetch the pests every time. and this is the way I use it:

I take four quarts of wheat, put it into a kettle kept for that purpose and into no other; cover it about an inch with water, set it on a fire to heat. Now take half of a bottle of strychnia or one-sixteenth of an ounce, put it in a cup with a couple of spoonfuls of vinegar which will dissolve it, now mix it with the wheat and water and bring it to a boil (stay with it, you can't be too careful), every little while stir it up as the wheat swells and softens; keep on stirring until the water is all absorbed by the wheat, then it's ready for business; after taking it off the fire while it is yet moist, take a large handful of brown sugar and stir it into the mass. This removes the bitter taste of the strychnia and gives it a gingerbread odor that will fetch them from long distances. To feed the wheat and make it safe, take a box about the size of a soap box; saw out a hole about the size of a rat hole on each end and the sides; now under the box set a quart pan with the poisoned wheat in it; lay a flat stone on the box and the thing is done. I put the boxes under the barn, pig-sty or chicken house; in fact, in any place where they will be safe from children, pigs and chickens. And now, brother farmers, if you are going to poison rats let me tell you, *do it yourself.* Don't trust it to the hired man, or to the boys; but go right at it yourself, and be sure you put the poison where you know that it will be safe from "little hands" and all domestic animals.

Fidalgo, Washington.

FROM GEORGE DORMIRE.

Rats do not trouble my house, I guarded against them when I built it. I also intended that the house should be mouse-proof, but in this I failed. Mice are giving us a little trouble in the dwelling-house and in the barn and other outbuildings they are having full sway and are quite troublesome. The best way to prevent the ravages of mice and young rats is to keep their numbers reduced as much as possible by means of self-setting traps and good cats. A good cat is the best trap in existence. She is the natural enemy of mice and their certain destroyer, and it is much cheaper for me to feed a few cats than it is to feed the mice, to say nothing of the annoyance from them. But with grown rats the case is different. It is seldom that a cat will attack a full-grown rat, and it seems that the flesh of rats is not wholesome food for cats. My experience has taught me that any continued and persistent warfare against the pests is the best means of getting rid of them, or of keeping their numbers reduced, and the best mode of fighting them is by the use of a good rat-terrier and a gun or revolver. Rats are extremely averse to be made targets of in shooting, but that is risky business about a barn. I do not think that the pests are more numerous or troublesome than they used to be. They are quite numerous and troublesome at times, and then again there will be but a few. In grain crops they damage our corn mostly by shelling it and eating the hearts out of the kernels, and unless we have a tight floor in our cribs the corn so shelled is likely to go to waste. They are also damaging the foundation walls under the barns and outbuildings by burrowing under them, thus causing them to fall down or otherwise weakening them.

Carysville, Ohio.

FROM R. BRODIE.

Living, as we do, a few minutes' walk from the city, we are troubled more by rats than farmers who live farther in the country. In winter they take refuge in the hot manure that is carted into the fields from the city, and in summer I have even cut them with the mowing machine in cutting hay. In my barn my grain and feed bins are lined with sheet-iron, but it is harder to keep them from burrowing under the foundation of the root cellar. I have filled their holes with broken glass, but they make other holes alongside. If building again, I would get the footing stone laid in cement and part of the floor also. Mice are much more easily trapped than rats, the latter being much more cunning. I have tried poisoning with a phosphorus preparation; but I would rather stand the living mice and rats than the smell of dead ones in the house. In the barn, however, it did fairly well till they looked on it with suspicion and fought shy of it.

The best way to fight them is to have a good cat or two and a couple of good dogs. I have a terrier and a Collie dog, both good ratters; but the cats are the best for the house as they will not chew up the woodwork as the dogs do. Unfortunately the neighbor's dog killed my pussies; since then the mice have been increasing. Our girl caught 11 in a trap yesterday. The dogs are the best for keeping down the rats about the barn and on the farm. They will hunt them out from under the stable and barn floors and not give them a chance to make nests. No farmer should be without a Collie to care for the cattle and a Scotch terrier or a fox terrier to guard against rats and mice. Where the rats caused me most damage was in a root cellar under our barn. The pests found their way under the floor into the cellar; the holes they made let in the frost which did a world of injury in addition to the amount of stuff the nuisances destroyed, and the dogs could not find their way through the closed doors into the cellar. I intend building a root cellar away from the other buildings. I have not seen a rat about my buildings this season, but I come across an occasional dead one in the fields and orchards, that the dogs have killed. When I was young my father used to give us a penny a rat for all we were able to trap. It was great sport.

St. Henry of Montreal, Canada.

FROM C. C. WARREN.

We are not troubled with mice or rats about the house as we keep two cats, but we have only the small woods rats to contend with. Those big imported fellows that sit up on end, waving their tails like banners in the air and which can put an ordinary cat to flight, have not yet made their advent here and I am not anxious for any of their company about the barn and corn-crib. I sometimes use poison to keep down those small rats, but am not troubled much by them. About the only damage they do is to eat a little corn.

Grand Bay, Ala.

The Vineyard.

CALIFORNIA WILD GRAPE-VINES.

THE Vitis Californica, which is being used for a resistant stock on which to graft many varieties, is one of the most picturesque and beautiful objects on the California river bottoms and in the ravines. Very few writers have spoken of it, and very few tourists ever get a glimpse of the grape in its native haunts, because it is seldom seen in the cultivated valleys or near the high ways of travel. It grows on the Lagunitas, the Alameda, the Sonoma, and the Sacramento, along the Salinas, San Joaquin and Russian Rivers. It is at its best in central and northern California. One of the most beautiful examples of wild-grape arbors in the State is to be seen along the Rio Linda and Chico Creek, on Gen. Bidwell's farm in Butte County. Here, for 15 miles the trees on the banks are covered with grape-vines, in vast domes, spires, arches, arbors and columns. The illustration seen at Figure 280, shows but two out of thousands of forms which these magnificent vines have taken in their superb luxuriance of growth. They creep up banks and cover piles of stone and ledges of rock. They cross from tree to tree, in leafy bridges. When in bloom they scent the air for miles. In autumn so abundant are the small, purple clusters that they seem to color the whole forest. After the leaves and fruit have fallen, the vines are still worth admiring study, for they reveal their labyrinthian intricacies and are the delight of artists and photographers even more than during their leafy luxuriance in summer. The vines seem to have little choice about the trees they clamber over. The sycamores and alders, white oaks and maples are all loaded with wild-grapes that in a few years climb to the tops, and trail back in a thousand graceful and flowing curves. In the Vaca Valley some of these large vines have been grafted to Muscats and Black Moroccos, with entire success. C. H. S.

Niles, Cal,

SOME FINE OLD GRAPES.

I SEND by express to the R. N.-Y. a basket of grapes, of the older varieties, Catawba, Concord, Diana and Iona, that the Editor may judge of their quality as compared with that of some of the newer kinds, and of the same as grown at the Rural Grounds. They are some that were grown by me on the south shore of Lake Erie, not a great way from Cleveland, Ohio. The weather has been such that they were allowed to hang on the vines until October 24th. Thousands of acres have been planted with vines along the shore of the lake, generally from one to two miles from the water, and vine-growing has become a great industry employing a great many people. The Concord is taking the lead of everything else on account of its productiveness, hardiness and cheapness, and I sometimes think on account of its quality, as people want it more and more.

I wish that I could send to the R. N.-Y. some Delawares; but they are gone for the season. They were the "fairest of the fair;" and when perfect have hardly been equaled for fine flavor. Miner's (the true Victoria) made fine bunches this year the same as Concord. I have put in a small bunch of dried Brighton that the Editor may see how much sugar there is in them—something like a raisin. H. B. SPENCER.

Cuyahoga County, Ohio.

R. N.-Y. The above grapes, though not so large as they often are seen in market, were of the finest quality. It is certainly true that Concord is all the while making friends. At this time the price of Concords and Catawbas in the New York market is the same.

Dairy Husbandry.

THE EFFICIENCY OF SEPARATORS

An interesting study: results of experiments with various hand and power cream separators; varying results with the Lefeldt and De Laval power separators; conditions that affect the results; results from the De Laval hand separator and the "Baby Separator;" power needed to operate them.

THERE have recently appeared in German papers the results of experiments with regard to Lefeldt and De Laval milk separators to determine under what condition the greatest efficiency of creaming can be obtained. As these results are of equal value in our country, I wish to give a liberal translation of the work of Dr. J. Klein and M. Kühn, O. Nuebert and H. Wilhelm, as epitomized in "Biedermann's Central Blatt für Agrikulturchemie." Only general results are given.

Klein and Kühn have experimented upon Lefeldt's small separator with milk at different temperatures, with greater or less influx, and with different sized pistons for regulating the flow of the skimmed milk. From many results they conclude that the efficiency of creaming is, within certain limits, greater as the temperature of the milk rises. An efficiency of 94 per cent. was obtained between 82 and 93 degrees (F.); and one of 93.16 per cent. at 70 degrees and of 87 per cent. at 55 degrees. The efficiency of creaming sank as the quantity of milk used in a given time was increased even if the relation of cream to skimmed milk remained the same as with the smaller quantity. This same relation was retained by enlarging the opening for skimmed milk and substituting larger pistons. While an efficiency of 94 degrees was obtained by the influx of 587 to 627 pounds per hour, it sank by the use of 1,100 pounds to 87.52 per cent.

If the quantity of milk used remained the same, the relation of cream to skimmed milk exerted less influence. When the relation was one part of cream to four parts of skimmed milk a creaming efficiency of 95.16 per cent. was obtained. When it was one part of cream to 10 of skimmed milk the efficiency sank to 94.12 per cent. only.

Naturally with the higher efficiency lower fat contents of the skimmed milk were obtained. With the highest efficiency the skimmed milk contained .20 per cent. of fat and with an efficiency of about 90 per cent. it contained .30—.40 per cent. of fat. From the above it appears that the best results were obtained with the relation of one part of cream to five parts of skimmed milk. Klein and Kühn conclude that Lefeldt's Separator, running at 6,000 revolutions per minute, with milk above 77 degrees, and a ratio of cream to skimmed milk as one to five and using 620—640 pounds of milk per hour, reaches an efficiency of 94 per cent.

They found that with the DeLaval Steam Separator under normal conditions with 7,000 revolutions a minute and a milk temperature above 77 degrees, and a relation of cream to skimmed milk as one to five and an influx of about 680 pounds of milk per hour, a creaming efficiency of 95 per cent. was obtained.

The test of the DeLaval Horizontal Hand Separator showed that with the same relation of cream to skimmed milk, using 330 pounds of milk per hour with a temperature above 77 degrees, an efficiency above 92 per cent. was obtained if the crank was turned 40 times a minute. If it was turned faster, the relative amount of skimmed milk became greater; if it was turned slower, the relative amount of cream increased. Both must be avoided as much as possible by turning regularly.

For the purpose of obtaining a regular supply of milk, the authors recommend the use of a large storing can for the milk, from which it flows into the can placed upon the separator. A strong man was barely able to keep the separator in uniform motion for half an hour, although an essentially easier motion should be obtained from a newly built machine. Finally the authors have experimented with the smallest of DeLaval's centrifugal machines, the Baby Separator, and obtained with it by using 125 pounds of milk per hour at a temperature above 77 degrees, a creaming efficiency of 91.2 per cent., and they claim that a maid-servant of medium strength can keep the Baby Separator a whole hour and even longer in regular motion.

O. Neubert has experimented with the Hand Separator and Baby Separator. With the Hand Separator by using an hourly quantity of 330 pounds of milk at a temperature of 86 degrees, he obtained a creaming efficiency of 87–93 per cent; by using 220 pounds of milk per hour, he obtained an efficiency of 91.8–92.8 per cent. Where the milk influx was regulated better by the swimmer of the apparatus, the creaming efficiency for 400 pounds of milk per hour was 89.9 per cent.; with 375 pounds of milk, it was 90 per cent. and with 300 pounds, 89 per cent. at which reduced quantity the cream flow sometimes stopped. The fat contents of the skimmed milk varied between .28 and .40 per cent., according as the machine did its best or poorest work.

During the first trial of the machine the necessary exertion was seemingly great, so that a strong man was scarcely able to turn more than an hour. However, after an improvement in the axle-beds and after carefully oiling, the machine ran much more easily so that a strong man could turn it for between one and two hours without noticeable fatigue or breaking down. With the Baby Separator, using 220 pounds of milk an hour, a creaming efficiency of about 90 degrees was obtained and the exertion was about the same as that necessary for the improved hand separator.

H. Wilhelm reports upon the Baby Separator. He praises its work under normal conditions; but states that the machine is heated by running a whole hour, and recommends that it be stopped every half hour and oiled anew to prevent wearing out. The author states that the Baby Separator can be turned at least 15 or 20 minutes by a boy or girl He obtained a creaming efficiency of 89.9 per cent. by using 130 pounds of milk per hour at a temperature of 86 degrees having a relation of cream to skimmed milk of one to five.

It will be noticed that the statement of Neubert in regard to the ease with which the hand separator can be run differs materially from that of Klein and Kühn. I have seen the hand separator in frequent operation and it was always run by two strong men where the machine was used for about two hours a day. Personally I should consider the statement of Klein and Kühn as very nearly correct, and I believe that Neubert must have used an unusually easy-running machine.

Hanover, N. H. CHARLES L. PARSONS.

THE CORNELL UNIVERSITY AGRICULTURAL ASSOCIATION.

Object, membership and plan of work of the association; Canadian cheese-making discussed; farms and farmers on both sides of the line; five stages of cheese-making: coagulation, heating, dipping, cutting and pressing the curd; differences between the processes employed in Canada and in New York.

AT Cornell University there is an organization known as the Cornell University Agricultural Association. It is an association formed for the purpose of discussing the leading topics and principles of the agriculture of the day. The students seek by this intercourse and close association to benefit themselves by widening their knowledge of the science of agriculture. The active members are the agricultural student body. Besides these, there are several honorary members, consisting of the Agricultural Faculty—Profs. Roberts, Caldwell, Law, Bailey, Prentiss, Comstock and Dudley—and also Prof. Robertson of the Ontario Agricultural College and Prof. Wickens of the Imperial University of Austria. The Association meets every Tuesday evening, in their quarters at the agricultural reading-room, when a debate is held, or some one presents a paper. In either case the subject is open to discussion. These meetings are considered by the students to be of the greatest benefit to them. The meeting of Tuesday, October 29th, was of especial interest, as the subject treated of one of the products of New York's greatest industries, the dairy. The speaker was Prof. H. H. Wing, Deputy Director of the Agricultural Experiment Station at Cornell University. The following is a report.

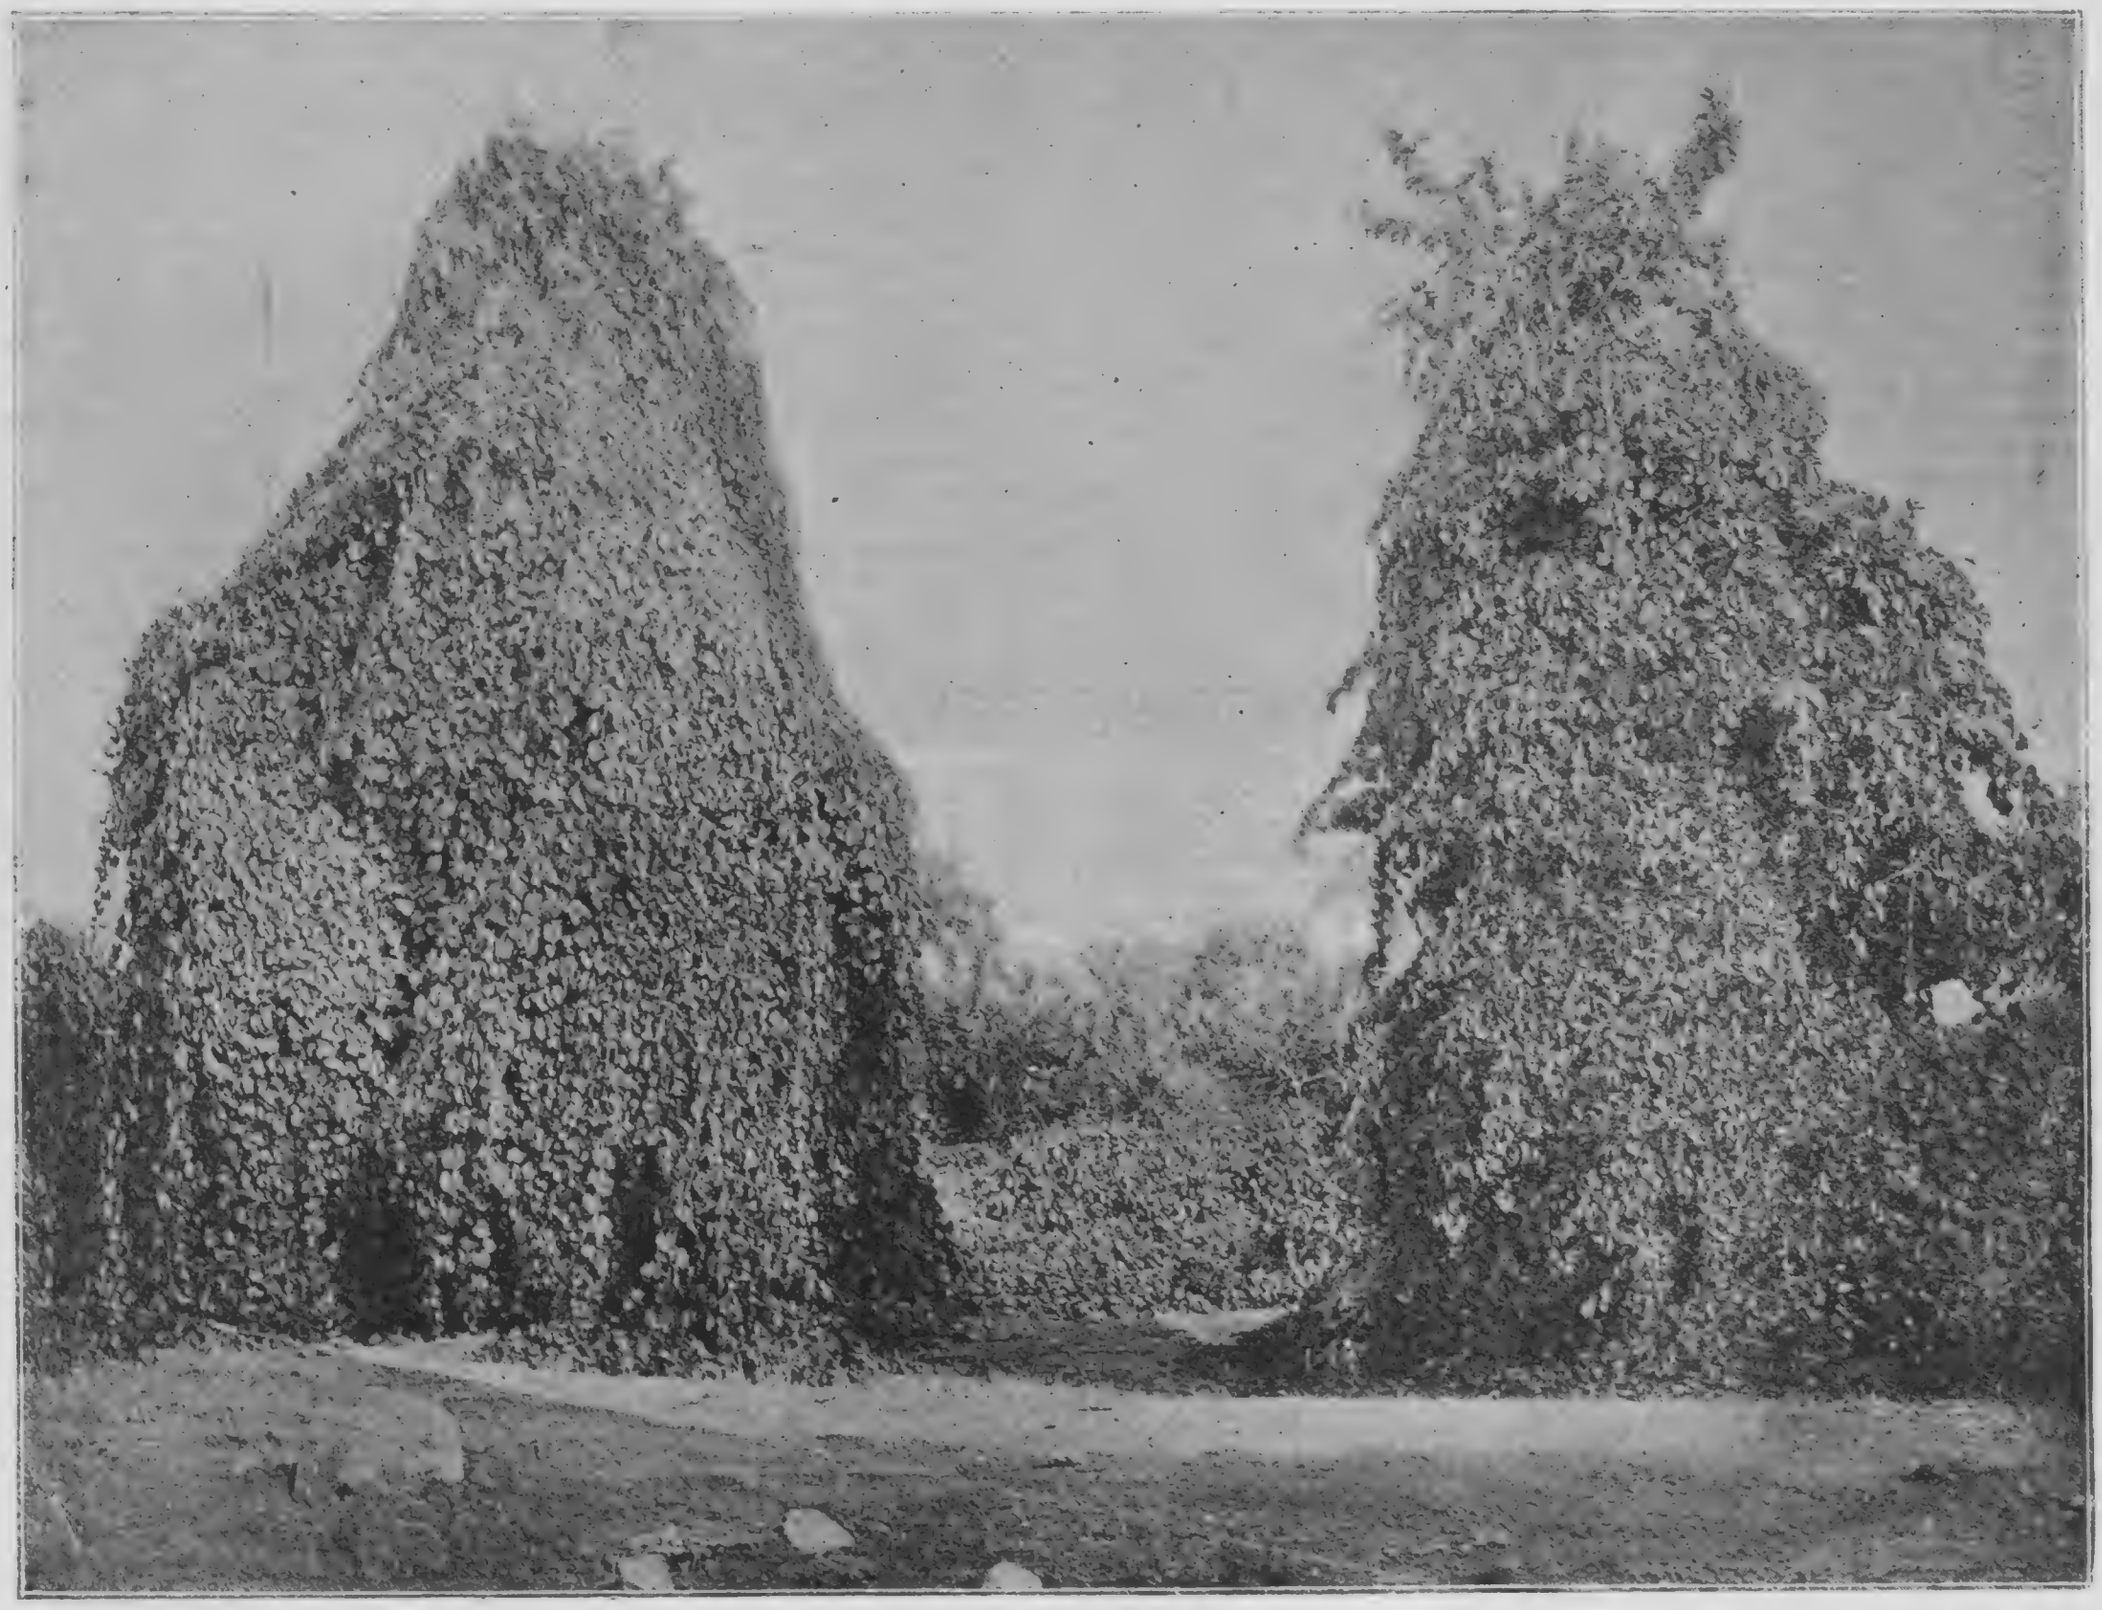
Prof. Wing announced as his immediate subject, Canadian cheese. During the past summer he spent some time in Ontario, studying in general its agriculture, and in particular cheese-making. Preliminary to his general discussion, he first gave a brief outline of the condition of Canadian farms and farmers. The soil and climate of Ontario are similar to those of New York State with the exceptions that the land appers to be less fertile, and the growing season about one month shorter. This latter fact prevents the successful growing of corn. In place of this crop, large quantities of turnips and peas are raised. The prices of crops and the financial condition of the farmers seem to be about the same as here. The factory at which Prof. Wing was, is located at Bluevale, and is under the charge of T. J. Dillan, one of Canada's most expert cheese-makers. The factory is a large one, having a capacity of about 36,000 pounds of milk or 45 cheeses per day. The milk is delivered only once a day. It is usually all in by nine A. M. and then the process begins. The entire process may be divided into five distinct periods.

1. Coagulation—from the reception of the milk till the curd is ready to cut.
2. Heating the curd.
3. Dipping the curd.
4. Cutting the curd.
5. Pressing.

STAGE 1. As the milk is being turned into the vats, the steam is gradually applied until the milk reaches a temperature of 84–86 degrees. Ordinarily it is ready to set (applying the rennet) as soon as the vat is full. But it is not always so. A proper degree of ripeness should be reached before the rennet is added. This time may be determined by an arbitrary test. There are many tests; in fact, nearly every maker has his own. The regular test, however, depends upon the time it will take for a certain quantity of rennet to effect coagulation in a certain amount of milk. This test varies, however, because of the different strengths of rennet extracts, and the various sizes of the vessels used. The test given, however, was as follows: When one tea-spoonful of rennet will effect coagulation in a tea-cupful of milk in ten seconds the milk is ready to set. Rennet is usually added at about the rate of 3½ ounces per 1,000 pounds of milk, but the amount varies somewhat with the weather and the condition of the milk. The rennet is first added to a pail of water and this is then added to the milk. This causes an equal distribution of the rennet. The milk is next stirred for a few minutes and then left. In 30 to 40 minutes the curd will be ready to cut. This completes the first stage.

STAGE 2. The curd is cut in small cubes a little over one-half inch through and then stirred with the object of separating as quickly as is possible the whey from the curd. Heat is gradually applied until a temperature of 98 degrees is reached. During this operation the cubes have become smaller and smaller, and more leathery in appearance. The process of heating and stirring requires very careful work to prevent the breaking or bruising of the curd and consequent loss. In a short time acid develops, and the curd is ready to dip. The test in this case is, when curd applied to a hot iron will "hair out" one-fourth of an inch it is ready to dip.

STAGE 3.—The whey is run off quickly, and the curd is dipped into the sink. Here the processes employed in Canada and New



CALIFORNIA WILD GRAPE. FROM A PHOTOGRAPH. FIG. 280

York differ somewhat. The Canadian maker tries to keep the curd well stirred up to give it as much air as possible and at the same time to keep it warm. The New York maker allows it to become more compact. The curd is now cut into large chunks and piled up, when it has the appearance of India-rubber. The time during which it remains in this condition varies with the condition of the milk and the weather. The proper time when the curd is ready to cut in the mill is determined by another test. The hot iron is used, and when the curd will "hair out" one inch it is ready.

STAGE 4.—The curd is cut in small strips, and then stirred for 10 to 15 minutes. The appearance is now changed, the curd taking on a soft, silky feeling. The color also begins to develop. Fat can be squeezed out, and as soon as the curd is salted it will be ready to go to the press. Salt is used at the rate of about 2¾ pounds per 1,000 pounds of milk.

STAGE 5.—The curd is then put in the hoops and pressure is applied, at first gently and finally with full power. The processes followed in Canada and New York differ in some points. New York makers dip the curd and after stirring it awhile put it in the press. Time is not given for so full a development of acid and color as in Canada.

E. T.

TWINS.—A well-fed cow, and a well-filled pocket-book; a general-purpose cow, and a no-purpose owner; a fat-as-a-seal heifer calf, and, later on, "dairyin' don't pay;" a cow to the acre, and a farm of rich acres; a trained—not "broken"—cow, and an undented milk bucket; a warm cow stable, and saved feed; a dairy thermometer, and no inquiry as to why the butter doesn't come; a gentle owner, and an intelligent cow.—A. L. CROSBY.

Everywhere.

RURAL SPECIAL REPORTS.

Illinois.

FRANKLIN GROVE, Lee County, October 28.—The clover crop in this State is far better than any we have had for five years, and we have had good weather to husk it. Corn is a fair crop though not of very good quality. Oats are of good quality. The yield was about 40 bushels per acre. H. H.

Indiana.

ROCKVILLE, Parke County, October 29.—Spring, summer and autumn have been delightful and productive. Cereals, fruits and flowers have been in great abundance, and the promise of our coming crops is very good. The great pest has been the grub-worm, and the only birds I have ever seen devour it—the crows, blackbirds and English sparrows—all the boys have written and printed permission to slay—and even premiums are offered for their scalps.

BATES.

Kansas.

MEADE, Meade County, November 4.—We are having the second snow storm of the season. This is the earliest winter the oldest settlers have seen. Corn was mostly good. It sells at 15 to 20 cents per bushel. Wheat was poor on account of dry weather in the spring. A large acreage of both wheat and rye has been put in this fall. Plentiful rains have put both in good shape for the winter. All kinds of feed are very cheap. Stock of all kinds are low.

N. R. B.

Missouri.

BELTON, Cass County, November 9.—This has been a year of general prosperity in this county. We have had a bountiful supply of everything except money which is very scarce. Corn will go from 30 to 60 bushels per acre, and it is selling at 18 and 20 cents per bushel. Most of the farmers are feeding their corn to cattle and hogs. Oats were nearly a failure. We had a heavy fog at blooming time and rust struck them. Price 12 to 15 cents per bushel. Wheat was very good—yield 20 to 40 bushels; but the acreage was small. I never saw a better prospect for winter wheat than we have now, and the acreage is large. Flax was not very good, there being too much wet weather in the spring which is very injurious to that grain: yield from three to 12 bushels per acre, the price ranging from $1. and over. Potatoes were about half a crop—50 to 100 bushels per acre. The shortage was due to too much wet weather in the spring, which kept people from working them, letting the weeds get the start, checking them and thereby reducing the yield. Price 30 to 40 cents; no rot here. There is about as much money in potatoes as in anything we plant. Hay was an extra good crop, but owing to so much wet weather it was put up in very bad shape. Price low: we can hardly dispose of it. Clover seed is a very light crop; on account of so much wet, it did not fill out—yield one-half to three bushels per acre; price $3.75 per bushel: a good many did not hull their crops. Navy beans were good, but the weather was almost too wet for them to set. I raised from one pint two bushels of very fine ones. Our cash products here are corn, wheat, clover seed, hay, cattle and hogs. Vegetables of all kinds were good, so were berries. Blackberries were an immense crop and sold for 40 to 50 cents per gallon.

C. A. D.

Wisconsin.

BRILLION, Calumet County, November 7.—Farmers are practically through thrashing, and the yields of grain have been above the average. Thrashing in this section, though farms are small, (40 to 160 acres, 80 is the general size) is done entirely by steam. Traction engines are used, which are not only self-propelling, but they draw the separator and water tank as well, thrashing 800 to 1,500 bushels is an ordinary day's work. The best report I have seen from this county was 900 bushels of barley thrashed in five hours, and 1,650 bushels of mixed grains in a day—the product of 32 acres. Prices are low: wheat 70 cents; barley, 30 to 50 cents; oats, 15 cents; bran, $8 per ton. There was no rain here from September 10 to November 1. October was a remarkably pleasant month—only five cloudy days. The fields have been so dry that plowing on clay lands has been impossible. On November 1st we had a light rain not sufficient to moisten the ground more than two or three inches. To-day is quite cold and a slight crust has frozen on the ground. Quite a large area of winter grain has been sown. Early-sown (1st to 10th of September) looks well; that sown later is small.

E. G. F.

THE FARMER'S CLUB

ANSWERS TO CORRESPONDENTS.

[Every query must be accompanied by the name and address of the writer to insure attention. Before asking a question, please see if it is not answered in our advertising columns. Ask only a few questions at one time. Put questions on a separate piece of paper.]

RINGBONE: DISLOCATION OF KNEE-CAP IN A COLT.

W. G. S., Benedict, N. Y.—1. My four-year-old colt I began to work this fall. He is a very fast walker. There is a small enlargement on the pastern of one hind leg. The animal shows no lameness yet, but when he steps out while drawing hard, one step is shorter than the other, the longest being made by the affected foot. I fear it may become a ringbone. What can be done to prevent this? 2. A two-year-old colt when led out of the stable this morning, stretched out and one hind leg became stiff as if affected by the cramp and it could not move ahead until I took hold of the foot and lifted it up and forward, and it catches again in a few steps and then it is all right. Is this a stifle-joint difficulty, and will it be likely to be permanent?

ANSWERED BY DR. F. L. KILBORNE.

1. The longer step is not due to the enlargement. In fact, it rather indicates some trouble on the opposite limb with the shorter step. If there is no farther growth or lameness, try the application of the compound tincture of iodine to the enlargement daily until the skin is blistered. Then omit for a few days, and repeat if necessary. If, however, the enlargement continues to grow or causes lameness—*i. e.* if it becomes a ringbone—the best treatment is to have it thoroughly fired by a competent veterinary surgeon. If either the dam or sire of the mare has ringbone it would be well to fire at once, because the earlier a ringbone is fired the better the chances of a recovery. It is not usually advisable to breed from a mare with ringbone, and especially if the ringbone has appeared in two or more successive generations. If a ringbone develops as the result of a severe injury it is not so liable to be transmitted, and a desirable mare with such a ringbone will often raise sound colts. A stallion with ringbone, except for special reasons, should always be rejected for breeding purposes. 2. The trouble was dislocation of the knee-cap at the stifle joint. When dislocated as above, you can feel the rounded bone at the other side of the joint, where it has been allowed to slip owing to a relaxed condition of the muscles. In raising and bringing the limb forward (which you very properly did) it is also well to press on the knee-cap from the outside to assist in throwing it into position. To prevent a recurrence of the accident, clip the hair and apply an active blister over the whole region of the joint. (Powdered cantharides one half ounce, vaseline two ounces, spirits of camphor 20 drops). Rub the blister well in for 10 or 15 minutes. Tie the head short to a high rack to prevent the colt reaching the blister with her mouth. After 24 hours carefully wash off the remaining blister with Castile soap-suds, and apply vaseline daily until healed.

MULCHING AN ORCHARD.

J. H. T., Chapman, Kan.—As mulching young fruit trees is recommended, is it good policy to continue it 10 years or more on upland ground having a black soil two feet deep, and a yellow clay sub-soil? The object would be not so much to manure the ground as to keep up a thrifty growth, by keeping the ground moist, in our many dry summers, and keeping the weeds down without expensive hand labor.

ANSWERED BY PROF. J. L. BUDD.

West of Lake Michigan to the Rockies, I have reason to believe the best mulching for young orchard trees is good cultivation. In all cases coming under my observation the mulching for four or five years in succession tends to bring the surface-feeding roots to the top, when a sudden cessation of the practice always results in severe injury—if not total loss—of the trees by root freezing. A friend now living in Nebraska lost a fine young orchard by neglecting the mulching after it had been continued for seven years. In this case even the Duchess and the crabs were root-killed, showing conclusively that the mulching favored a shallow habit of rooting. And yet I believe in any system of shading the soil during the heated term. We cannot do this by covering the whole surface after the spring cultivation, with marsh hay, as is done by some pear growers in New Jersey; but we can do it by the annual sowing of Japan Buckwheat about the first of July. As many are prejudiced against this crop, I would request a careful trial of it in the orchard by sowing half of the land three years in succession with buckwheat, and managing the other half in the usual way. I think all will find—as I have done—that the half shaded with buckwheat will in three years show larger, cleaner, and healthier trees than the other half, and its first crop of fruit will be more abundant, more uniform in size, and excellent in shape and color. I said Japan Buckwheat as since its extended trial, I find it a more certain crop than our old sorts, and it answers the purpose of keeping the soil moist and cool quite as well.

THE WHITE GRUB.

V. D. S., Lewistown, Pa.—What is the history of the white grub that has been destroying a large amount of potatoes in this neighborhood? In nearly all cases the damage was done where a sod had been turned down. How can we protect the next crop from the pest? Would dressing the sod with lime be a preventive?

ANSWERED BY PROF. A. J. COOK.

This insect is the larva of the common large May Beetle—Lachnosterna fusca. Each beetle lays scores of eggs in meadows, strawberry beds or other permanent herbage. These eggs hatch into the white grubs that live three years, eating the roots of grasses, strawberry plants, and if forced to it, roots of corn, wheat and even the tubers of potatoes. I presume those that have troubled V. D. S. by eating his potatoes were in the third year, as he says they were large. He says they troubled potatoes on sod ground; this is their habit. It is probable that they will not trouble the potatoes next year on the same ground, unless perchance there be others in the land in the second year of their development, which is not likely. A little examination will tell. It would do no good to scatter lime on the sod before plowing, as the lime is not harmful to the insects. There is always danger of plowing sod for such crops. The only safe way is to examine the land carefully in the fall. If the grubs are found in force, plow early in the fall, then drag often in the fall and spring. We thus give the birds a chance to free the soil from the pests. I have known blackbirds to rid acres of meadow of myriads of these grubs in a few days in late summer. It is also well sometimes to turn hogs into badly infested meadows. We thus turn the grass into pork indirectly through the sleek, full-fed grubs. In case lawns are injured it is best to spade them up and re-sod or seed. In case of strawberries frequent changes of bed—never planting on sod or old strawberry ground—is the safe and easy cure This change pays in any case.

SITE FOR A PEACH ORCHARD.

A. S. B., Waynesboro, Pa.— I have a nice, smooth piece of land, lying well up along the mountain, with north and west slopes covered with chestnut, pine and oak timber. I want to remove the timber; some of it has been taken off already. I want to plant the ground with peach trees. The soil is a mountain gravel of a flinty sort. Are the location and soil suitable for peaches? Would it be advisable to plant the peach trees soon after the land is cleared?

ANS.—The elevation and the north and west slope are favorable and so is the character of the soil and the fact that it favors the growth of chestnut trees, which are nice in their requirements. They can, however, endure a drier air than peach trees like, and quite as much seems to depend on calm, mild, humid air, such as we generally have in June and September, as on a dry, healthful soil. An exposure facing east is favorable because it affords shelter from the parching effects of wintry northwesters. If some of the timber is allowed to remain, especially some pine, to add to this shelter and to dampen the air somewhat by its exhalations, so much the better. The surest judgment as to the fitness of any locality for any special kind of fruit is obtained from observation of the growth and yield under like circumstances in the same region. The trees can be planted as soon as the ground is cleared, but should not be interfered with by weeds or sprouts any more than any other cultivated crop. If there are many decaying roots in the ground they may develop an acid injurious to the growing roots and a good dressing of ashes or lime or both would be advantageous in any case. A wide mulch of pine brush around each newly planted peach tree has been found very favorable to their growth and repellent to the borer beetle.

VALUE OF ASHES FROM A CORD OF WOOD.

A. S. B., Waynesboro, Penn.—What is the value of the ashes from a cord of hard wood; also the value of the same from a cord of light wood? What weight of ashes ought to be yielded by a cord of wood? I have a lot of wood for which I have no near market; it could be cut and piled in one place cheaply; I want to know what the ashes, per cord of wood, will be worth to me as a fertilizer. State the probable quantity per cord, and its approximate value on the farm where it is to be used as a fertilizer. Will it be worth more if covered with earth and burnt to charcoal?

ANS.—A cord of hard wood will make about 70 pounds of ashes, worth probably 60 or 65 cents. The soft-wood ashes may contain about the same amount of potash, but a smaller amount of phosphoric acid than the hard wood, so their value would be determined by the requirements of the crop to which they were to be applied. We should think the ashes would hardly pay for the labor unless the latter were *very* cheap. On general principles, the R. N.-Y. is opposed to the practice of burning up wood for the sake of the ashes alone. Dr. Hoskins, as our readers know, uses large quantities of wood in burning bones. He believes this to be the best way, all things considered, to "reduce" the bones to a suitable condition to be used as a fertilizer.

INDIGESTION IN YOUNG PIGS.

R. H. S., Rhinebeck, N. Y.—What ails my nine-months-old pigs? First, two were attacked—one laid out flat on its side, and the other got on its front knees with its nose pressed hard on the floor, while it stood up behind. The second laid down flat also, and inside of 12 hours both were dead. Another has since died and two others are similarly affected. When the last ones were attacked they would go round and round in a circle if hurried. The last three attacked are now all right, being in good, healthy condition. Those that died were troubled with twitching and spasmod

ic jerkings of the stomach. On opening the carcasses I could find nothing strange except that some parts of the entrails were bloody. Their feed was pumpkins and corn, boiled, with ground oats and rye put in a trough dry and fed with the boiled feed. All acted in the same way in pressing the nose against the ground.

ANS.—The trouble was probably due to indigestion or over-feeding. Medicinal treatment of pigs of the above age is usually very unsatisfactory, and in fact should rarely be necessary where the pigs are properly fed—not over-fed soon after weaning—and kept in suitable quarters. See notes on the care and feeding of young pigs in recent numbers of the RURAL.

SMALL FRUITS, ETC.

S. F. S., York, Pa.—I wish to plant for our local market, small fruits and vegetables, which I will retail myself. What varieties of strawberries, raspberries, blackberries should I procure? What will the plants cost per 1,000? Where can they be bought? What are two-year-old asparagus roots worth per 1,000 and where can they be bought? Where can I buy the Rural New-Yorker No. 2 Potato? How much per bushel?

ANS.—Strawberries: Sharpless, Bubach, Charles Downing (if it succeeds in your locality), Pearl, Parker Earle. Raspberries: Cuthbert, Marlboro, Hilborn (black). Blackberries: Kittatinny, Minnewaski. The strawberries will cost about $2.50 per 1,000: the raspberries about $8.00; blackberries about $8.00 The Minnewaski will cost more. Two-year-old asparagus roots will cost about $7.00 per thousand. All seedsmen sell them. The R. N.-Y. No. 2 will be offered by all seedsmen. You should be careful to secure the *true* No. 2, as other kinds have been offered for it.

STIFLE LAMENESS.

S. N. L., Chatham, N. Y.—My horse was stifled about three months ago. Although he is able to go about with careful usage yet he is very lame when I attempt to trot him. He refuses to back as it seems to hurt him. What can I do for him? I would prefer not to blister him.

ANS.—The most satisfactory result could probably be attained by either blistering or firing; but the application of a strong liniment or tincture of iodine two or three times a week, with a long period of rest, say, at least three or four months, might effect a cure. If possible keep the horse on a warm dirt floor (preferably in a box-stall where the animal can have more exercise, otherwise he should be walked out daily,) where there will be little difficulty in getting down and up without danger of slipping. A light, laxative diet should be given while the horse is idle.

A STEAM GENERATOR FOR HEATING WATER.

W. B. H., Boise City, Idaho.—In fixing up a laundry and bath rooms, I desire, if it is practicable and economical, to put in a steam generator such as the "Purinton" for heating water in wash and bath tubs and boiling clothes in stationary tubs. Will the steam passing through short pipes into a tub containing water and clothes, boil the clothes thoroughly? Is the use of a steamer more economical of fuel and labor than heating water and boiling the clothes on a stove?

ANS.—The R. N.-Y. has not seen this generator used for the purpose named, but it is informed by creditable correspondents that such use is convenient and economical. We have no doubt about the economy of using such a generator in the laundry and bath-room.

Miscellaneous.

J. L., Sand Point, Idaho.—Wm. MacNaughton's Sons of this city buy furs of all sorts. They can doubtless tell you where you can sell buck horns.

W. M. P., Eldorado Springs, Mo.—Does the World Manufacturing Company, 122 Nassau Street, New York, still have the New American Roller Organs for sale, and are they reliable?

ANS.—Yes; yes.

E. W. A., Buckingham County, Va.—A neighbor proposes to work my five-year-old Concord vineyard on shares. He is to do all the cultivating with horse and hoe as well as all the pruning and manuring. What should be his share?

ANS.—Nothing is said about picking, trimming and packing and marketing the fruit. If the neighbor does all these, an equal division of the profits would be about equitable.

C. P., Parnassus, Pa.—My riding horse has had the scratches badly. Just now there is no sore or inflammation. I keep the animal clean and use sweet oil when desirable. If I neglect to do this even for a day, a hard horny substance forms, something like the frog of the foot. 1. Is the trouble grease-heel? 2. What can we do to cure it?

ANS.—1. Yes. 2. Try the course of treatment advised in the F. C., of November 9th 1889, for Scratches or Grease-Heel.

C. F. B., West Groton, N. Y.—Will it pay me to buy Canadian unleached wood ashes to be sown on a meadow that was mown last season, and which I wish to mow again next year? How much should be used per acre?

ANS.—The various conditions are so little known to us that we cannot give a trustworthy answer. At any rate, we should sow, besides the ashes, some form of nitrogen. Ashes, in so far as potash and phosphoric acid are concerned, are a first-rate fertilizer.

W. R. S., Mapleton, Mich.—1. Is it safe to pasture hogs in an orchard after spraying the trees with Paris-green for the coddling moth? 2. Will a wet, swampy piece of ground make a good hog pasture? The water in it is pure spring water and the ground could be drained. 3. What is the average cost of keeping a hog up to the age of six months? What would be its average weight then?

ANS.—1. We should wait a day or two before turning the hogs into the orchard, although reliable experiments seem to show that there is little or no danger even on the day of the spraying. 2. We believe that a portion of a hog pasture should be high and dry. Hogs will do better if they are provided with a dry spot in which to make their bed. 3. We shall have to refer this question to some of our readers.

Discussion.

THE COST OF LIVING ON THE FARM.

H. D., GREENWICH, CONN.—I could not keep any record of family expenses so as to give the average cost of each individual, as the family varies in number according to the number of help kept and of friends who visit us. Usually we are 11 in family. Prices rule here about the same as in New York City markets; if anything, they are a trifle higher here. Our beautiful town is on the highest coast-land between Maine and Florida and is the summer home of many New York families who help to consume most of the local produce, and so keep up our market prices. Now butter brings 30 and 35 cents; eggs, 36; milk, 7; and cream, 35 and 40. These are produced on our farm, but I pay for flour $6 direct from the Produce Exchange, and in town $7, and we use one barrel in three weeks. Sugar costs nine cents and we use two barrels a year; coffee 30 cents per pound and we use two pounds per week; tea, 60 cents, one pound lasts us three weeks; the value of our chocolate, etc., I cannot estimate as we use less of these. Molasses is 70 cents; kerosene by the barrel is 10 cents per gallon, by retail 15; we use two gallons per week. I only use one coal stove in our sleeping apartments; that consumes two tons during the winter. The present price of coal is $6. Wood I burn in four stoves, but that I cut on the farm; price $6 per cord. I agree with O. H. of Greeley, Col., that it costs more to clothe a man than it does to clothe his wife. I know it costs more than twice as much for my clothing, shoes and slippers as for my wife's.

A. R., MARILLA, N. Y.—I have never kept any account of expenses since 1875. My income being very small, I became discouraged and only kept an account of the butter and eggs and other farm produce sold. Then at the end of the year, I would take an inventory of the stock, tools, etc., also of the amounts paid on debts and so find out what my profits had been after paying the farm and living expenses for each year. I have been more interested in the profits than in the expenditures. From April 1, 1875 to September 7, 1875 my total living expense for two except for wood, was $110.54. I had just commenced house-keeping, but cut my own fire wood on the farm. I set down only the items and dates with the cost. From January 1, 1877 to October 19, 1877, our family of two used 156 pounds of sugar: cost $16.94. I wish T. B. Terry would tell us through the columns of the R. N.-Y., what his profits usually are after paying his farm and living expenses; also what percentage they would be on the amount of capital invested in the business of his 50-acre farm. A merchant could tell the rate his capital was paying him. Why should a farmer be unable to do so? My farm has paid as well as any branch of business in this vicinity, in proportion to the amount of capital and brains invested in it. "Farmin' pays."

A. P. A., MEADVILLE, PA.—In looking over my books I find the following footings for the years:

	1883.	1888.
For clothing	$42.08	$49.25
Boots and shoes	13.85	15.75
Groceries	47.28	39.48

The family consists of three adults. I do not have to hire much help though I get a hand for two or three days at a time during a rush. Several nieces and nephews, however, that live in the city, make us a visit regularly every summer, and of course all help at the table. Though keeping a strict account of receipts and expenditures, I have not reduced my system of book-keeping to so fine a point as to open a separate account for each article; but under the head of "groceries" I include tea, coffee, sugar, spices, etc., in fact, everything in the way of groceries. Meat, vegetables and flour we produce ourselves and so no entry of the value of these is made in my grocery account. Occasionally a piece of fresh meat helps to swell the sum total of the bill, but not often, as plenty of eggs and chickens answer the purpose instead and are always at hand.

W. D. P., CAMP SPRINGS, MD.—My family consists of myself, wife and two children, and my mother and a niece live with me, and there is one hired man, making seven in all. The following items are only for myself, wife and two children:

Grocery bill, for 1888		$200 00
Clothing,	"	30 00
Shoes,	"	18 50
Medicines,	"	4 50
Doctor's bills,	"	3 00
Total		$256 00

I do not count what I raise on the farm, such as vegetables, fruits, meat, milk, butter, lard, poultry and eggs, of which we use all we wish either fresh or canned as far as fruit is concerned. We live as well as the majority of our neighbors. I raise fruits and vegetables for market and we have abundance of them for our own table. Some of my neighbors' families do not have strawberries, and several sorts of vegetables they have only when they buy them and that is seldom. I get my wood from the farm. I have accounts for several years, and find they average nearly the same except in the year in which I was married; then my own bill for clothing was larger than that for all the family in any year before or since.

T. B. TERRY, HUDSON, OHIO.—I keep a cash account, and buy almost everything we use and pay cash for it, so it is simply a matter of time and figures to get very closely at what it costs us to live. My family averages six persons, besides company—wife and I, two daughters and a son, all grown up, and hired help equal to one man for the year. In the line of groceries and provisions we consume in a year about six barrels of white flour, Graham and buckwheat, two bushels of marrow beans, 24 pounds of coffee, 12 of tea, 50 of rice, 470 of granulated sugar, a barrel of sweet potatoes, 52 bushels of Irish potatoes, 28 gallons of maple sirup, six of molasses, 20 pounds of dried peaches, 24 of raisins, seven of Royal baking powder, besides the numerous little things that it would take up too much space to mention in detail. It takes about 50 gallons of the best oil to keep our home well lighted. In oil and fuel we never attempt to economize. We used during the last 12 months 85 large-sized cakes of Ivory soap to keep us clean. I suspect our folks do not economize any in soap, as we used not to need so much. Our entire meat bill for the past year, including beef, chickens, pork, lard, oysters, fish, etc., foots up to $73. It is all purchased, as we do not keep even a pig or a chicken. To make those six barrels of flour go down pleasantly required $55 worth of the choicest creamery butter, costing from 18 cents in mid-summer to 26 cents paid the other day for our winter supply. It is many years since I have allowed my wife to fuss making butter from two or three cows—a constant daily drudgery almost the year around. I can make the money on the farm with far less expenditure of the vital force of the firm—wife and I are partners.

Our egg bill for the year spoils $17. It would have gone higher, but we buy eggs in the spring and put them down in lime-water. We are using 10-cent eggs now when they cost about twice that price in market. We drink lemonade in summer, instead of hard cider, which puts $9 on to the cash account. In the way of fruit we consume, fresh and canned, more than 40 bushels of strawberries, raspberries, blackberries, grapes, currants and peaches, besides 20 bushels of apples. Those who wish may live on the "fat of the land;" but as for me and my family we thank God for the fruit. Estimating what we grow ourselves at what we could sell them for at wholesale, our fruit bill runs up to $137—doctor's bills——0.

We grow our own Lima beans, tomatoes, pie-plants and sweet corn. All other little vegetables we find it far better to buy of those nearby who make a business of growing them. The vegetables we do grow are right in our potato field, in rows with the potatoes I might say, in passing, that we aim to grow what is necessary in order to get the best. We can raise better strawberries, raspberries, Lima beans and sweet corn than we can often buy. We can buy as good eggs, butter, chickens, etc., as can be produced. We keep one cow to furnish us milk and cream. I think these would bring at the factory $40 a year.

Now, of course, it is almost impossible to get at such figures as these to a cent, as some supplies are left over from year to year; but our grocery and provision bill for a year, including many little things not mentioned above, does not vary much from $4.83. Thus our eating and drinking costs, in cash, about $1.55 a person, a week. With a little cutting down on the luxuries this might be reduced to a dollar a week. We have lived on considerably less than that.

To keep us warm I bought for this winter seven tons of anthracite coal, at a cost of $5.40 per ton. To do the cooking requires $25 worth of stove wood and oil for a year. The wood costs $1 per pile (of 18-inch wood) eight feet long and four feet high. We use an oil-range for hot weather. About four cords of chunk wood are used up-stairs in very cold weather to help out the big base-burner below, that can ordinarily warm the whole house. We do not live in the kitchen, but in the whole house which is warmed and lighted, as a rule. How it would shock my good mother, if she were living, to see us daily using the best rooms in the house. Total cost of fuel for the year $67, without counting the hauling, which is a very small matter.

What we wear is not so easy to get at correctly. After getting the figures from the girls (I give them $10 or $20 at once, and they buy their clothes, etc., so that the cash account does not show the cost), I have concluded that to dress us all a year, including over-head and under-foot, costs pretty close to $216. I threw out all cloaks and over-coats from the year's account, and then added in $5 a year for each person for furnishing these garments. For example: I bought a new overcoat for $20 and one daughter had a new cloak that cost $28. On the average these will last us about five years, which makes about $5 a person, a year. Then I have had two suits of underclothing; but they will last two years; so only half the cost is put in this year's account. So, although the clothing bill foots up more than we expected, it is pretty close to the truth—$43 per individual. It will not do to count incidentals, such as church expenses, cost of traveling, books, papers, lecture tickets, flowers, etc., at less than $125. For the use of our carriage, sleigh, harness, robes, etc., for pleasure riding, I charge 15 per cent. per annum on their cost, or $50. As we keep no special driving horse I will say nothing about the use of horses.

To get at our real family expenses $80 should be taken from the above $483 for what the hired man ate, when the total will be found to be $861 for our family of five full-grown persons. But there is one other point that farmers are quite apt to overlook in their estimates of the profits of farming. Our farm has paid for and furnished us a nice home to live in. One wouldn't forget it if he had to pay rent for such a house all furnished in town. Our home has cost, including all furnishings, close to $4,000. I certainly could not afford to keep this insured, painted, and in repair and taxes paid, and stand wear and tear on furnishings (including carpets and bedding), together with interest on the investment, and rent to a careful family for 10 per cent. on its cost. But I will lend money to myself cheaply and call the whole use of the home 10 per cent. on its cost. Thus the actual cost of living on our little farm foots up $1,261.

Can a 50-acre farm stand this drain? Yes, and pay a fair interest on its value, thus leaving the owner the above sum for his

labor and supervision. It can do this without counting any income except that directly from the farm, and the farm is hardly run to more than half its full capacity either. Nearly all farmers, like Mr. Greeley, have their own fruits, butter, milk, meat, chickens, eggs, etc. They may get a little idea of what the farm is doing for them in this line by noting what we pay for all these things. My wife says: "Do tell them that we feed the cats pretty well; that will help out a little. I am afraid they will think us pigs from the quantities of provisions bought." You will kindly note that the R. N.-Y. particularly called for this article on our private affairs.

Summit County, Ohio.

LONG ISLAND SMALL FARMING.

T. T., BROOKLYN, N. Y.—It seems to me that the RURAL's correspondents "O. A. F.," "L. I. Farmer," and "H. A. Brown," are not the farmers properly to advise a poor man as to how he can make a living on 12 acres of average Long Island land. They are altogether too high-toned, and evidently have now and always have had sufficient means. W. D. Pyle's letter has the true ring. Farming, like all other vocations, depends more upon the man than on the land. I am a poor city lawyer earning perhaps about $1,200 per year. In my younger days I had about five years of excellent instruction in farming, particularly in vegetable culture. To my mind truck or milk farming amounts to slavery. I would not follow either for the gift of a $25,000 farm, but other kinds of small farming I love, and I have found them profitable. Let me here say that in my opinion the cheapest and best way to clear land of Scrub Oak on Long Island is to do it by a large coulter plow drawn by two yoke of oxen. Hire the oxen if not able to buy them. It is all very well for the few fat and well-to-do Long Island farmers to sneer at the methods of the poor German ones; but do not the Germans usually thrive better with fewer advantages than our small farmers? And why? Simply because they are more frugal and industrious. The small Long Island farmer is, as a rule, shiftless. He can sit in the town store and talk politics all day and consider himself a statesman. Go to his farm and see his house and barn without the paint they so much need; his horse and cow lean; his plow, harrow and tools out-of-doors, and the stable and stock uncleaned for weeks! No saving of manure, no proper frugality and little industry.

Now, I think any ordinary man ought to make at least a living on 12 acres. I own a farm of 14 acres in Hempstead. I bought it because I got it very cheap last summer, and I calculate to make $500 above expenses this year, and if I do not I shall be disappointed, for I have done that much and more before under similar circumstances. Now I would say to the owner of 12 acres: Wait until March next. Then go upon your farm. Get a cheap horse for about $25 at one of the city horse-car stables. Hire a green German by the month at, say, $10. Attend the auctions of second-hand farm implements in your locality, and buy a plow, harrow, hoes, and such tools as you need. Start a hot-bed at once. Plant all the vegetables you want for your family liberally. Buy a cow, plant one acre of corn for fodder for her. Buy 100 chickens and inclose them in a quarter of an acre of wire fence, moving this fence upon a fresh quarter of an acre every month. Shelter your chickens either by excavating earth and covering it like a cistern, giving air and light, or putting up posts eight feet high with cross-pieces on top, or pieces inverted V-shape, and covering the roof with sea weed or leaves, covered with grass in profusion. Have no smaller breed than Wyandottes. The eggs and manure will well repay you. Now, that you have cleared your farm of the Scrub Oak—a man and yourself ought to clear half an acre per day, if the Scrub Oak is light—you will have, say, 10 acres left for crops. Put five acres of it in the best variety of sweet corn you can get. If you cannot have it very early, let it be very late, say, ready to market in September. Put three acres more in late cabbages, and the other two acres in potatoes. Do the work all by horse labor. Keep the cultivator going. Manure the hills all you can on the *top of the ground* after about one month of growth. Write to all the hotels within 10 miles as soon as your crops are ripe, and offer corn at 25 cents less per 100 ears than they may be paying, and push the sale of other things, such as eggs, chickens, vegetables, etc., being careful to grow only the best varieties of the latter. You ought to sell $25 worth of hot-bed plants. With the hired man on the place all the time, you could spend in the winter certainly half of the week in the city at your real estate business. That is what I intend to do as to my business, remaining on the farm the other half. The railroad commutation fare for 20 miles from the city is only $70 per year, and then you can go out and in every day for that sum, if you choose. Then an honest real estate agent ought to stir up some business near his farm, drawing papers, etc. Small farming well conducted pays better than any ordinary small business in the city, if one likes it. Some people (almost all of the ladies, for instance) would sooner live and half starve in a city in some over-crowded tenement-house than dwell upon a fine farm in comfort. It is only a matter of taste. Four out of five of the young city lawyers admitted to practice within one year, either become office clerks or go into other business, and the same can be said of most of the other city vocations. Failures abound, and rich men can live best in the city, of course. The poorer or middle class of city folks, however, would be far better off upon small farms.

THE "BEST METHOD" OF KILLING POULTRY.

C. H. W., ROCHESTER, N. Y.—In a recent number of a "practical" poultry monthly, I find some very concise information given as the "*Best Method*" of preparing fowls for market. I quote the passage in full below, and would ask the R. N.-Y. if it is the method usually pursued by the amateur or professional poultry-man; or whether there is not some other, more practically followed, which is less cruel than the "best," and still free from the objections to the "old method" of beheading, which the same authority informs its readers, "leaves a ragged, bloody, unsightly neck exposed which is *revolting to many sensitive persons.*" If not, I for one would prefer to deaden my feelings to the sight of the "bloody necks" rather than to the horrible barbarity of the "best method."

The passage referred to is as follows—The italics are my own:

"The best method of killing and dressing is to hang the fowls by the feet by a small cord; then, with a sharp knife, give one cut across the upper jaw, opposite the corners of the mouth; after the blood has stopped running a stream, place the point of the knife in the groove in the upper part of the mouth, run the blade up into the back part of the head, *which will cause a twitching* of the muscles. *Now is the time*, for every feather yields as if by magic, and there is little danger of tearing the most tender fowl or chick. Before it *attempts to flap* you can have it picked perfectly clean."

This is not, as the humane reader might suppose, a ghastly joke aimed at the inexperienced slayer in his abortive efforts to extinguish life in the too vivacious fowl, but it is just what it purports to be—concise and perspicuous directions, seriously given, for "killing and dressing by the best method" and in a manner the least likely to offend the supersensitive and æsthetic feelings of the cultured or critical public.

R. N.-Y.—This advice is positively inhuman. It is a bungling, cruel operation, particularly when done by amateurs. When the writer kills a hen he stuns it by giving its head a sharp rap and then chops the head off as quickly as possible. This we believe to be the quickest and best way. It is true, however, that poultry sent to the New York market must be killed so that the head remains on the body. For this trade the birds should be killed at once by thrusting a long, slender knife far back through the mouth into the brain. This will cause less pain and bring death quicker than the butchering process described above.

DRESSED BEEF AND FREE TRADE.

C. H. W., BERGEN COUNTY, N. J.—The recent discussion regarding the effects of the dressed beef business on Eastern farming was interesting to New Jersey farmers, who perhaps more than any other class feel the injury done by this business. It may interest readers of the R. N.-Y. to learn how a local orator takes this dressed beef matter as an illustration of the probable effects of free trade. Years ago, he says, we made our own beef and sold it to local butchers. This represented home manufacturing, for we were enabled to make our own manure, provide winter farm work, make butchering a regular trade and make a profit on the beef. Western farmers discover that they can produce beef cheaper than we can. They can grow heavier crops of hay and grain while their land is not taxed for one-fifth of what ours is. They are cheap producers and they want our market. The standard free-trade argument, as applied to this case, would be that since beef can be produced so cheaply at the West, it should be made there, and brought here and sold to consumers for a lower price than the New Jersey farmer can afford to sell it for. By means of rapid transportation and concentration of capital this plan has been carried out and we may see how the result has borne out the theory. New Jersey farmers can no longer raise beef cattle. They are now obliged to pay cash for manure. They now buy their meat instead of producing it themselves. There are three or four new calls for cash and no new source of income. The price of the dressed beef is no lower than that of our own beef used to be. It was made a little lower while our beef was being driven out of the market, but when once we failed to compete, up the price went again. Nor do Western cattle-men seem to be gainers. They are all complaining about low prices. So, then, free trade in dressed beef between one State and another destroys an important agricultural feature of New Jersey, brings no extra profit to the Western producer, gives the Eastern consumer little or no relief in the way of cheaper prices, and only makes the middlemen, or handlers, rich. Carry out this same result in the trade between a foreign country and our own, and we see our own manufacturers crippled, the laborers of the other country and the buyers of our own but little benefited, and the importers and handlers getting rich.

THE JEFFERIS APPLE AND A FEW OF ITS COMPEERS.

T. T. LYON, SOUTH HAVEN, MICH.—Some weeks since, the RURAL published a notice of this apple by Pomologist Van Deman, of the Department of Agriculture, giving it a very high character. I planted this variety in my trial orchard as early as 1850; and I will not essentially differ from Mr. V— in his estimate of its quality; although I regard it as too high—considerably so, as grown in Michigan. I observe that Downing designated it as "very good," (doubtless as grown in its native region—Pennsylvania) and I found an unmistakable, though slight, deterioration, even with the short northward migration to this State. It is in season through September. My criticism of Mr. Van Deman's notice is based less upon his estimate of the Jefferis than upon the fact (which will probably be admitted to be such by most pomologists, and probably even by Mr. Van Deman himself,) that there are several varieties covering nearly or quite the same season, which take rank considerably higher than this as dessert apples. The following are a few of those to which I more particularly refer:

PRIMATE, ripening in succession, from mid-August to October, is ranked by Downing as "very good" to "best." Its most serious fault is that large specimens are liable to be water-cored.

EARLY JOE, ripening from mid-August to mid-September, ranks as "best." The tree, though a slow grower, is very productive, and the fruit, though slightly lacking in size, is exceedingly beautiful, sprightly and delicate in texture.

GARDEN ROYAL, a Massachusetts apple, ripening the last of August and through September, is classed as "best." It is productive, even-sized, richly colored and mild in flavor. The tree is small and well suited to the garden.

AMERICAN SUMMER, (Pearmain) ripening from the last of August to the end of September, ranks as "best." When well grown, it is one of the most beautiful of apples; very similar to Garden Royal in flavor, although at least twice its size. Other varieties would bear a mention in this connection; but the foregoing will suffice to indicate the true rank of the Jefferis as a dessert variety.

COMPARATIVE PROFITS FROM LARGE AND SMALL COWS.

A CONNECTICUT FARMER, FAIRFIELD COUNTY, CONN.—I infer by the remarks in the R. N.-Y. at different times that the friends of Jersey cattle claim that because they are small, it therefore takes less to keep them than to keep animals belonging to larger breeds. Now for over 20 years I have had the care of a dairy varying in size from 15 to 23 cows, and at the same time I have looked after other stock, and my experience has been that Jerseys and other stock of that class are, as a rule, harder keepers than the animals of the larger breeds, or, in other words, it takes more grain, besides hay or grass, to get a dollar back in products and then the Jerseys generally do not keep in as good condition as the others. On the same ration which would keep a large cow gaining and at the same time giving a good flow of milk, the smaller one would almost always lose in milk and condition. There are, to be sure, exceptions. Some of the smaller cows are closely and compactly built, and some of the larger ones are coarse and raw-boned; but I am speaking of average herds of both kinds. There are more exceptions in the Devon breed than any other. My principal business was selling milk, but at times I made butter and sometimes fattened calves, and I think there is more profit in a cow that will give a large quantity of milk (even for butter) than from one that gives only about half as much, providing both make the same number of pounds in a year. Why? Because the skim-milk of the larger animal is worth so much more, not only in quantity but in quality.

"DISEASED LIVE-FOREVER."

O. O. S., FREDONIA, N. Y.—I notice in the R. N.-Y. of October 26, a communication from W. H. C., East Freetown, N. Y., about "live-forever," in which he says that a diseased root of it, if introduced among healthy roots, will just make 'em sick. Now I'm just pining away for a diseased root. Give, O give me a diseased root! Where can I get one? Mine are awfully healthy—just "bustin' wid health." Can the R. N.-Y. put me in connection with W. H. C.? Or has it a "diseased root" around the office or the experiment grounds? What is the distinctive feature of a "diseased root?" Any light in this Cimmerian darkness, this grim gloom, will brighten the path to the tomb of live-forever.

FROM W. H. CALDWELL.

O. O. S. can procure a "diseased root" or a root of diseased live-forever by addressing me. One may set out a root of diseased live-forever in a patch that is "just bustin' wid health" and in about three months he will see "awfully healthy" roots begin to pine away. The stalks will begin to die just above the ground, and the roots will turn a reddish color and begin to rot. Then these roots may be taken out and planted in other fields of the "awfully healthy" pests. It takes about two years to rid a piece of the nuisance.

IS BRAN, BRAN?

J. B., FRANKLIN, TENN.—In one of the back numbers of the R. N.-Y. a certain professor claims that the new roller-process bran is as good as or even better than the old-fashioned mill bran. It may be so in an analyzing pot; but not in the cow's stomach. Is bran more valuable and wholesome with nails, screws, long sack needles in it and therefore in the cow, than the coarse, clean, old-fashioned country mill bran? Just look in an old dairy cow's stomach and you will be astonished. I have found an alarming quantity of such stuff in the stomachs of cows that were killed because no longer profitable for the dairy; they were not sick either; they merely failed at the pail and were not thrifty to sell for beef. Cannot the bane of the dairy business (abortion) be traced to this source? Has a miller a right to sell floor sweepings, dust, cheat, cockle, etc., for bran? Why is cockle in the bran whole, and not ground up like the wheat? Is it separated from the wheat before the latter is ground and then thrown into the bran? If I had a valuable herd of cows I would not feed bran, but what is a substitute for it? What can a farmer feed to cows for milk or butter production besides corn-meal?

What Others Say

TALK OF AN ENGLISH FARMER.—An interesting talk with Mr. Burpitt, an English farmer who has settled near Atlanta, Ga., is given by a writer in the Southern Farm. He says: "Think of a farmer after his day's work is done, working until 10 or 11 o'clock at night by moonshine. Think of his refusing to stop at his work to talk to a visitor, but carrying the writer at a dog-trot with him up and down his furrows. Think of a farmer who stands by three rules: 'Not an idle day in the year;' 'not an idle acre on the farm;' 'not an idle hand in the family.' And what a wonderful island is Jersey, of which he tells—only seven by 12 miles, and yet supporting 63,000 people out of the soil—and covered with 1,800 miles of glass frames. And how a farmer is ridden there, giving one-tenth of all cereal crops to

the church, paying a tax on every calf that is born, and paying a rent of $35 per acre, and taxes almost as much more. What a godsend America is with its cheap land, its low taxes, its church separate from State, to such a farmer. Mr. Burpitt truly says that if the English farmers knew what a future there was in Georgia for them—what happiness and independence—the ships of the ocean could not bring them fast enough. Can't we learn something from the frugal and saving and industrious habits of this Englishman? Does he not tell us of many things that we need to learn. What is wasted on a Georgia farm, if saved, would make the farmer rich."

LEAVES FOR TEACHERS.—In a late lecture, at the Royal Institution, Sir John Lubbock, the eminent naturalist and statesman, gave an account of the adaptation of the forms and surfaces of leaves, with diagram illustrations showing that the "wonders of the leaf" are by no means confined to the fittings of their internal structure. He showed reasons, founded on the nature and habit of the tree or plant, for all the various shapes, sizes, manner of position on the stems, and spacings of leaves and blades. For example, a stout stem carries a large leaf. If the distances from leaf to leaf (from bud to bud) are constitutionally great the leaf will be broad. If stems of an equally stout habit bear closer buds, the leaves are compelled to grow to a greater length in order to attain a proportional area of surface. Leaves that expose both sides to light and heat have stomata on both sides—(the mouths which gape open in damp weather to give off redundant water, as a fowl or dog gapes in summer to give off excessive heat). The Black Poplar and the Compass Plant are examples of this. In very hot, dry climates leaves become smaller and fleshier, and stomata fewer; often the leaf stem flattens out in Australian plants and the leaf proper shrinks as in asparagus which belongs to the large-stomated lily tribe. In evergreens, some of which retain a leaf three to six or more years, the leaves are small, tough, leathery, often spiny and glossy, shedding rain or snow readily, and are protected by a pungent taste.

Leaves furnish abundant matter for a whole summer of daily object-lessons of never-ending interest, and every teacher should be prepared to lead his young charges into these pages of endless interest from the book of Nature, from Arbor Day on.

THE RURAL'S LUNCH.

THAT first-rate farmer G. W. Hoffman, ex-president of the Elmira Farmers' Club, says in the Husbandman that he has been slow in adopting the use of ensilage. But others are outstripping him and he believes that every farmer who carries on successfully the milk or dairy business, will eventually adopt the use of silage as the leading food for his cattle.....

A CORRESPONDENT of the Michigan Farmer guards its readers against a "Toledo nursery," name not given. The agents are selling the Lucretia Dewberry for from $10 to $40 per hundred and other fruits in proportion.....

A. L. CROSBY under the caption, "A Cow—Hen Item," in Hoard's Dairyman, says that butter, cheese, and eggs are three manufactured products that when well made and in sufficient quantity per animal—cow or hen—will pay a good profit. The egg is just as much a manufactured article as butter or cheese, only in egg-making we use the hen as the mill and put the raw material in it to be made into eggs. Among these raw materials skimmed milk is one of the most valuable, and it is to this by-product of the butter dairy that he wants to call attention. There has never been such a good supply of eggs on his farm since he has known it as during the year about to close (his hen year ends November 1), and he attributes much of his success to the fact that the hens have had nothing to drink but skimmed milk. The hens are not allowed free range of course; free range means the loss of many eggs, the hatching of chickens at the wrong time, the free distribution of fertilizer on farm implements and family carriages, scratched-up gardens and the complaint of the cussedness of hens in general, and our own in particular.....

THE AMERICAN FLORIST mentions a new tree label sent to it by Johnson & Stokes of Philadelphia, Pa. It is so thin that by writing on it with only slight pressure a name can be impressed on it and the same cannot be eradicated except by hammering. As copper is very durable and the price placed upon the labels is reasonable we believe they will be very useful, especially on plants in the open field in summer. The R. N.-Y. proposes to try these labels and report results to its readers. Our trouble with zinc labels is that the zinc oxydizes and the fine whitish powder effaces or destroys the lead-pencil writing. Some samples of zinc are affected in this way, others not. The R. N.-Y. would much like to know how to tell the one kind from the other.....

THE common and much advertised "Moonflower" plant sold by florists and Ipomæa bona-nox grown from seed (dark in color) are indistinguishable. So says Wm. Falconer, in the American Florist, and so said the R. N.-Y. when the trumpet of the "Moonflower" was first blown. Ipomœa grandiflora, on the other hand, continues Mr. Falconer, from the New York seed houses and Ipomœa Childsii, and the White-seeded Moonflower raised from seed gathered for him in the wilds of Southern Florida are one and the same. They are more luxuriant in growth than is Bonanox and their blossoms are one-fourth larger. The R. N.-Y. last year raised this Ipomœa from little plants sent to it by A. W. Smith of Americus, Ga.....

PRES. CHAMBERLAIN of the Iowa Agricultural college, says, in the Albany Cultivator, that the Duchess of Oldenburgh, a splendid fall apple, is quite hardy at Ames, Iowa, fruits while the trees are small, and bears most prolifically. This is the only well-known apple that is now considered hardy there. The college experiment orchard most of it planted eight years ago, has a large number of new and most promising fall and winter Russian varieties. The yield this year was immense; several hundred bushels. It was the first fruiting of some of the kinds, and the test of "quality and keep" through the winter will be watched with great interest.....

MR. HARRISON, of the Storrs & Harrison Co., pronounces the following the cream of the winter-flowering roses: Bon Silene, Catherine Mermet, Duchesse de Brabant, Isabella Sprunt, La France, Meteor, Niphetos, Papa Gontier, Queen's Scarlet, Perle des Jardins, Safrano, Souvenir d'un Ami, Sunset and Bride.....

THE GLORIOUS "SUNSET" PLANT.—An illustration of this from nature appeared in the R. N.-Y. of August 3 last. William Falconer says, in the American Florist, that it is too glorious at 50 cents a plant when it can be gotten up so easily from seed, and seed is retailed in New York for five cents a packet. He has grown some of the Western sphæralceas for a dozen years and now has scores of plants of this glorious novelty. They are very hardy and long-lived and last in bloom almost all summer, but there is nothing striking about the plant or blossoms; the flowers are small and of a poor color: among cut flowers of no value whatever, and precious little among border plants.....

THE WESTERN RURAL in answer to a correspondent who inquired if Montana was a good place for a young lawyer, says: "We cannot answer that question. The law is out of our line, and we do not know where the best place for lawyers is in this world." Our contemporary evidently doesn't wish to help boom Montana.....

ABSTRACTS.

——EDITOR OF THE IOWA HOMESTEAD: "Horticulture is a sentiment in Iowa—corn, grass and live stock give us our daily bread."

——POPULAR SCIENCE MONTHLY: "The farmer pays for a paper, as likely as not, which tells him, and has been telling him for a generation or more, that the beneficent system which prevents him from buying 4,500 articles as cheaply as he might, and compels him to sell his own products, minute in number, at the lowest price which ingenious legal artifice can dictate, is a measure for his particular benefit."

——LONDON AGRICULTURAL GAZETTE: "There are signs that the country will not much longer submit to the meddling and muddling policy of the Government in relation to pleuro-pneumonia. In Scotland, in Ireland, and in Yorkshire the cry of dissatisfaction has become vociferous. Ratepayers and stock-owners alike are disgusted with a policy which costs enormous sums yearly to carry out, and which has utterly failed to rid the country of a preventable disease, or even to diminish its ravages to a commensurate extent. * * * Many of the complainants in Scotland, Ireland and Yorkshire have asked for the total or partial cessation of slaughter as a means of extirpating the disease."

——JOURNAL OF COMMERCE: "We once heard from the lips of an extreme partisan, that he would vote for an imp of darkness (and he described him in a single word) who was the nominee of his party in preference to an angel of light put up by the other side."

——BOSTON COURIER: "It has been observed that the man with the fewest failings is the man most tolerant of those of his neighbors."

——JOURNAL OF COMMERCE: "Self-denial is not only the law of greatness and of goodness, but also of all material success. The great bane of the poor, by which we mean those who live from hand to mouth, is their want of a resolute self-denial in the use of their daily or weekly earnings. And this runs all the way up to the man of business, who wastes his thousands a year through self-indulgence on the part of himself or his household, and finally goes down in credit and pocket for want of the capital which might have been gathered in the exercise of a proper self-restraint."

——ROBERT INGERSOLL: "A wonderful thing is clover. It means honey and cream; that is to say, industry and contentment; that is to say the happy bees in perfumed fields, and at the cottage gate, Old Bos, the bountiful, chewing satisfaction's cud in that blessed twilight pause, that like a benediction falls between all toil and sleep. The clover makes me dream of happy hours—of childhood's rosy cheeks, of dimpled babies, of wholesome, loving wives, of honest men, of springs and brooks and violets, and all there is of painless joy in peaceful human life. A wonderful word is clover. Drop the "c" and you have the happiest of mankind. Take away the "c" and "r" and you have the only thing that makes a heaven of this dull and barren earth."

——PUCK: "A bird in the hand is worth two in the bonnet; but it does not cost as much."

——COMMERICAL BULLETIN: "Ovacoats—Egg shells."

——EX-SECRETARY OF AGRICULTURE, NORMAN J. COLMAN: "This whole system of speculation in futures is wrong. It has been the cause of the loss to wheat growers of hundreds of millions of dollars. It unsettles prices. It creates fictitious values. Millions of bushels of promises can be sold, and not one grain of wheat be delivered. It is not selling wheat but selling wind—or selling nothing. But, by just such gambling transactions, having no relation to demand and supply, the market can be put down or up to suit the speculators, and, in nearly all such transactions, the farmers are left."

——"People don't stop to consider the farmer is a laborer. No one labors harder. He has no eight hours or even 10 hours' law to protect him. From the earliest dawn to the darkest twilight he is toiling with the endeavor to make a living for his family. No matter how intense the heat or how severe the cold, he must keep up the struggle. Sick or well the work must go on. Half our population nearly are farmers. Has this great class no rights? Shall they continue to be taxed by a protected class until they become paupers?"

——"The farmers are ignored. The interests of the real creators of wealth are lost sight of, that manufacturers may amass great fortunes. They are taxed by these classes on everything they buy; not to go into the coffers of the United States Treasury, but to go into their own plethoric pockets. Their princely residences, their liveried servants, their costly turn-outs in every manufacturing town, testify to the wealth they are making, and the farmer is toiling early and late and by the sweat of his brow, supporting them in this style of living."

——N. Y. HERALD: "In comparison with the fashion in which that World's Fair fund is rolling up the speed of a snail is so rapid that it positively takes our breath away. There is a curious impression abroad, of which the public mind ought to be disabused at once. This fund, fellow citizens, is for the Columbus exposition of 1892; that is to say, for the four-hundredth anniversary of the discovery of America, not for an exposition five hundred years from now, or for the one-thousandth anniversary of that great historic event. If we were preparing for a celebration in the year 2,392, we might congratulate ourselves upon having made a very good start, with a fair prospect of raising the necessary sum in time. We shall not be here, however, on that magnificent occasion, unless the elixir of life turns out to be more effective than it hitherto has been, and therefore leave to our descendants the responsibility of that occasion.

As for the exhibition of 1892, we must either claim it at once or surrender our rights to that young giant of the West, Chicago, who has pulled out his wallet, plethoric with big bills, and planked it down in guarantee of good faith. New Yorkers don't run much to monuments and expositions and such things, and every acre of the Park is so precious that we shall probably end by breaking every man on the wheel who votes to tear up one of its grass blades or scrape the moss from one of its rocks. Chicago has no reverence for natural beauties, and is enterprising enough to carry the project through if it takes every park she owns. After all, New York is the best monument of the Republic, and it is itself an exposition of all that is noblest and grandest in modern civilization. Perhaps it is the proud consciousness of these facts causes us to delay. Let Chicago take the hint and go ahead."

——LIFE: "With Chicago the Fair is a matter of vital importance. That enterprising city has prairie lands for sale and a speculative arena that needs new victims. It needs to make money out of the wayfarer and sojourner to pay the interest on the mortgages with which it is plastered. Chicago's existence has from the first been a boom, and the boom must not be permitted to collapse. Its citizens, including even the women and children, can well afford to go crazy on the subject and devote to it as much money, bluff, time and talk as they have in their respective possessions. Chicago must have the fair at any price. New York may stop to consider its cost. With Chicago it is a necessity. With New York it would be a luxury."

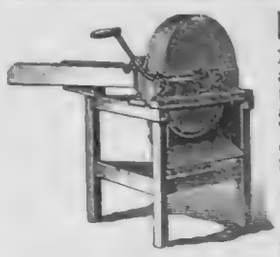
Miscellaneous Advertising.

Hood's Sarsaparilla 100 Doses One Dollar

Dyspepsia's Victims are numbered by thousands. Do not continue in misery, but give Hood's Sarsaparilla a trial. The many remarkable cures it has effected warrant us in urging it upon your attention if you suffer from indigestion, sick-headache, biliousness or other stomach disorders. Be sure to get Hood's.

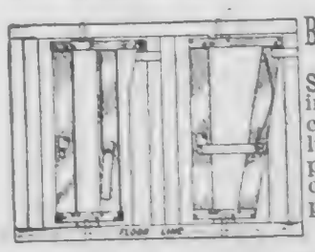
NOTHING ON EARTH WILL MAKE HENS LAY LIKE SHERIDAN'S CONDITION POWDER

Highly concentrated. Dose small. In quantity costs less than one-tenth cent a day per hen. Prevents and cures all diseases. If you can't get it, we send by mail post-paid, One pack. 25c. Five $1. 2 1-4 lb. can $1.20; 6 cans $5. Express paid. Testimonials free. Send stamps or cash. Farmers' Poultry Guide (price 25c.) free with $1.00 orders or more. L. S. JOHNSON & CO., Boston, Mass.



DICK'S FEED CUTTER

For Hay, Straw and Ensilage. *The only machine that cuts and splits corn stalks.* We also sell the TRIUMPH STEAM GENERATOR, and GRIFFING'S CORN SHELLER AND SEPARATOR. Write us at once **H. B Griffing, Sons & Co., 70 Cortlandt St., New York City. N. Y.**



BOON to DAIRYMEN

Perfect Swinging Cow Stanchion. Self-locking by entrance of cow's head. Free delivery at principal points. Send for circular. Mention this paper. **Scott & Locke, Orford, N. H.**

THE
RURAL NEW-YORKER,
(34 PARK ROW, NEW YORK),

A National Journal for Country and Suburban Homes.

Conducted by
ELBERT S. CARMAN.

SATURDAY, NOVEMBER 23, 1889.

NOTICE.

THE RURAL NEW-YORKER is invariably discontinued at the end of the term subscribed for. Any copies sent to non-subscribers are sent without charge as specimens merely.

MR. TERRY, on page 773, estimates that each member of his family eats about three barrels of potatoes yearly. Is that an average of potato consumption *per capita*?

"THE RURAL NEW-YORKER has been the most profitable instructor I have had since I changed my occupation to farming. I began this late in life, but feel more interest in the business than in any I have followed, although I spent over 40 years in the printing office, from devil to editor and proprietor."

Thus writes a Michigan subscriber. It would seem that there is still hope in agriculture while a man can make such a statement as this.

"IN order to succeed with poultry, one must be part hen himself." So said a farmer the other day in speaking about the possibilities of farming. It is equally true that a man must be part sheep or part cow or part horse in order to succeed in caring for either of these animals. And it is equally true that a good book-keeper must be part book and a good tailor part cloth in order to excel. Success in these days comes only to those who absolutely master some one thing; who stick to it and study it until they absorb from it the secret of success.

"*So far as I have tried them, I can recommend red squirrels as the best of rat-traps.*"—So says Prof. Cook on the first page of this issue.

IT is with very sincere regret we learn of the burning of the home buildings of our friend and contributor Dr. T. H. Hoskins. Not only were the buildings destroyed, but all the contents of his seed-rooms. Not a thing was saved. All of the varieties of corn, peas, beans, etc., over which he had worked for years were wiped out. His nominal loss, outside of insurance, is $3,000, but this does not include the greater loss of the varieties referred to. This is a severe blow to Dr. Hoskins at his age, which though not great, puts him, nevertheless, at a time of life when one is reluctant to plunge in and repair by arduous work such sad misfortunes.

A FINE QUALIFICATION.

A NEW correspondent of the R. N.-Y., who lives in Livingston County, N. Y., thus states his reasons for considering himself qualified to write about agricultural topics:

"We, that is, father, brother and myself, have about 900 acres of land in this county divided into four farms, three of which are worked on shares by tenants. The products of the four farms for the present season are as follows, in round numbers:

5,000	bus.	wheat	av'ge	y'ld	per	acre	26½ bu.
2,500	"	barley	"	"	"	"	85 "
2,800	"	oats	"	"	"	"	40 "
7,000	"	ear corn	"	"	"	"	100 "
850	"	potatoes	"	"	"	"	70 "
436	tons	hay	"	"	"	"	2 tons

As to stock, we have at present 116 head of cattle, 41 horses, 44 hogs and 200 sheep. We expect to feed this winter, for the New York market, 600 sheep and three or four car-loads of steers. We have used a car-load of fertilizer this and in fact every season and work all our corn, straw, coarse fodder and three-quarters of our hay into manure, thereby making the land more productive every year besides paying six per cent. net."

So it seems that farming on a large scale is not confined to the West exclusively. We feel sure our readers will be interested to learn of the methods employed on these four farms.

THE COST OF FARM LIFE.

THE figures showing the cost of farm life, which appear on page 773, are very interesting. Such comparisons are valuable. That much-desired surplus which we all want for a "rainy day," is to be obtained more through what we save than through what we earn. In these times it is hard to save money unless the members of the family make a business of self-denial and studied economy. In a general way it may be said that if our neighbor can obtain food, raiment and true happiness at a cheaper rate than we can, he has an advantage over us as great as the superiority of his farming methods which enables him to produce a larger crop than we can grow. Let us study the various statements as they appear in the R.-N.-Y. Are our own expenses greater or less? In what items can the difference be found?

Another point of value about this matter is suggested by a subscriber as follows:

"It is to be hoped that the inquiries made by the R. N.-Y. into the domestic expenditures of farmers and the answers thereto, will induce many persons to keep accounts of their living expenses in future. Too many farmers do not know anything about their receipts or expenditures. At the end of the year they find out from their creditors how much they are in debt, and this is the extent of their knowledge in business. If they could be induced to read the RURAL NEW-YORKER one year they would be wiser and no doubt richer too."

ISN'T IT TIME?

SMALL wonder this country is flooded every year by a tidal-wave of foreign immigration, much of it very undesirable. Besides the genuine attractions it offers to the poor of other nations in the form of remunerative employment; to the adventurous in the form of a host of opportunities for rapid enrichment; and to the oppressed in the form of freedom from the tyranny of exacting militarism, grinding taxation and despotic rule, numerous swindling allurements help to add a multitude of ignorant, credulous and avaricious dupes to the incoming throng. Railroad and steam-ship companies dot the continent of Europe and the islands of her seas with agencies whose chief business is to beguile passengers for profit, even by all sorts of delusive misrepresentations; land syndicates and manufacturing and mining magnates and corporations here are equally unscrupulous in securing foreign settlers and workmen; and, worst and most heartless of all, many of the countrymen of the victims, on this and the other side of the Atlantic, cause thousands of poor peasantry to abandon their homes and cherished associations every year, to seek in vain here for an illusive Eldorado which had been glowingly pictured to them as a substantial reality by their deceitful compatriots.

It is seldom that slow-footed justice overtakes these rascals, but she does occasionally. Last Thursday, at Wadowice, in Austria, 65 persons were put on trial charged with swindling a multitude of Galician peasants by inducing them to emigrate to America by false statements and then obtaining a commission on their passage money. Among the accused are a Commissary of Police, the Comptroller of the Customs, a Hungarian Judge and a number of Customs officials. In addition to making large sums by deporting credulous rustics and villagers, the swindlers made "enormous gains" by threatening to expose military deserters to the authorities unless they paid exorbitant figures for passage and outfits. In one year 5,799 deserters were dispatched in this way. Surely it is high time to regulate immigration, not only for the sake of the well-being of our own countrymen, but also for the protection of many of the immigrants.

THE VOTERS SHOULD SPEAK.

FROM present indications there is no doubt that a strong effort will be made in the next Congress to repeal the duties on raw sugar without touching those on refined. To silence dissatisfaction among domestic producers, it will be proposed to compensate the sugar-cane planters of Louisiana, the sorghum growers of Kansas and the sugar-beet ranchers of California by a bounty on raw domestic sugars. This would enable the Republican party to reduce the revenue, according to its promises, while harmonizing conflicting interests. Moreover, the measure could be advocated as a compliment to our South American guests as a step towards commercial reciprocity with the nations of this Western Hemisphere. True enough, more than three-fourths of all our imports of raw sugar come from the French, Spanish, Dutch and English, West Indian possessions and other parts of the globe which are wholly outside the reciprocity scheme now being discussed in this country. Most of the commercial advantages of the proposed measure would therefore accrue to this country's commercial rivals. So long as our manufacturing interests are favored by a protective tariff, it would evidently be unfair to ruin the home producers of raw sugar by the removal of similar protection, unless they were reimbursed by bounties equal in amount to the duties removed. The aggregate of these bounties would form only a comparatively small proportion of the loss of $50,000,000 inflicted annually on our fiscal revenue by the repeal of the tariff on raw sugar. Who would be the real gainers by the proposed legislation? Would it be the sugar consumers at large, or the sugar refiners—the public or the Sugar Trust and its competitors? Would the prices of refined sugar be lowered in proportion to the duties abrogated, or raised in proportion to the Treasury bounties paid to the domestic producers of raw cane, sorghum and beet sugar; or would prices take a medium course? It is evident that the whole matter would depend almost entirely on the action of the sugar refiners, whose business is now virtually in the control of only two parties—the Sugar Trust and Claus Spreckels. Has their policy hitherto been of such a character as to justify the public in expecting fair and equitable dealings at their hands when their own interests are intimately concerned? Many insist, as the only real safeguard for consumers, that duties on raw sugar should not be repealed unless those on the refined product are swept away at the same time. What does the mighty constituency of the farmers of the country say on the matter?

THE KNIGHTS AND THE ALLIANCE.

ONE of the most important subjects discussed by the Knights of Labor at their convention at Atlanta during the week, was the advisability of federation with the Farmers' Alliance, the most aggressive association of agriculturists. Such federation would mean a union or league for political and also, where desirable or practicable, for economic purposes. To a great extent such an alliance has already been in operation for some time in Texas with fairly satisfactory results. The order of the Knights of Labor is composed wholly of operatives in various non-productive vocations; while the members of the Alliance are all producers. What could, in theory, be more advantageous to both parties than a combination of producers and consumers? The interests of both, however, do not always run in the same or parallel lines. To begin with, while it is to the benefit of the producers to obtain high prices for their goods, it is to the benefit of the consumers to pay low prices for the same commodities. Both classes, however, could secure these antagonistic benefits, in part at least, by dividing between them the large taxes now levied on both by middlemen. An economic union for the direct transfer of products could accomplish this desirable object. Again, the Knights are fighting for higher wages for labor; the Alliance men complain that farm labor is already too high-priced for the profits from the farms.

Once more, the means adopted by the Knights for compelling higher wages are often very detrimental to their proposed allies. The great railroad strike by the Knights on Gould's southwestern system three years ago, and that of the kindred organization, the Brotherhood of Locomotive Engineers, on the Quincy system one year ago, inflicted losses running high among the millions on the farmers and stockmen of a dozen or more States and Territories. There are several other points also in which the economic interests of both classes to a minor extent clash; but there are likewise several in which one class could well advance the pecuniary welfare of the other. Politically and economically the interests of both alike are particularly antagonistic to reckless public expenditures, to high and unfair taxation, to unscrupulous cornering of food products, to all sorts of monopolistic exactions, and to all legislation discriminating in favor of capital against labor. Surely there are many purposes for which the Knights and the Alliance, and the classes they represent, could unite with mutual and reciprocal advantages.

"*Those who wish may live on the 'FAT of the land;' but as for me and my family we thank God for the fruit. Estimating what we grow ourselves at what we could sell them for at wholesale, our fruit bill runs up to* $137—*doctor's bills*—0."—T. B. TERRY, page 773.

BREVITIES.

CONCORDS are still selling as high as Catawbas.

WHY do you cover your cabbages heads down, roots up?

READ what Prof. Budd says about mulching orchards with Japan Buckwheat—page 772.

"WIFE and I are partners." See page 773. That means industry, cheerfulness, goodness, happiness.

JOHN GOULD of Ohio writes: "My silage this year is splendid. It cost about $4. per acre to cut and put in the silo, or 22 cents per double load of 2,000 pounds."

THE white grape Antoinette (Miner) seems to be little known. It is one of the hardiest varieties grown at the Rural Grounds and its quality is better than that of Concord.

QUITE a good deal of complaint about tough pork comes from farmers this year. Many charge the trouble to the account of extra milk feeding. Have you noticed it? How do you account for it?

HOW much is an acre of apple trees worth just coming into bearing? The trees are supposed to be varieties adapted to the climate and planted in a fertile soil. How much is an acre of peaches worth? Of quinces? Of pears?

OUR hired man said last evening: "That is the best paper you have," as he laid down a copy of the RURAL NEW-YORKER and we have five weekly papers and get quite a number of monthlies. And I think he is about right. S. H. R.
Cabot, Vermont.

THE R. N.-Y. has just completed the planting of no less than 2,000 seeds, the result of hybridizing Teas and Hybrid Remontant roses upon Rosa rugosa. They were planted an inch apart each way in shallow square boxes of mellow garden soil. These boxes, protected by a frame, will be kept out-of-doors until February when they will be removed to the house and placed in the conservatory.

"POTATOES, whether early or late, should never be left in the ground long after the vines die." So say our contemporaries. It may be good advice. But the R. N.-Y. gives its own experience, right or wrong, for what it may be worth. *Late* potatoes mature so late that there is not much time before frost to leave them in the ground. Let the season be what it may, there is not the slightest chance of their sprouting, and, as we believe, they had as well be left in the ground until frosts are threatened, as to be harvested earlier.

THE R. N.-Y. has not been able to find any better fowls for eating purposes than the Dorkings or their grades. Light Brahmas, unless full-grown, are found to be tough and bony. Leghorns we do not care to eat at all. Wyandottes and Plymouth Rocks are excellent but lack the abundance of breast meat found in the Dorking. The experts tell us that a great development of breast in poultry is due to the excessive use of the wings. Our Dorkings are quiet birds not given to flying, yet they are "as broad across the breast as they are long in the back."

Arboricultural.

THE PARAGON CHESTNUT.

Eds. R. N.-Y.:

SEEING a note in a late issue of the R. N.-Y. in regard to the Japan chestnut sent to the editor by Mr. Kerr, we take the liberty of sending some samples of this

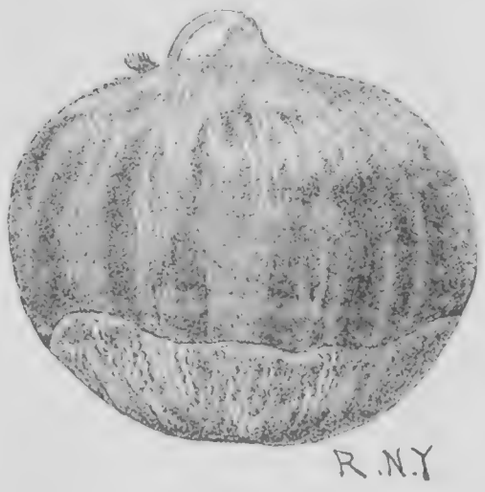


Fig. 279.

year's Paragon, and ask how much smaller are they than the Japan?

Marietta, Pa. H. M. ENGLE & SON.

R. N.-Y. A correct portrait of one of the chestnuts sent is presented at Figure 279. The quality of these chestnuts is nearly as good as that of American chestnuts. Of course, the flesh is coarser, but it is free from the bitterness and astringent taste of Japan chestnuts in general.

The scarcity of chestnuts in the New York markets this year has renewed the discussion regarding the possibilities of nut-growing as a business. There are many farmers who claim that the chestnut crop can be made to compare favorably with the wheat crop from a financial point of view. The R. N.-Y. proposes to investigate this matter and will secure the views of some of those who advocate the planting of chestnut trees for commercial purposes. If some of our waste lands can be utilized by means of this crop, we want to know about it, and at the same time we do not wish to induce our friends to take up a useless labor.

Woman's Work.

CONDUCTED BY EMILY LOUISE TAPLIN.

CHAT BY THE WAY.

WHEN one is tired and chilled and suffering from the nausea which results from going too long without food, we think no other stimulant is so effective as a cup of scalding-hot milk. As a rule, most stimulants may be compared in action to a whip and spur, which may irritate the poor, tired frame to temporary activity without any lasting benefit. But the milk is a food too: often persons who cannot drink cold milk without nausea or indigestion can take it readily when scalded. A cup of scalding milk is certainly an admirable "night-cap" for a chilly person to take when going to bed in a cold room. It warms one through and through, and the warmth is lasting.

* * *

SO MANY of us who live in country homes are compelled to sleep in extremely cold bed-rooms—not at all a hardship to a robust person, but a very serious matter to a thin-blooded or delicate woman. Such a one will often lie awake literally all night, aching with cold, to get up in the morning depressed and nervous, lacking all vitality, and in a condition to become the prey of any disease. It is impossible to entirely obviate this trouble, but it is certainly an additional comfort to sleep in flannel. Not merely between blankets, but also to wear a flannel night gown. Many people simply retain the merino or flannel undergarment they wear during the day, wearing it under a muslin night-dress, but this is a practice to be condemned. It can only be regarded as unhealthful not to say unclean.

* * *

A RECENT RURAL gave a recipe for Graham gems, and no doubt a very good one. But it contained baking powder, which is objected to by many believers in what is called hygienic diet, of which coarse Graham flour forms an important part. Better than "Graham" is the "entire wheat" flour, which is fine, but dark colored, containing all the nutriment of the grain. We make delicious gems from this flour without any "raising" whatever. The two indispensables for success are iron pans, thoroughly heated, and a very hot, steady oven, which bakes well from the bottom. Put a pinch of sugar and a pinch of salt in your mixing bowl. Beat two eggs, and pour them into a half-pint cup; fill the cup up with milk. Pour this into the bowl; then half fill the cup with milk, and fill it up with water. If milk only be used the gems will be tough. Add the milk-and-water to the eggs, stir it all up and then begin to stir in the flour. Put enough flour to make a stiff batter that will just drop off the spoon. Fill the little pans level full; they must be well greased and thoroughly hot. Put the gems on the bottom of the oven in a very hot place, *and do not open the oven door to look at them for half an hour.* If you do they will sink at once. At the end of this time they should be well-browned, and puffed high up, but examine the bottoms; if they are not uniformly brown there is still danger of a collapse, so they must be put in the oven for some 15 minutes longer. Rightly made, these gems are as light as a feather. Eaten hot, they are delicious, but they are also excellent cold, and are superior to ordinary bread for dyspeptics, or sufferers from any disease of stomach or bowels. But if the oven door is opened prematurely, or if it is not hot enough on the bottom, the unfortunate gems are apt to come out thinner and flatter than they went in.

* * *

"HYGIENIC food" is often rather a delusion, as far as ordinary humanity is concerned, but there are plenty of people who would be far healthier if they used entire wheat flour, to the exclusion of the white dust we generally use. The trouble with much so-called Graham flour is that it is ordinary flour with bran mixed in; it seems as if the entire grain is not ground up together, and we unquestionably lose a good deal of nutriment. The entire wheat flour gives all the nourishment, and must be recommended, though in making ordinary yeast bread with it we should recommend the addition of a handful of bran, to prevent it from being too moist.

SOME HOLIDAY BOOKS.

OLIVE E. DANA.

THE holiday books are especially dainty this year, and some of them have interest and value for more than Christmas-time. Among the latter class are two pretty volumes from the Riverside Press: Ballads, Lyrics and Sonnets, from Longfellow, and Interludes, Lyrics and Idyls from Tennyson. The contents of the former are especially attractive, including with the hundred selections given, some of the most beautiful and best known songs of the poet of the Charles. Without illustration, its fair print, broad margins, gilt top and lettering, and the unique blue and white combination of the cover, invite comparison with other more pretentious gift books. And the companion volume is as comely, with green instead of blue in the binding. I suppose the book which lies beside them before me, and which I have been examining with interest, may hardly be called a holiday volume; yet it is not unsuitable. "Character and Comment, selected from the novels of W. D. Howells" is its title. Mr. Howells's insight—for it is more than penetration—that peculiar, feminine instinct of his, we all know is marvelous. And he has, too, a genius for expression. Moreover, he has a rarer quality—not so often attributed in due measure to him—sense. These three elements can but crystallize in incisive, piquant sayings, in delicious repartee and pungent reflection. So all the bright bits and hits, which the reader of novels is sometimes the last to appreciate, and the non-reader of novels of course will not get at all, are gathered here. It goes without saying that a good many of them are about women and their ways. And there are sentences among them that many a woman might read with profit, even if she didn't relish the characterization.

A charming Christmas book reaches us from Lee and Shepard—"The Wooing of Grandmother Grey," by Kate Tannat Woods, with illustrations by Copeland. The poem is pleasing, but the pictures do more than please, they delight. Quaint, homelike interiors, lovely winter scenes, pretty groupings around old time hearths, winning faces, and the sweet looks of Grandmother Grey herself, arrest the reader as he turns the heavy leaves. It is an idyl of old-time, told with exquisite faithfulness by both pen and pencil.

Boys and girls with an appetite for the wonderful, and most of them have it, will enjoy "The Adventures of Little Baron Trump, and his wonderful dog, Bulger." It will afford entertainment for many a long evening. And all the pictures are the quintessence of fascinating grotesqueness. And the booklets, what art is expended on them! One for Christmas, another for New Year, and an 1890 calendar beside, I note. The booklets are lovely, with dainty designs in delicate tints, and appropriate selections of verse accompanying them. They are printed on ivory cardboard, of peculiarly satin-like texture and finish, have gilt-edges, and are ribbon tied, with silver chains. And the calendar is even prettier, with its odd, fanciful designs and comical child faces. J. Pauline Sumter is the artist, and her skill in work of this kind has been many times demonstrated. All the three are of convenient size and graceful oblong shape. They usher in the happy season of gift-making auspiciously.

Roberts Brothers' announcements are inviting, and the books themselves more than fulfill the promises of their prospectus. All the autumn issues of this house and their holiday issues are numerous and noteworthy, are books of permanent worth. First and foremost, because by many of us eagerly anticipated, is "The Life and Letters of Louisa M. Alcott," by Ednah D. Cheney. The book is even more fascinating and suggestive than was expected. Some of her experiences and observations are irresistibly laughable; her struggles are heroic, with much pathos in them, and the suggestions and encouragements of her brave career, invaluable to women-workers everywhere. Of these more serious lessons of her life, and of some of the truths she taught, writing, working, waiting, living, I would like to talk with the RURAL readers more at length, by-and-by.

A posthumous volume of hers, "Lulu's Library," appears simultaneously with the "Life." It is designed for children, but its juvenile title hardly does justice to the wisdom, shrewdness and sweetness which commingle in the nine wholesome stories of the pretty blue-bound book—stories that older "Lulus" might read with profit.

The opening chapter of "Recollections of her own childhood" is characteristic and entertaining.

When I read "Just Sixteen," as the title of "Susan Coolidge's" last book, I supposed it meant 16 years, of course, and was very likely about a girl, or girls, of that age. But lo! it means no such thing, this taking title. It is given because there are just 16 stories in the volume. "Susan Coolidge"—I believe her real name is Sarah C. Woolsey—is known as the author of all the charming "Katy Did" books, of "A New Years' Bargain," "A Little Country Girl," and many other stories. Her pen-name is also familiar as appended to some of the most helpful and beautiful religious poetry of the day.

These 16 stories are as entertaining as one would expect them to be, coming from her pen. They carry, too, a good many lessons that young girls will be both braver and tenderer for heeding. The first one is of "A Little Knight of Labor," and is especially good. "A Balsam Pillow" affects to tell the story of the very first of that fruitful, fragrant family. "The Do Something Society" has a lesson for those young people who are fond of giving and of helping, yet who expect really to but pass on, transformed a little, the pennies from Papa's or Mamma's purse. A better way is pointed out. And "Ninety-Three and Ninety-four" compares the experiences of two girls in renovating their rooms, and making them pretty with a little money.

In their "Famous Women" series, the same publishers bring out "The Life of Jane Austin" one of the most interesting characters treated of in the series. Her work seems not unlike that of her New England sister-author, Miss Alcott, the charm of the books of both consists so largely in their unstudied naturalness, while both found the material for their stories usually close at hand. The biography is likely to do more than its author modestly hopes it will accomplish—make Miss Austin's books even better known and more highly appreciated" though that, too, is to be desired. There appears, too, a novel, by Louise Palmer Heaven, "Chata and Chinita," a Mexican romance. While for the children comes one big enough and bright enough to be a half-dozen books in one. "Grandma's Rhymes and Chimes" is its title. Do any of my readers ever wish their childhood had fallen in these fortunate days? And wasn't one chief cause of that futile regret the delightful books gotten up just for the little ones? Such pictures, such stories, such songs as are made for them! All three, songs, tales, pictures are here. I might tell of at least two grown people who couldn't resist reading it through and found it vastly entertaining. But grown-folks must not be ashamed of reading "The Kingdom of Coins" by Bradley Gilman, although illustrations are comically grotesque, and both they and the story, to the last page, savor of Wonderland. I suspect its precepts we all ought to heed, and perhaps need to be reminded of; they belong to the worrying, wondering work-a-day world, though the adventures prove to have been "all a dream."

HOME GOVERNMENT.

J. H. G.

WHILE it is undoubtedly true that very much that is good in American home-life has come to us from our English ancestry, yet in some things we have done well in departing from the traditions of our fore-fathers. The autocratic bossism of the English husband and father is intolerable in this land of freedom. The father should command, if he commands at all, because of his superior knowlege and experience, not because of any special prerogatives which belong to his relationship to the family. The divine right of Kings is not recognized in this country; neither is the divine right of the husband and father. It may be said that in many instances paternal or maternal authority is not respected as it ought to be, but I think the cause is oftener due to its excessive severity exercised than to the mildness of the home rule. The exercise of power in a harsh, despotic manner, is not nearly so apt to command obedience as the practice of firm, judicious advisement.

An English authority, Mrs. Mallison, speaking through the Bradford Observer, asks in how many households do we see the earliest and rudest form of government prevail when it should have given place to another more liberal? How often do we see the will of the man. who is strongest by physical force, ruling, and perhaps crushing, the very life of the dependent members? In such homes no discussion is allowed "My son must go into the work I get for him, or he shan't stay at home;" "I won't have my daughter waste her time over those evening classes;" "I don't choose," —such and such a course of action being held sufficient reason for decision. In such households the gentle, loving mother often stands an unhappy witness of conflicts between possible harmless wishes of the children and the despotic love of power, ruling for the sake of ruling. Many an English father who. in the pride of his heart, declares that "his house is his castle," acts the despot to his family in a degree he would not tolerate from those who govern him. In other homes we see the growing children allowed more liberty of deciding and acting for themselves, and the government of the family running on easier lines. Here the rule of arbitrary power gives way to the government which attempts, at least, to consider the happiness of those governed, and endeavors to get reasonable and willing co-operation. This we may fairly regard as the second stage of family government. For a long period in the life of the home this probably provides for the interests of the governed in the best possible way; but we often see it outlive the period when, in healthy life, it should give place to still freer forms of rule. In such families we do not lament over the lives of their young members spoiled and crushed by the will of one overpowering ruler, but we often see sons and daughters living in a state of tutelage, as though they had not arrived at manhood or womanhood. In such families we may see a son with strong tastes and ability in one direction thwarted in the employment of these by a father who wishes him to exercise his powers in some other way. A boy with the tastes of an artist is forced to go into trade as a butcher or saddler, where his perception of form and color has no

exercise; a son who loves open-air work is condemned to live in towns and labor at a desk. The man who would have made an excellent painter or designer makes a very indifferent and unhappy tradesman, the would-be farmer a discontented clerk. We may see too, in other homes, a house full of women kept idle by the, perhaps altogether gentle, though unwise will of the father, who does not "choose" that his daughters should go out into the world, and in stifling their desires of independence and activity is exercising his despotic power as governor.

BREAD-MAKING.

SWEET FERN.

YEAST BREAD NO. 1 WITH YEAST.

I HAVE tried many methods of making bread, but none can compare with the following, either in the quality of the completed article or in the ease of its preparation: To make the yeast (which will keep for three weeks or more) take a quart of potatoes mashed fine, four table-spoonfuls of sugar and two of salt, put in a kettle over the fire with two quarts of boiling water, add slowly eight table-spoonfuls of flour, previously moistened with water, continue to stir till well cooked and thick, remove from the fire and add two quarts of cold water and two yeast cakes. Let stand in an earthen jar in a warm place till light, which will be in five or six hours. If a pint of the yeast is left for the next making, using only one yeast cake, it will rise in a little over *two* hours. Do not attempt to keep it in an air-tight vessel. The bread is made as follows: Take a pint of yeast (well stirred) to a loaf of bread, do not sponge, but stir in flour till very stiff, then knead until it is smooth and will cleave from the board; put in the bread-pan and when light—which will be in about two hours—form into loaves. These will be ready for the oven in a little over an hour. If you wish it to be out of the way very early, knead the night before and set it in a cool place to rise—in the cellar in warm weather.

Yeast bread may be put in a warm place to rise, but there should be no direct heat. It is a good plan to warm the flour in cold weather.

YEAST BREAD NO. 2 MADE WITHOUT SOFT YEAST.

Put in the bread-pan at noon, about two cups of mashed potatoes, (nothing equals the Henis fruit strainer for mashing potatoes, it is the same as pressing them through a colander) add a little salt and sugar, as much cold water as is required—a pint to a loaf—and no more than one-half a yeast cake, (there is but little choice between any of the reliable yeast cakes on the market, providing they are not stale) stir in enough flour to make a stiff batter, cover and set in a cool place; it will be light at night; add flour and knead quite briskly for five minutes; put back in the pan; set in a cool place. In the morning form into loaves; let rise and bake; it will be out of the way as early as can be desired.

BREAD CAKE.

One tea-cupful of bread dough, one cup of sugar, three table-spoonfuls of butter or lard, two beaten eggs, half a cup of raisins, spices to taste, flour enough to make a stiff batter, let rise and bake.

SALT-RISING BREAD.

Although one may not especially fancy "saltrisin'," it makes a change and is to be preferred if the flour is poor, as the quality of the flour when the bread is made in this way does not make nearly so much difference as it does in the case of yeast bread. The methods of making are too numerous to be mentioned: The following will be found as reliable as any and it gives as good results: put a pinch of salt, sugar and soda in a tea-cup, fill one-fourth full of very warm water, stir stiff with canaille or if that is not to be had, three table-spoonfuls of Indian meal and enough flour to make it very thick, set the tea-cup in a bowl of hot water, put in a warm place, being careful not to scald. If set at noon, it will be light at night. Set it in the cellar till morning, or, if set at night it will rise to the top of the tea-cup by morning *if kept warm*. Before breakfast, pour enough hot water into a quart bowl to fill it one-fourth full, add a pinch of salt, sugar and soda, and flour enough to make a stiff batter, and, last, beat in the rising or "emptins" from the tea-cup. Set the bowl in a dish of warm water; the contents will rise to the top of the bowl in about three-quarters of an hour; then pour into the bread-pan, add sufficient water for the number of loaves required; sponge if you wish, but it is just as good stirred stiff and moulded into loaves, being careful to mix it as soft as possible. Set to rise in a *warm* place with *no draught*, it will be light in two hours. Do not let it rise as light as yeast bread, as it will run over. Bake about one-half hour.

When bread is taken from the oven, rub the crust with a buttered cloth and turn on the side, or crust downwards, cover with a bread-cloth to steam. Bread keeps sweeter in tin than in anything else; nothing is better for this purpose than a clean, bright wash-boiler.

GOLDEN GRAINS.

TO be silent, to suffer, to pray, said Fenelon, when there is no room for outward action, is an acceptable offering to God. A disappointment, a contradiction, an injury received and endured for God's sake, is of as much value as a long prayer; and time is not lost which is spent in the practice of meekness and patience.....

SEE that your child never leaves any task half done or slovenly finished; and therefore give not too many tasks, says the Christian Union. Thoroughness is the corner-stone of success. There is no place in the world now for smatterers, who know a little and only a little, of everything under the sun. There is always an honorable place for those who can do any kind of honest work in the best manner.....

CONTENTMENT with one's opportunities and circumstances as good material and tools with which to work is one of the happiest conditions into which a man can bring himself; but contentment with what one has done and achieved as the full measure of his work always marks the end of growth. When the energies pause, and the worker settles down, he may find comfort and ease, but the inspiration of the great struggle is no longer with him; his real life is finished unless he takes into some other field that energy which has secured him success. Not to rest content with the winning of any goal or the doing of any work is the duty of every man who wishes to get and make the most out of life. For the real joy of living is to be found, as the greatest of teachers long ago said, not in receiving but in giving. The real joy of life lies in the putting forth continuously of one's whole strength, lies in the consciousness that one's nature is steadily expanding by use.....

STEADY work for the love of it, and for the satisfaction and peace which it brings, never breaks the worker down. On the contrary, it so weakens temptations from without, and so destroys inferior ambitions and desires, that it gives the whole nature steadiness and poise. It is the best cure for restlessness. The joy of life for strong natures lies in a noble activity; a work adequate to the aspirations of the soul; a work that brings calm by its magnitude, and by its very demands evokes the best and greatest in us.....

ONE may be better than his reputation, or his conduct, but never better than his principles .....

PRAY for others in such forms, with such length, importunity and earnestness, as you use for yourself; and you will find all little ill-natured passions die away, your heart grow great and generous, delighting in the common happiness of others, as you used only to delight in your own.....

THE sun should not set upon our anger, neither should he rise upon our confidence. We should freely forgive, but forget rarely. I will not be revenged, and this I owe to my enemy; but I will remember, and this I owe to myself .....

EVERY solitary kind action that is done the world over, is working briskly in its own sphere to restore the balance between right and wrong. Kindness has converted more sinners than either zeal, eloquence or learning; and these three never converted any one, unless they were kind also. The continual sense which a kind heart has of its own need of kindness keeps it humble. Perhaps an act of kindness never dies, but extends the invisible undulation of its influence over the breath of centuries.....

SILENCE is not golden when it falls frostily upon the little ones, ignoring their efforts to please, and showing them practically that they are of small account in the eyes of their parents and teachers. What a pity it is that we are so chary of praise when praise is so often the oil which causes the household machinery to work without friction? It is so easy for some of us to blame, so hard to utter the generous approval.....

WHO that knows what life is can expect to be perfectly happy? Go, clad in an armor that will enable you to defy the assaults of envy; carry your sun with you, and have your world within yourself where you are both law-giver and judge....

BE to yourself forever true; know for the rest, God cares for you .....

There are profound sorrows which remain stored in our souls, and which we always find there when we are melancholy...

Domestic Economy

CONDUCTED BY MRS. AGNES E. M. CARMAN.

Shut every door that leads to prosperous life,
He still hath hope who hath a helpful wife.
I liken woman to that modest flower
Which bends its head before the gentle shower,
But when the forest by the storm is lain
Looks brightly up to beautify the plain.
—C. E. Banks in Youth's Companion.

If you give because you feel that you MUST, *don't do it. The gifts that carry with them thoughtful kindness, friendship, love, are the ones most appreciated.*

"GOOD-WILL" SUGGESTIONS.

BELLE'S CHRISTMAS GIVING: INEXPENSIVE BUT USEFUL.

IN our household, money has been a "skurser" article than usual. Mother said when she saw how "cramped" we should be after getting our winter "must-haves," that we really could not make any Christmas presents this year, as times were so close. But Belle went to work when the first cold snap came, saying that Christmas comes only once a year, and that she meant to make a few presents any way. For a dear, invalid friend she cut 20 pieces of cream, blue, rose and gray paper-cambric the size of a page of sheet-music, pinked the edges neatly, then pasted upon these leaves comforting texts, bright bits of poems, and a few dainty pictures, birds and flowers, finishing with a ribbon loop to hang up by.

Another friend who has a beautiful home and everything she "fancies," was brought back to the scenes of her childhood when Belle's present was received—a vase covered with gray moss and scarlet bitter-sweet berries. The vase was only a brown stone jar, and a cracked one, but the gray moss was thickly glued over it, and the bright berries, with a few sprays of pressed fern tastefully arranged, made a gift not to be despised, though it cost nothing but a little work.

For a young girl who toiled for bread in a crowded city, and had little to cheer her, an old-fashioned butter bowl, (a cracked one which mother had laid aside) was filled with paper cut fine, then over the flat top prepared green and gray moss was gummed, and the outside of the bowl was covered with pine cones, twigs and tufts of gray moss. Then a cross was made from two laths, wound with the gray and green moss, pine twigs and bitter sweet berries, and suspended or hung directly over the bowl of moss. Bunches of bitter-sweet berries, with snow-white shells were sprinkled thickly over the moss.

For a young house-keeper who had never learned to cook, a "cook book," containing only well-tested and original recipes, suited to the purse, and culinary skill of the often discouraged young woman, who never imagined "getting enough for Richard to eat," would prove such a task. The leaves were cut from a stiff yellow wrapping paper and folded at the top so that the "book" might be hung over the kitchen table and easily handled. There were more recipes telling just how to make palatable dishes from leavings, than fancy pastries, and Arie Belle said she felt more than compensated when a good neighbor, and a "man," too, said "Brown's wife seems to do better now, with the provisions he carries in. I don't have to walk over cold vegetables, bread, and scraps of meat, as I come up the alley-way next their house. I used to think when I'd see good bread and meat thrown out, no wonder Brown never had a good suit of clothes. My wife always said she was a good little woman, anxious to learn."

For a dear, old "body," who has her second sight, but few good things to read, two thin pine boards were sawed just the size to hold papers and magazines; on the edges meant for the back, gimlet holes were bored two inches apart, through which the cord might be laced. The boards were papered with dark, pretty wall-paper, and the front edges were tied together with a bright ribbon. A neighbor kindly gave us some copies of magazines to put in our "holder."

For a little "chore" girl, who had no "folks," and lived with an old couple who could spare little of their substance, an apron was made from a scrim window curtain. The holes were cut out, and a pretty pattern was chosen, Ann's face beamed with surprise and delight when she learned the pretty apron was really for her.

For a young girl who possessed dainty tastes, and "roomed," but worked early and late in a factory, two pretty oval mats for the "mantel-piece" were made from creamy white cotton-batting, (the sheet wadding.) Cut the foundation of any desired size, and it may be oval, square, hexagon or round, then make a box-plaited ruffle two inches wide, button-hole-stitch the ruffle to the foundation and the upper edge of the ruffle with any colored zephyr desired, scarlet or rose is pretty. The ruffles must stand up around the foundation, and one, two or three ruffles may be used. They are very cheap and pretty.

For the wife of our pastor, who has a cabinet organ, Belle made of shaded yellow and of purple zephyr a pair of pansy mats for the lamp stands, which were much admired, and really did look like the real "posies."

Crochet plain stitch, blending the shades as best you can, little round wheels, the size of a large pansy, then sew a ring of them around the center, another around that, and when the mat is large enough stand up the border wheels and sew them to the mat. If the wool is nicely shaded all the yellow and purple pansies may be fairly imitated.

For a tired, hard-working woman, who had about her a growing family, a half-dozen napkins made from coarse unbleached cotton; but neatly hemmed and each child's initial worked with red cotton in the corner, were fashioned, though the offering was timidly made, as the cotton was only the covering of canvassed hams, carefully washed and cleansed.

"I don't think Mrs. Clare will mind the cheapness of our gift; she'll know we'd gladly give a better one, if we had the means," said sister, humbly, as she folded up the last napkin marked with a big J. for Johnny. The children were delighted with their napkins, while Mrs. Clare, said one day: "Them children *will* have their napkins every meal an' I've come to find it's no savin' of work not to use 'em, as then the table-cloth keeps nice. I used to think napkins too nice for any body but the "tippies."

"For somebody else, we made a work bucket instead of a basket to hold the many damaged stockings, aprons, etc., and it was both convenient and looked nice. Take one of those large buckets that candy or fine-cut tobacco comes in—cost about 10 cents—wash off the labels and rub smooth with sand-paper; then paint the bucket and the lid any desired color, after first screwing some sort of a knob or handle on the lid to lift it by. Our bucket was stained walnut, then decorated with bright pictures—plums, oranges, apples and peaches. Around the lid a border of autumn leaves was gummed, and then a coat of varnish was given the whole.

Since then we have seen for a young girl's room a very beautiful one rubbed very smooth and painted a cream-color, with a bright vermilion border one inch wide at the top.

Another lady, who used her "bucket" for

Miscellaneous Advertising.

When Baby was sick, we gave her Castoria,
When she was a Child, she cried for Castoria.
When she became Miss, she clung to Castoria.
When she had Children, she gave them Castoria

holding letters, bills, etc., and did not want to get a can of paint, papered it with dark-blue paper, adding a picture of pansies, callas, and blush roses. This was very pretty and cheap.

For another friend who must spend much time in her room, we rooted a white lily, not a calla. For the pot, we picked up in an alley a powder keg, about one foot deep and seven inches across. It was badly rusted inside, but the outside was in good condition. Some small holes were punched in the bottom, and a coat of green paint was given to it, and we were able to carry a thrifty plan to her one gloomy, wintry day, which would bloom before the snow departed.

Belle made a quaint, pretty hand-mirror, from an old broken looking-glass, by having a piece cut, triangle-fashion, then framing it in thin wood and royal purple.

A number of periodicals for which sister contributes, have sent quite a large assortment of bright and pleasing chromos. We could not afford to buy frames for them, but thought some of them would carry a little brightness into several darkened homes, so we selected some of the darkest ones, prepared for the top and bottom a thin strip of wood one inch wide, and an inch longer at each end. This was covered with plush, vivid scarlet for the darkest picture, wine or maroon for the lighter ones. These strips were fastened to the pictures and a loop of ribbon to hang by, matching in color the plush, finished it. For bed-rooms these chromos are very effective. Where pictures of this style are so plentiful, one does not care to buy frames; by using the satin or plush-covered strips, one may make use of them satisfactorily.

For a little boy who dearly loved dumb animals, Belle made a scrap-book of paper cambric leaves, dark blue and red in color, pinked or notched about the edge, filling it with pictures of cats, dogs, horses, cows, wild animals, fowls, birds and fishes, and pasting in as many descriptions of the creatures and their natures as she found. For a little girl pictures of celebrated women and their work, were carefully selected by sister who said: "I want to foster in Charlie the love he now has for dumb animals, and to plant in little Lou's heart a love for the good and noble of her own sex."

The simple gifts were not all given on Christmas Day, or even in holiday week. The giving began before and was kept up pretty much all winter, and Belle kept treasuring every available bit of anything that could be worked over into something useful or ornamental, saying: "Silver and gold I have none, but such as I have I'll freely give."

It's the "heart gifts," and not the show ones which are most appreciated by even those who have a goodly store of the world's good things. ELLA GUERNSEY.

ALWAYS acceptable to a woman—a dainty apron.

SOME AFGHANS.

AN afghan is a comfortable and useful thing to have about the house, even if one doesn't own a carriage. It is handy to throw over one when taking an afternoon siesta; to throw across the foot of the bed if the feet be cold; to wrap around the body when passing through long, cold halls, such as one often finds in country houses. A good, comfortable afghan may be made at very little cost. Germantown wool, which can be bought by the hank at a very reasonable rate, will do quite as well as more expensive zephyr for one of these household comforts. Red and black are good colors to select as they do not fade and grow dim as soon as lighter and more delicate shades. To make a plain, serviceable afghan, crochet (afghan stitch) five strips, 10 inches wide and the desired length. (I like a square afghan best, and if you do also, make each strip 50 inches long.) You may make three black and two red, or *vice versa*. If you have three red it will be somewhat brighter. Down the center of the black strips embroider in cross-stitch, as one does on canvass, a vine of flowers, two or three butterflies, or anything that suits the fancy. Join the strips together with a chain stitch, or, if you like, railroad stitch, using old gold wool. Make a row of old gold, plain stitch, all around the entire afghan. Then make a fringe about five inches deep around the whole. You may make the fringe of clusters, say five black, five red, then five black and five red again, and so on, or you may make them alternate—one of each.

Another pretty afghan may be made of the same colors only arranged differently. Crochet, (afghan stitch) a large square of black—say about 30 inches square. You will require a long, wooden needle for this. Next crochet four strips of red the same length—30 inches. They are to be fastened to the sides of the black square, chain-stitch. When you have done this you will find that there will be four empty spaces at the corners. Crochet a square of black to fill these. This is done by making the square the exact width and length of the *width* of the side strips. Join with old gold. A wreath of flowers embroidered in the black center-piece, with the initials worked in the exact center (in old gold) is very effective. A rose bud may be embroidered in one corner, a daisy or two in another, a lily in another and carnations in the remaining one. Border with a fringe.

A dainty pretty afghan for baby's use may be made as follows. Crochet one strip (either in afghan or shell stitch) of white zephyr nine or 10 inches wide, and the desired length Embroider daisies of gold with white hearts down the center of this strip. Then make two more strips, of the same length and width, of a delicate blue. Embroider daisies of white with golden hearts down the center of these. Place the white strip in the middle with a blue strip on each side: join together with gold railroad-stitch. This forms a rich chain where the fastening comes. Make a border of some open stitch which will permit a ribbon of delicate blue or gold to be run in and out around the entire edge. If you prefer you may fasten the strips together or the ribbon may be run in and out where joined. Finish with a fringe four inches deep. Make in clusters, say six blue, six white, etc

Another dainty afghan may be made of white basket cloth. Cut the cloth the desired size. Then have the edge scalloped in deep points, each point being "pinked." In the center embroider a wreath of daisies and forget-me-nots in Arasene, or, if you prefer, daisies and wild roses. Sew a frill of Torchon or Antique lace around the edges so that it will fall in a ruffle beneath the scallops. If you have forget-me-nots make a large bow of pale blue ribbon and fasten to the upper right-hand corner of the afghan. If you have wild roses make the bow of a delicate rose pink. These last two are delicate and will not stand hard usage without becoming soiled. You may use more serviceable colors, but follow the general instructions and have pretty and doubtless more useful afghans.

DORA HARVEY VROOMAN.

A ROSE jar filled with dried rose leaves and fragrant spices, makes a charming gift.

CHIPS.

"O, HOW good that sounds;" exclaimed a lady visitor, as the sound of the ax was heard at our kitchen door. "I almost envy those who have nice chips to resort to when they wish a quick fire; I never go through the woods where men have been chopping without a pang of regret that such excellent kindling is allowed to go to waste; that I have not even a basketful of it at home." I herewith offer this basket of chips from the woods hoping some of them may be a means of giving comfort and warmth to the rooms of our readers during the long, winter months.

The bright autumn leaves should be ironed till dry with an iron just hot enough not to "blister." A little beeswax rubbed on the iron brings out and preserves the brilliant colors. A cluster of red and yellow maples glued on a black frame and varnished is pretty. Then there are the ferns which retain their color so well when pressed, while they are unsurpassed for "spatter-work" pictures. This is so simple yet so amply repays the work, that I venture a few directions, though, doubtless, many are familiar with it: arrange the leaves as desired, on white card-board. With a brush (an old tooth-brush will answer,) rub ink through a fine sieve over the whole surface, in fine spatters—the finer the more pleasing the result. Where shading is desired, remove a leaf or half of one after the card-board is partly covered with ink, and continue the "spattering" process till the picture is dark enough

Remove the remaining leaves and you have a work that resembles a fine steel engraving. A handsome design is a cross and crown. These figures are cut from paper and arranged with leaves. At the foot of the cross, which is nearly white, are ferns and flowers. The crown above is dim, the paper having been removed early in the process. Light easels are made of cat-tail-flag, leaving the heads on top. For a cabinet picture, a rustic easel constructed of apple tree twigs gilded or varnished is pleasing. It may be ornamented with acorns or beech-nuts.

Chestnuts gilded and strung on narrow ribbon form an inexpensive gift, though one perhaps too suggestive to one addicted to relating worn-out jokes. The lichens which abound on old logs must not be overlooked. They should first be thoroughly dried; then a snow scene painted on the white surface, and the rest varnished, transforms it into a "thing of beauty." One unskilled with the brush may obtain surprising results in a simple pencil sketch—done not with a pencil, but scratched with a pin. RUTH RAYMOND.

"GIRLS, let's club together and get mother that comfortable, willow rocker that she spoke of seeing at K——'s last week, for her Christmas present."

REMEDY FOR DAMPNESS ON WALLS, ETC.

Referring to an item in the R. N.-Y. of October 31st, giving the scientific reason for the loss of wall papers and damage to books through the dampness which has so largely prevailed in this part of the country, I thought my experiment might be adopted with success by others. My house is a large old-fashioned stone building with a slate roof which had been neglected by the owners until the walls were already damp. I had the roof repaired and a roaring wood fire was made in the furnace immediately after every rain. All windows and doors were shut until the rooms were well warmed: then every opening that would cause a direct draught was made. My neighbors thought me a little daft but there is not a loose or faded piece of paper in the house, nor are there any moldy odors or damaged clothes, and no books have been injured since the first fire was built. It was my first year in the country and I did not know what to do, but my original idea proved to be the correct one.

Nordhoff, N. Y. MRS. A. ELMORE.

News of the Week.

HOME NEWS.

SATURDAY, November 16, 1889.

AT 1:45 P. M. Friday, November 8, Col. William Cassius Goodloe, Collector of Internal Revenue of the Seventh Kentucky District, and Col. Armstead W. Swope, ex-Collector of Internal Revenue under Hayes, both among the most prominent leaders of the Republican party in Kentucky and highly esteemed and honorable men, but bitter political rivals, met in the post-office at Lexington, Ky., and after fiercely glaring at each other and uttering some angry words pitched in with chivalrous savagery to kill each other. Goodloe, 48 years old, a member of the Clay family, was armed with a clasp-knife, the traditional weapon of the Kentucky Clays; Swope, 50 years old, a native Kentuckian also, was "heeled" with a pistol. Swope fired first, hitting Goodloe in the abdomen. The latter then fiercely carved his antagonist and, though receiving another shot, in a few moments inflicted over a dozen cuts on him before he fell on his face and died. With the coolness and bravery of his race Goodloe waited inevitable death till the following Sunday, when, after joining the Episcopal Church, he died surrounded by his weeping family and friends at the hour when Swope's body was being lowered into his grave. Both were good men; neither would be guilty of an ungentlemanly action; neither wanted a fight; but both were prepared for one, and through a false, semi-barbarous code of honor each became at once a murderer and a victim, plunging the families of both into distress and their hosts of friends into sorrow. The terrible lesson is sure to produce good, but at what an appalling cost!..... Last Monday President Harrison completed the work of converting three Territories into four States by issuing a proclamation admitting Washington into the Union. Montana was admitted the previous Friday, (November 8) and the two Dakotas on November 2. There are now 42 States in the Union, the original 13 having more than trebled. For 13 years the number had stood at 38—since August 1, 1876, when Colorado, the "Centennial State" was admitted. How long until other stars shall be added to the flag? Wyoming, with all requirements, is loudly knocking at the door already; Idaho is much better fitted to be a State than Nevada; Utah would already have been a State were it not for Mormonism; New Mexico—well New Mexico, why shouldn't she too soon join the Sisterhood?..... The Catholic Centennial Jubilee, commemorative of the 100th anniversary of the establishment of the Catholic hierarchy, or form of government of the Church in this country administered by the bishops and clergy, opened with great splendor at Baltimore last Sunday. Over 1,000 prominent laymen from all parts of the country and an extraordinary gathering of church dignitaries lent force and solemnity to the occasion. Many eloquent speeches were made, but that of Honore Mercier, Prime Minister of Quebec, and the most prominent French-Canadian delegate, has created the greatest sensation. He spoke glowingly of the extraordinary increase of the French-Canadian population in the Dominion and the Union. He expects they will become, ere long, the dominant race in Canada and New England. There is among them a strong and growing desire for annexation to the United States or at least ultimate independence of British rule. The immemorial antagonism of the French and English races has become deeply embittered in Canada by the exasperating stimulant of active religious hostility. The Protestants are loud in threats and the Catholics equally emphatic in defiance, and the future outlook is by no means amicable.. ..... According to a decision just rendered by the Supreme Court, N. J., a law passed in 1878 is unconstitutional, though under it the boroughs of Sea Island City, Somer's Point, Ocean City, Avalon, Anglesea, Holly Beach, Cape May Point, South Atlantic City, Beach Haven, Barnegat City, Lavalette, Point Pleasant and Atlantic Highlands were incorporated. These are all in debt, the outstanding bonds aggregating over $250,000. This indebtedness will be worthless unless the N. J. legislature shall pass a law rectifying all mistakes..... Boston capitalists have made preparations for sinking wells on the south shore of the Gulf of St. Lawrence in Canada, expecting to develop a rich oil field there. Boston refiners having been driven out of business since pipe lines were laid from the Pennsylvania oil regions to New York, Philadelphia and Baltimore, expect to get a fine supply of Canadian oil near home..... All the Philadelphia oil refineries have passed into the hands of the Standard Oil Trust, and the Pennsylvania Railroad Company proposes to discontinue carrying crude oil. The oil-producers of Western Pennsylvania, therefore, find themselves at the mercy of the Pipe Line Monopoly controlled by the Standard. It is said that to escape from oppression, they have raised $6,000,000 to build an independent pipe line to some point on the Atlantic coast. The route of the line has not been disclosed lest the Standard should succeed in blocking the project.....Owned personal property—chiefly cash and bonds—to the amount of $628,989.95 and still committed suicide the other day! Surely Oliver Garrison, lately of this city and formerly of California, brother of the late Commodore Garrison, must have been crazy to be guilty of so big a folly and so unexpiable a crime..... Astonishingly large as the desertions from our army are, those from the Marine Corp are still larger. Out of 1,823 enlisted men 515 deserted last year—considerably over one-fourth!.....It appears that the greatest Democratic gains in the recent elections occurred in rural districts. This being an "off" year in politics, it is claimed that the farmers, not feeling themselves constrained by party ties, voted according to their convictions. Even in Ohio where the Democratic party and candidate for Governor openly made the campaign on the basis of "free wool," large Democratic gains were made in country places. The anti-Tariff feeling is said to have helped the Democrats in the country, and the anti-Prohibition feeling had the same effect in the towns.....Dave Wambold, the well-known "negro" minstrel, died in this city last Sunday night, aged over 50. He left between $75,000 and $100,000.....Volapuk, the "universal language," is gaining ground in this country and elsewhere. More than 2,000,000 people are now studying it; 2,000 books have been published on it; 30 periodicals are devoted to it, and 600 societies for its advancement have been organized—so say its advocates.....The first sod of the Nicaragua Canal was formally turned on October 22. Much of the preliminary work in the way of clearing the route, laying down a railroad for the transportation of men, supplies and materials, and setting up a telegraph line, has already been done in a business-like manner, and the outlook is good..... In Ohio the auction for the seat in the U. S. Senate now occupied by "Standard Oil" Payne, is quite brisk. Calvin S. Brice, millionaire Chairman of the Democratic National Committee, and millionaire manufacturer Thomas, of Springfield, are now the most likely bidders.....Ellis, a Texas negro, is striving to obtain concessions of land from the Mexican Government for a large negro colony from the South. Many high officials favor the project; but the white Mexicans are generally against it: they think the Indian population is quite as much of an "off color" element as they ought to contend with..... A convention of the Knights of Labor has been in session at Atlanta, Ga., during the week. No officers are to to be elected: changes in the constitution and other matters alone claim attention. Federation with the Farmers' Alliance, Equal Wages for Women doing Men's Work, Children's Labor, National Banks and Governmental Control of Railroads and Telegraphs, were the chief topics discussed. The membership of the order has fallen off from 700,000 three years ago, to about 200,000; but it is claimed that the internal dissensions which were the main cause of this decline, have been eliminated, and that the order is now increasing and prospering..... In the National Women's Christian Temperance Union, which has been in session at Chicago during the week, there have been several discordant breezes, the gustiest of which arose from a difference of opinion among the members as to the advisability of the association taking an active part in "practical politics!" The majority voted in support of such a policy, whereupon the Iowa delegates withdrew. It is said that many ministers and other well-wishers are withheld from supporting the organization on account of its participation in "politics."..... The Western Union refuses to agree with the rates for sending Government messages fixed by Postmaster-General Wanamaker on October 30, last. It says that his reduction amounts to an average of 40 per cent., and that to do the business at that rate would entail a dead loss upon it.....The Pan-American excursionists returned to Washington last Wednesday, after just 42 days' absence, during which they had traveled 6,000 miles on the same train, drawn by the same engine, with the same set of officers—the longest trip ever made by the same train. All were greatly surprised as well as pleased with what they had seen and delighted with their treatment. After pleasure, work!..... The Secretary of State of Missouri warns the Missouri companies that have joined the Lead Trust, the Cotton-seed Oil Trust and the Linseed Oil Trust that unless they at once withdraw from the Trusts in compliance with the lately passed Anti-trust Law, he will straightway take measures to annul their charters. They'll probably withdraw.... ..All our window-glass makers are forming a "combine": "to lower the price of glass," they say, "by cheapening its manufacture;" "to raise the price of glass," the people know, "by forming a monopoly." The would-be monopolists are "protected" by an import duty ranging from 55 to 125 per cent. on competing goods from abroad..

FOREIGN NEWS.

SATURDAY, November 16, 1889.

YEARS ago the Boers of the Transvaal Dutch Republic of South Africa enacted a strong protective tariff. The country has of late been rapidly populated, and the Pretoria government made no allowances for the fact. Droughts have of late ruined the crops and destroyed vast numbers of sheep and cattle, so that a famine now prevails throughout the country. The government has abolished all tariffs on foodstuffs and established forage depots here and there and is giving bonuses to wagons bringing in provisions from the English possessions to the south. The government of Natal, the nearest of these, has offered a bonus of $5,000 to the first 50 provision wagons starting for Joannesburg, the center of distress, where food is now selling at famine prices. Recent rains promise to mitigate the destitution soon..... The new French Chamber of Deputies met Tuesday, with a Republican majority of 154, and a fair prospect of a harmonious session, as there is a healthy inclination for compromise among the warring factions of the majority.....Letters from explorer Stanley, lately received at Zanzibar, say that he and his party expect to reach that place by the middle of next January. They hadn't reached the place where Dr. Peters and his people were massacred, however, and their arrival at the coast may still be delayed by hard fighting. Assistance and supplies will be pushed rapidly forward by the New York Herald and the German authorities at Zanzibar.....

AGRICULTURAL NEWS.

SATURDAY, November 16, 1889.

THE proprietors of the Lakeside Stock Farm at Syracuse must be hard to please if they do not experience feelings of satisfaction over the numerous prizes won by the animals comprised in their herd of Holstein-Friesians. The animals have been shown only at the largest fairs in New York State, and have never been shown outside the State with two exceptions. At the New York State Fair at Albany, N. Y., the animals from this establishment won all the first and all the second premiums in the Holstein-Friesian class, except on two-year-old bulls, where they did not compete. The first was, however, won by a bull bred at Lakeside; they also won sweepstakes prizes on best bull and best cow of any age, also the special prize of $100, offered by the Holstein-Friesian Association for the best herd of Holstein-Friesians on exhibition. The firm also won the sweepstakes, seven first and two second prizes on Clydesdale horses; sweepstakes on French Coach stallion, and several first and second prizes on Percherons, Roadsters, and others. At the Buffalo International Fair, their stock also took a large number of prizes. Their bull Netherland Statesman took sweepstakes prizes for best male of any age. Netherland Prince and four of his get took first prize for bull and produce, besides which a large number of other animals took first and second prizes. In the Horse Department they were also very successful, entering stock in 17 classes, and winning 16 prizes, including the $600 prize for Clydesdale stallion and four of his get won by Rufus and his progeny. Besides the prizes won by the firm, large numbers of animals bred by them and sold to other parties, took high honors at the Bay State Fair, New England Fair, Rhode Island State Fair, Wisconsin State Fair, Illinois State Fair, and many other State, district and county fairs. The firm and the stock deserve all the honors received..... The New York State Dairymen's Association will hold its 13th annual convention at Ithaca, N. Y., December 10-12. A cordial invitation is extended to all, especially to women and young men. Suitable space will be provided for the exhibition of dairy products and utensils. Governor Hoard, of Wisconsin, Major Alvord, Prof. W. W. Cook, of Vermont, Col. Curtis and other noted dairy writers and speakers have promised addresses. Josiah Shull, Ilion, secretary.....The Kansas State Horticultural Society will hold its 23d annual meeting at Paola, December 3-5. All local horticultural societies are requested to send delegates. Space will be provided for the exhibition of seasonable fruits and horticultural products. Entertainment will be provided. G. C. Brackett, secretary, Lawrence.....The Dunellen Phosphate Company has been organized in Florida with a capital of $1,200,000. It is intended to develop 3,000,000 acres of new phosphate land in the State..... The United States Consul at Jamaica reports that an exhibition will be held on that Island during the winter of 1890-91, under government auspices. A large space will be given to exhibits from the United States, which will be admitted free of duty. The consul thinks the opportunity a good one for the exhibition of sugar machinery of American manufacture.....Secretary Rusk has just written a letter to the President calling attention to the fact that the House of Representatives failed at its last session to make an appropriation for the printing of the annual report of the Department of Agriculture.....The exports of pure-bred horses from England are said to be on the increase though the destinations vary considerably. The London Live-Stock Journal gives the distribution of the exports for the nine months ending September 30, as compared with the same periods in two preceding years as follows:

	1887.	1888.	1889.
Holland.....	$233,730	$250,945	$311,980
Belgium	386,575	377,180	383,195
France	125,160	356,910	360,510
United States...	240,495	338,425	283,060
British North America.....	788,365	969,755	764,200
Other countries.	414,655	1,001,225	1,640,475
Total..	$2,188,980	$3,304,440	$3,745,420

The value of the exports to the United States seems to have fallen off, while those to France, Holland and "other countries" have increased. The latter include the shipments to South America..... The California State Board of Trade have another train of three cars about completed and fitted out with the products of the State, which they will send throughout the eastern cities, to show the wonderful resources of their soil and climate.....The Association of American Agricultural Colleges and Experiment Stations has been in session at Washington during the week. Resolutions were adopted favoring the co-operation of the stations in the testing of varieties of fiber plants and machinery. The association called upon Secretary Rusk in a body at the Department of Agriculture, on Wednesday afternoon, and were entertained by him at his house in the evening..... The American Ornithologists' Union have been in session at the Museum of Natural History in this city. Papers were read upon various subjects connected with our native birds, their habits, migrations, etc.....

Crops & Markets.

SATURDAY, November 16, 1889.

THIS department has necessarily been very much contracted this week on account of a press of advertising and other matter.

There has been little change except that the prices of grain show a slight upward tendency. Reports from the West say that the corn crop has been greatly overestimated, both in yield and quality.
